INDEX TO 1929 N.E.L.A. BULLETIN

Volume XVI

A

"Accountant's Place in the March of Progress, The," by L. W. Clark, 147
Accounting National Section, 171, 331, 347, 797
Accounting Systems Machine for General Books and Records, 444
"Active Meters in Vacant Premises," by R. F. Bonsall, 603
Advertising Campaign, $2,000 Award for Industrial, 780
Advertising, Electrical, $1,000 Prize Again Offered for, 799
Advertising
  Public Utilities Advertising Association, 452
  "Study of Merchandise Advertising, A," by Keo Currie and Ray Warren, 703
Allen, A. E., "Westinghouse Lamp Company's New Lighting Institute," 290
American Electric Railway Association, 747
American Institute of Electrical Engineers, 180
  "Edison and the American Institute of Electrical Engineers," by F. L. Hutchinson, 570
American Society of Agricultural Engineers, 53
American Standards Association, A. E. S. C. Becomes, 53
Amplifier
  Be Damned if You Do and Be Damned if You Don't, 701
  Calls on the Professor, 25
  Considering Certain Obligations, 359
  Considers Conventions, 269
  Considers Industrial Migration, 419
  Considers "Kultur," 137
  Considers Rate Reductions, 219
  Constructively Iconoclastic or—Iconoclastically Constructive? 638
  Contemplating Rural Electrification, 487
  Human Sort of Person, A, 559
  Talks to a Distinguished Guest, 768
  Takes a Look at Agriculture, 90
"Another Anniversary," by John W. Lieb, 650
"An Association Periodical That Gets Results," by Maude Buchanan, 26
"An Outstanding Event in Radio History," by M. H. Aylesworth, 698
Andrews, William S., 504
Appliance Advertising, Seasonal Distribution of, 707
Arkwright, Preston S.
  "Light's Golden Jubilee," 356
  The President's Address at N.E.L.A. Convention, 333
  Address at Port Huron, 698
Association of Edison Illuminating Companies, Edison and the, 570
"Atlantic City, This is" by Clifton H. Howell, 273
Automobile Accident Classification, 497
Aylesworth, M. H., "An Outstanding Event in Radio History," 698

B

Bailey, Raymond, "Transformers and Regulators," 232
Baker, Alice M., "Woman's Opportunity in the Electrical Industry," 776
Barber, Claron D., "How to Increase the Usefulness of the Accountant in the Public Utility Industry," 480
Barnes, J. C., "Teaching Customers to Read Their Meters," 373
Barnes, Julius H., "This Half-Century of Unparalleled Advancement," 415
  Gives American Viewpoint on Ownership of Business Enterprises, 503
Barstow, William S., "The Pioneer," 549
Baylor, Armistead K., 599
Behind the Veil, by Ernest Greenwood
  "An Artist, A Queen and a Court Physician," 361
  "Civilization, Light and the Electric Arc," 581
  "Corralling the Incandescent Lamp," 632
  "Electricity and Communications: Part I, The Electric Telegraph," 783
  "First Civilized American, The," 421
  "God in the Machine, The," 711
  "Philosopher's Stone, The," 277
  "Science, Democracy and Frog's Legs," 483
  "Tears of the Heliades, The," 209
Benn, Sir Ernest, 345
Bennion, H. S.
  "Cheaper Wiring," 719
  "Far Reaching Significance of Power Plant Efficiencies, The," 55
Bill Delivery Policies, 792
"Bill Jones Idea," by G. I. Vincent, 505
Blackwell, W. T., "Street Lighting—A Much Neglected Source of Revenue," 213
Bonsall, R. F., "Active Meters in Vacant Premises," 603
Boynton, N. H., "The Celebration at Dearborn," 563
Brief Pilgrimage into Internationalism, 567
Buchanan, Maude, "An Association Periodical That Gets Results," 26
Busher, J. E., "Moisture-Tight Containers for the Shipment of Transformer Oil," 180
"Business of Selling Kilowatt-Hours, The," by C. E. Greenwood, 715

C

Carpenter, William Morgan, "Electricity: Index of National Prosperity," 133
Carty, John J., "Science and Progress in the Industries," 469
"Cashocka!" by Ed Dreier, 285
"Celebration at Dearborn, The," by N. H. Boynton, 563
"Changes in Format and Method of Handling N.E.L.A. Committee Reports," by A. Jackson Marshall, 722
"Cheaper Wiring," by H. S. Bennion, 719
Clapp, Paul S.
  "Electrical Industry and National Progress, The," 69
  "Public Utility Construction Program for 1930 Laid Before President Hoover," 765
Clark, L. W., "The Accountant's Place in the March of Progress," 147
Coal
  International Conference on Bituminous, 52
  Percentage of Increase in Electrical Output Five Times Increase in, 164
Codding, G. M., "The Philanthropy of Tree Clearance Programs," 92
"Code, Comments on the National Electrical," by A. R. Small, 426
Code, Conference of Company Representatives, 302
"Code, The Need for a More Liberal" by E. W. Lloyd, 427
"Code Situation, The,"
  by Irwin W. Day, 368
  by E. C. Stone, 424
Collier, C. A., "Competition—How Will It Affect the Utility Engineer," 19
Commercial National Section, 47, 331, 343, 372, 798
Committee Reports, Changes in Format and Methods of Handling, 722
Committee Reports, Routine Distribution of N.E.L.A., 774
Committees, 514
  Accident Prevention, 237, 420, 497, 610, 733
  Budget, 489
  Classification of Accounts, 229
  Commercial National Section Executive, 170, 343
  Commercial and Industrial Lighting, 798
  Customer Relations, 222, 792
  Electrical Advertising, 799
  Electrical Apparatus, 165, 230, 298, 445, 492, 608, 671, 734
  Electric Truck, 799
  Electric Water Heating, 47
  Engineering Research, 733
  Home Lighting, 799
  Hydraulic Power, 608, 609, 735
  Inductive Coordination, 21, 87, 378, 512, 736
  Industrial Heating, 28, 238
  Lamp, 108, 309, 389
  Light's Golden Jubilee, 276
  Merchandise Sales, 798
  Meter, 238, 737, 740, 801
  National Executive, 206, 665
  Overhead Systems, 46, 299, 513, 739
  Power Systems Engineering, 237, 511, 739
  Preferred Voltage Ratings, 235
  Prime Movers, 45, 167, 300, 512, 737, 802
  Public Policy, 330, 337

489549

  Public Relations, National Executive, 673
  Public Speaking, 700
  Range, 798
  Refrigeration, 798
  Special Engineering Research, 671
  Street and Highway Lighting, 799
  Underground Systems, 301, 518, 738
  Water Heating, 798
  Women's, 48, 110, 175, 244, 308, 386, 524, 526, 677, 745, 746, 812
Company Sections
  Duquesne Light Co. elects officers by popular vote, 788
  Metropolitan New York Section, 48
"Competition—How Will It Affect the Utility Engineer," by C. A. Collier, 19
"Complete Service," by Martin J. Insull, 473
"Consolidations in the Electric Utility Industry," by M. S. Sloan, 629
Convention, N.E.L.A., 1929, 105, 146, 197, 205, 261, 266, 325, 346, 351
Convention, N.E.L.A., 1930, 665
"Cooperative Competition," by C. Ernest Greenwood, 283
Cord, new standard announced for flexible, 747
Correspondence, 61, 109, 400, 453, 526, 789
"Correspondence for Good Will," by James F. Rice, 291
"Cost of Electric Service to Farmers," by Charles F. Stuart, 172
Cost of Living and Domestic Electricity, 297
Currie, Keo, "A Study of Merchandise Advertising," 703

D

Day, Irwin W., "The Code Situation," 368
"Depreciation Accounting Methods for Public Utilities," by L. R. Nash, 653
Dexter, B. D., "Design of High Voltage Outdoor Substations," 35
Doane, S. E., "1879 and Now," 651
"Domestic Load and Some of Its Problems from the Utility Standpoint, The," by H. C. Rice, 781
Dreier, Ed, "Cashocka!" 285
Duquesne Light Co. and Ground Breaking Ceremony, 84

E

East, H. T.
  "Pay Bills Here," 667
  "Records That Speed Service," 159
Easton, W. H., "The Edison Pioneers," 565
Edison, All the World Joins in Tribute to, 693
Edison, Einstein's Message to, 697
"Edison, Influence of, Upon His Associates," by Frederick A. Scheffler, 569
Edison—A Man for the Ages, 336
Edison's Message to the World, 697
"Edison Pioneers, The," by W. H. Easton, 565
Edison, Resolution to, 486
Edison Stamp, 357
Edison, Thomas Alva, A Symposium, 551
Edison, Thomas Alva, An Appreciation, 491
Edison's Protege, 577
Editorials, 7, 67, 131, 195, 259, 323, 403, 467, 547, 627, 691, 763
Educational
  Commercial School in Nebraska, 674
  Course in Electrical Household Equipment at Purdue University, 309
Edwards, Henry M., 666
"1879 and Now," by S. E. Doane, 651
Einstein's Message to Mr. Edison, 697
"Electric Arc Welding, The Erection of Buildings and other Structures by," by B. S. Havens, 593
"Electric Heat: An Economic Paradox?" by B. S. Havens, 151
Electric Light and Power Industry During 1928, 24
Electric Water Heater, 789
"Electric Water Heater, The," by H. Geo. D. Nutting, 641
"Electrical Advertising," by John F. Gilchrist, 85
Electrical Household Equipment, Short Course in, at Purdue University, 309
"Electrical Industry and National Progress, The," by Paul S. Clapp, 69
Electrical Leagues, 111, 112
"Electrical Leagues as Coordinating Units in Light's Golden Jubilee, The," by Kenneth S. McIntyre, 572
Electrical News Items, 57, 112, 177, 250, 314, 393, 457, 531, 618, 685, 753, 819
"Electricity: Index of National Prosperity," by Wm. Morgan Carpenter, 133
Electricity in the Household in 1890, 289
Employee and Consumer, 222
Employee Education
  Brooklyn Edison Company, 453
  New Orleans Public Service Company, 453
  New York Edison Company, 453
Employees' Help, Getting the, 727
Employees' Speaking Contest, 700
Engineering National Section, 237, 332, 349
"Evaluation of '1928' Prosperity," 164

F

Farm electrification, 27, 28, 172, 243, 313, 383, 386, 487
"Farm Power Survey—Full of Facts," by C. M. Ripley, 27
Ferguson, Samuel, "Promotional Domestic Rates," 409
"Fire Underwriters' Problem, The," by O. B. Ryon, 369
"Flexible Cord Problem, The," by Arthur P. Good, 661
Food Preservation Council, 366, 430
Forbes, B. C., "Honor to the Faithful Employee," 600
Ford, J. F., Accounting National Section Report, 347
"Far Reaching Significance of Power Plant Efficiencies, The," by H. S. Bennion, 55
Freeman, W. W., Public Policy Committee Report, 337
"Friendly Neighbor in a Time of Need, A," by J. B. Mahoney, 664
"Functions of Budgetary Control in Modern Electric Utility Management, The," by B. S. Rodey, 489

G

"General Electric Company Developments of 1928, Some" by John Liston, 93
Geographic Divisions
  Arizona Utilities Association, 305
  Canadian Electrical Association, 803
  East Central, 174, 381, 741, 803
  Empire State Gas and Electric Association, 107, 523, 676
  Great Lakes, 109, 302, 382, 742, 744, 751, 802, 806

OFFICERS—DIVISIONS—SECTIONS—BUREAUS—COMMITTEES—CONVENTIONS—MEETINGS—NEW MEMBERS

National Executive Committee

Officers

President, P. S. Arkwright
Georgia Power Co., Atlanta, Ga.

Vice-President, M. S. Sloan
The New York Edison Co., New York, N. Y.

Vice-President, W. A. Jones
Henry L. Doherty & Co., New York, N. Y.

Vice-President, J. F. Owens
Oklahoma Gas & Electric Co.,
Oklahoma City, Okla.

Vice-President, Marshall E. Sampsell
Central Illinois Public Service Co.,
Chicago, Ill.

Treasurer, P. S. Young
Public Service Electric & Gas Co.,
Newark, N. J.

Managing Director, Paul S. Clapp
National Electric Light Association,
New York, N. Y.

Secretary, A. Jackson Marshall
National Electric Light Association,
New York, N. Y.

Members-at-Large

(*Term expiring June 30th*, 1929)

H. T. Sands, *Ex Officio*, Electric Bond & Share Co., New York, N. Y.

C. L. Collens, Reliance Electric & Manufacturing Co., Cleveland, Ohio

G. E. Cullinan, Graybar Electric Co., Inc., New York, N. Y.

E. W. Lloyd, Commonwealth Edison Co., Chicago, Ill.

Harry Reid, National Electric Power Co., New York, N. Y.

James R. Strong, Tucker Electrical Construction Co., New York, N. Y.

(*Term expiring June 30th*, 1930)

D. C. Barnes, Stone & Webster, Inc., Boston, Mass.

H. P. Liversidge, The Philadelphia Electric Co., Philadelphia, Pa.

Gerard Swope, General Electric Co., New York, N. Y.

(*Term expiring June 30th*, 1931)

John P. Coghlan, Pacific Gas & Electric Co., San Francisco, Cal.

H. M. Edwards, The New York Edison Co., New York, N. Y.

E. M. Herr, Westinghouse Electric & Manufacturing Co., New York, N. Y.

National Section Chairmen

Accounting—John F. Ford, The Philadelphia Electric Co., Philadelphia, Pa.

Commercial—Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

Engineering—E. C. Stone, Duquesne Light Co., Pittsburgh, Pa.

Public Relations—J. F. Owens, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

Geographic Division Presidents

Canadian—P. S. Gregory, Shawinigan Water & Power Co., Montreal, Canada

Eastern—F. R. Phillips, Duquesne Light Co., Pittsburgh, Pa.

East Central—C. S. MacCalla, Pennsylvania-Ohio Power & Light Co., Youngstown, Ohio

Great Lakes—J. E. Johnson, Illinois Power & Light Corp., Chicago, Ill.

Middle West—Ralph T. Smalley, Kansas Electric Power Co., Lawrence, Kan.

New England—Irwin W. Day, The Connecticut Light & Power Co., Waterbury, Conn.

North Central—L. M. Pharis, Minnesota Power & Light Co., Duluth, Minn.

Northwest—R. M. Boykin, Puget Sound Power & Light Co., Seattle, Wash.

Pacific Coast—Paul M. Downing, Pacific Gas & Electric Co., San Francisco, Cal.

Rocky Mountain—Clare N. Stannard, Public Service Co. of Colorado, Denver, Colo.

Southeastern—C. A. Collier, Georgia Power Co., Atlanta, Ga.

Southwestern—J. G. Holtzclaw, Gulf States Utilities Co., Beaumont, Tex.

Public Policy Committee

Chairman, R. H. Ballard, Southern California Edison Co., Los Angeles, Cal.

Vice-Chairman, W. W. Freeman, Columbia Gas & Electric Corp., New York, N. Y.

P. S. Arkwright, Georgia Power Co., Atlanta, Ga.

Henry G. Bradlee, Stone & Webster, Inc., Boston, Mass.

N. F. Brady, The New York Edison Co., New York, N. Y.

B. C. Cobb, Allied Power & Light Corp., New York, N. Y.

Paul D. Cravath, Westinghouse Electric & Manufacturing Co., New York, N. Y.

Frank L. Dame, The North America Co., New York, N. Y.

J. E. Davidson, Nebraska Power Co., Omaha, Neb.

Henry L. Doherty, Henry L. Doherty & Co., New York, N. Y.

Alex Dow, The Detroit Edison Co., Detroit, Mich.

Charles L. Edgar, The Edison Electric Illuminating Co., Boston, Mass.

Halford Erickson, Byllesby Engineering & Management Corp., Chicago, Ill.

P. G. Gossler, Columbia Gas & Electric Corp., New York, N. Y.

A. R. Graustein, International Paper Co., New York, N. Y.

Franklin T. Griffith, Portland Electric Power Co., Portland, Ore.

C. E. Groesbeck, Electric Bond & Share Co., New York, N. Y.

Edwin Gruhl, The North American Co., New York, N. Y.

A. F. Hockenbeamer, Pacific Gas & Electric Co., San Francisco, Cal.

Martin J. Insull, Middle West Utilities Co., Chicago, Ill.

Samuel Insull, Commonwealth Edison Co., Chicago, Ill.

Walter H. Johnson, The Philadelphia Electric Co., Philadelphia, Pa.

W. A. Jones, Henry L. Doherty & Co., New York, N. Y.

John W. Lieb, The New York Edison Co., New York, N. Y.

Thomas W. Martin, Alabama Power Co., Birmingham, Ala.

Thomas N. McCarter, Public Service Electric & Gas Co., Newark, N. J.

John B. Miller, Southern California Edison Co., Los Angeles, Cal.

Sidney Z. Mitchell, Electric Bond & Share Co., New York, N. Y.

Thomas E. Murray, The New York Edison Co., New York, N. Y.

J. J. O'Brien, H. M. Byllesby & Co., Chicago, Ill.

J. F. Owens, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

R. F. Pack, Northern States Power Co., Minneapolis, Minn.

Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

H. T. Sands, Electric Bond & Share Co., New York, N. Y.

Paul A. Schoellkopf, The Niagara Falls Power Co., Niagara Falls, N. Y.

M. S. Sloan, The New York Edison Co., New York, N. Y.

Frank W. Smith, The United Electric Light & Power Co., New York, N. Y.

R. P. Stevens, Allied Power & Light Corp., New York, N. Y.

Frank M. Tait, The Dayton Power & Light Co., Dayton, Ohio.

A. W. Thompson, The United Gas Improvement Co., Philadelphia, Pa.

George N. Tidd, American Gas & Electric Co., New York, N. Y.

Herbert A. Wagner, Consolidated Gas, Electric Light & Power Co., Baltimore, Md.

Owen D. Young, General Electric Co., New York, N. Y.

Public Relations National Section Representatives

John F. Gilchrist, Commonwealth Edison Co., Chicago, Ill.

T. A. Kenney, Allied Power & Light Corp., New York, N. Y.

A. W. Robertson, Philadelphia Co., Pittsburgh, Pa.

Guy W. Talbot, Pacific Power & Light Co., Portland, Ore.

Geographic Divisions State Associations

CANADIAN DIVISION

(*Entire Dominion of Canada*)

Canadian Electrical Association

President, P. S. Gregory, The Shawinigan Water & Power Co., Montreal, Can.; *Secretary*, H. M. Lyster, Room 712, Power Bldg., Montreal, Can.

(*This Division Has No State [Provincial] Section*)

*EASTERN DIVISION

(*New Jersey, New York, Pennsylvania*)

President, F. R. Phillips, Duquesne Light Co., Pittsburgh, Pa.; *Managing Director*, A. B. Millar, Telegraph Bldg., Harrisburg, Pa.

Empire State Gas and Electric Association

President, Charles S. Ruffner, Mohawk-Hudson Power Corp., Albany, N. Y.; *Secretary*, Charles H. B. Chapin, 5618 Grand Central Terminal Bldg., New York, N. Y.

New Jersey Electric Association

President, C. H. Howell, Atlantic City Electric Co., Atlantic City, N. J.; *Secretary*, S. F. Delany, Atlantic City Electric Co., Atlantic City, N. J.

Pennsylvania Electric Association

President, F. R. Phillips, Duquesne Light Co., Pittsburgh, Pa.; *Managing Director*, A. B. Millar, Telegraph Bldg., Harrisburg, Pa.

EAST CENTRAL DIVISION

(*Kentucky, Ohio, West Virginia*)

President, C. S. MacCalla, Pennsylvania-Ohio Power & Light Co., Youngstown, Ohio; *Secretary-Treasurer*, D. L. Gaskill, 603½ Broadway, Greenville, Ohio.

Kentucky Association of Public Utilities

President, Samuel Riddle, Louisville Railway Co., Louisville, Ky.; *Secretary*, E. F. Kelly, Louisville Railway Co., Louisville, Ky.

Public Utilities Association of West Virginia

President, A. C. Spurr, Wheeling Traction Co., Wheeling, W. Va.; *Secretary*, A. Bliss McCrum, Box 1483, Charleston, W. Va.

GREAT LAKES DIVISION

(*Illinois, Indiana, Michigan, Wisconsin*)

President, J. E. Johnson, Illinois Power & Light Corp., Chicago, Ill.; *Secretary*, Tom C. Polk, 910 Marquette Bldg., Chicago, Ill.

Illinois State Electric Association

President, Julius L. Hecht, Public Service Co. of Northern Illinois, Chicago, Ill.; *Secretary-Treasurer*, Tom C. Polk, 910 Marquette Bldg., Chicago, Ill.

Indiana Electric Light Association

President, Norman A. Perry, Indianapolis Power & Light Co., Indianapolis, Ind.; *Secretary-Treasurer*, William Stokes, 1548 Consolidated Bldg., Indianapolis, Ind.

Michigan Electric Light Association Section

President, Howard Pett, Consumers Power Co., Jackson, Mich.; *Secretary-Treasurer*, Herbert Sylvester, The Detroit Edison Co., Ann Arbor, Mich.

Wisconsin Utilities Association

President, C. R. Phenicie, Wisconsin Public Service Corp., Green Bay, Wis.; *Executive Secretary*, John N. Cadby, Room 203, University Bldg., 432 Broadway, Milwaukee, Wis.

*MIDDLE ATLANTIC DIVISION

(*To Consist of Delaware, District of Columbia, Maryland, Virginia*)

Maryland Utilities Association

President, H. T. Connolly, Washington, Baltimore & Annapolis Electric Railroad Company, Baltimore, Md.; *Secretary*, D. E. Kinnear, United Railways & Electric Company, Baltimore, Md.

Public Utilities Association of Virginia

President, A. W. Higgins, Virginia Public Service Co., Charlottesville, Va.; *Secretary*, A. B. Tunis, 301 East Grace Street, Richmond, Va.

MIDDLE WEST DIVISION

(*Iowa, Kansas, Missouri, Nebraska*)

President, Ralph T. Smalley, Kansas Electric Power Co., Lawrence, Kan.; *Managing Director*, Thorne Browne, 1527 Sharp Bldg., Lincoln, Neb.

Iowa Section

President, C. S. Macy, Iowa Power & Light Co., Adel, Iowa; *Secretary-Treasurer*, H. E. Weeks, Tri-City Railway & Light Co., Davenport, Iowa.

Kansas Section

President, Frank M. Stone, Kansas Utilities Co., Fort Scott, Kan.; *Secretary*, H. Lee Jones, Kansas Gas & Electric Co., Wichita, Kan.

Missouri Association of Public Utilities

President, A. E. Reynolds, Springfield Gas & Electric Co., Springfield, Mo.; *Secretary-Treasurer*, F. D. Beardslee, 315 North Twelfth Street, St. Louis, Mo.

Nebraska Section

President, C. W. Amidon, Central Power Co., Grand Island, Neb.; *Managing Director*, Thorne Browne, 1527 Sharp Bldg., Lincoln, Neb.

NEW ENGLAND DIVISION

(*Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont*)

President, Irvin W. Day, The Connecticut Light & Power Co., Waterbury, Conn.; *Secretary*, Miss O. A. Bursiel, Room 1113 Statler Bldg., 20 Providence Street, Boston, Mass.

(*This Division Has No State Sections*)

NORTH CENTRAL DIVISION

(*Minnesota, North Dakota, South Dakota*)

North Central Electric Association

President, L. M. Pharis, Minnesota Power & Light Co., Duluth, Minn.; *Secretary*, John W. Lapham, 803-804 Plymouth Bldg., Minneapolis, Minn.

(*This Division Has No State Sections*)

NORTHWEST DIVISION

(*Alaska, Idaho, Montana, Oregon, Utah, Washington*)

Northwest Electric Light and Power Association

President, R. M. Boykin, Pudget Sound Power & Light Co., Seattle, Wash.; *Secretary*, Berkeley Snow, Room 1206, Spaulding Bldg., Portland, Ore.

(*This Division Has No State Sections*)

PACIFIC COAST DIVISION

(*Arizona, California, Hawaii, Nevada, Philippine Islands*)

Pacific Coast Electrical Association

President, Paul M. Downing, Pacific Gas & Electric Co., San Francisco, Cal.; *Secretary*, Samuel H. Taylor, Suite 729-730, 447 Sutter Street, San Francisco, Cal.

Arizona Utilities Association

President, M. A. Pooler, Tucson Gas, Electric Light & Power Co., Tucson, Ariz.; *Secretary*, L. C. McCullough, 134 South Central Avenue, Phoenix, Ariz.

ROCKY MOUNTAIN DIVISION

(*Colorado, New Mexico, Wyoming*)

President, Clare N. Stannard, Public Service Co. of Colorado, Denver, Colo.; *Secretary*, O. A. Weller, Public Service Co. of Colorado, Denver, Colo.

The Colorado Utilities Association

President, V. L. Board, Public Service Co. of Colo., Denver, Colo.; *Secretary*, O. A. Weller, Public Service Co. of Colo., Denver, Colo.

New Mexico Utilities Association

President, W. W. Nielsen, New Mexico Power Co., Santa Fe, N. M.; *Secretary-Treasurer*, Bernard L. Wiles, Albuquerque Gas & Electric Co., Albuquerque, N. M.

Wyoming Utilities Association

President, W. D. Johnstone, Mountain States Power Co., Casper, Wyo.; *Secretary*, F. A. Probst, Mountain States Telephone & Telegraph Co., Casper, Wyo.

SOUTHEASTERN DIVISION

(*Alabama, Cuba, Florida, Georgia, North Carolina, South Carolina, Tennessee, Porto Rico*)

President, C. A. Collier, Georgia Power Co., Atlanta, Ga.; *Secretary*, C. M. Kilian, 207-8 Bona Allen Bldg., Atlanta, Ga.

SOUTHWESTERN DIVISION

(*Arkansas, Louisiana, Mississippi, Oklahoma, Texas*)

President, J. G. Holtzclaw, Gulf States Utilities Co., Beaumont, Tex.; *Secretary*, S. J. Ballinger, San Antonio Public Service Co., San Antonio, Tex.

Arkansas Utilities Association

President, W. E. Bann, Southwestern Gas & Electric Co., Texarkana, Tex.; *Secretary*, R. I. Brown, Arkansas Central Power Co., Little Rock, Ark.

Mississippi Electric League

President, A. H. Jones, Jones-Johnson Co., McComb, Miss.; *Secretary*, A. R. Riddick, A. G. Riddick, Inc., Jackson, Miss.

Oklahoma Utilities Association

President, L. W. Scherer, United Telephone Corp., Watonga, Okla.; *Secretary*, Edward F. McKay, 1020 Petroleum Bldg., Oklahoma City, Okla.

Southwestern Public Service Association

President, W. H. Burke, Stone & Webster, Inc., Houston, Tex.; *Secretary*, E. N. Willis, 403 Slaughter Bldg., Dallas, Tex.

***Note: This Division is in Process of Formation.**

SECTIONS, BUREAUS and COMMITTEES

Chairmen's names only listed here

SPECIAL NATIONAL COMMITTEES

Advertising Committee—Frank Leroy Blanchard, Henry L. Doherty & Co., New York, N. Y.

Charles A. Coffin Prize Committee—P. S. Arkwright, Georgia Power Co., Atlanta, Ga.

Codes and Standards Committee—Irvin W. Day, The Connecticut Light & Power Co., Waterbury, Conn.

Constitution and By-Laws Committee—R. F. Pack, Northern States Power Co., Minneapolis, Minn.

Electrification of Steam Railroads Committee—Britton I. Budd, Public Service Co. of Northern Illinois, Chicago, Ill.

Exhibition Committee—E. W. Goldschmidt, Wagner Electric Corp., New York, N. Y.

Finance Committee—Sidney Z. Mitchell, Electric Bond & Share Co., New York, N. Y.

Lamp Committee—Frank W. Smith, The United Electric Light & Power Co., New York, N. Y.

Prize Awards Committee—W. H. Onken, Jr., *Electrical World*, New York, N. Y.

Public Policy Committee—R. H. Ballard, Southern California Edison Co., Los Angeles, Cal.

Rate Research Committee—L. R. Nash, Stone & Webster, Inc., Boston, Mass.

Water Power Development Committee—Paul A. Schoellkopf, The Niagara Falls Power Co., Niagara Falls, N. Y.

Wiring Policy Committee—J. E. Davidson, Nebraska Power Co., Omaha, Neb.

GENERAL NATIONAL COMMITTEES

***Civic Development Committee**—John B. Reynolds, Middle West Utilities Co., Chicago, Ill.

***Educational Committee**—Fred R. Jenkins, Commonwealth Edison Co., Chicago, Ill.

***Insurance Committee**—W. H. Sawyer, Allied Power & Light Co., New York, N. Y.

***Membership Committee**—Howard K. Mohr, The Philadelphia Electric Co., Philadelphia, Pa.

***Rural Electric Service Committee**—Charles F. Stuart, Northern States Power Co., Minneapolis, Minn.

ACCOUNTING NATIONAL SECTION

***Section's Executive Committee**—J. F. Ford, The Philadelphia Electric Co., Philadelphia, Pa.

***Classification of Accounts Committee**—H. C. Hasbrouck, H. C. Hopson & Co., New York, N. Y.

Corporate Finance Committee—O. E. McCormick, Middle West Utilities Co., Chicago, Ill.

***Customers' Records Committee** — Douglas Brown, New York & Queens Electric Light & Power Co., Long Island City, N. Y.

***Fixed Capital Committee**—J. A. Rockwood, Portland Electric Power Co., Portland, Ore.

***General Records Committee**—K. B. Crumb, American Gas & Electric Co., New York, N. Y.

***Purchasing and Storeroom Committee**—W. G. Young, New York & Queens Electric Light & Power Co., Long Island City, N. Y.

***Statistics Committee**—Harry A. Snow, The Detroit Edison Co., Detroit, Mich.

COMMERCIAL NATIONAL SECTION

Section's Executive Committee—Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

***Commercial and Industrial Power and Heating Bureau**—V. M. F. Tallman, Charles H. Tenney & Co., Boston, Mass.

Commercial Cooking Committee—O. Wilhelmy, The Union Gas & Electric Co., Cincinnati, Ohio.

Electric Truck Committee—Clyde Farnsworth, Public Service Co. of Colorado, Denver, Colo.

Central Power Committee—H. C. Thuerk, Erie Lighting Co., Erie, Pa.

Industrial Heating Committee—J. L. Faden, The Edison Electric Illuminating Co., Boston, Mass.

***Lighting Bureau**—T. O. Kennedy, The Ohio Public Service Co., Cleveland, Ohio.

Commercial and Industrial Lighting Committee—J. Daniels, The Edison Electric Illuminating Co., Boston, Mass.

Electrical Advertising Committee—C. J. Eaton, Middle West Utilities Co., Chicago, Ill.

Home Lighting Committee—W. T. Blackwell, Public Service Electric & Gas Co., Newark, N. J.

Street Lighting Committee—R. J. Malcomson, Public Service Co. of Northern Illinois, Chicago, Ill.

***Merchandising Bureau**—Frank D. Pembleton, Public Service Electric & Gas Co., Newark, N. J.

Domestic Electric Range Committee—F. A. Coupal, Buffalo, Niagara & Eastern Power Corp., Buffalo, N. Y.

Merchandise Sales Committee—C. L. Harold, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

Refrigeration Committee—C. L. Dunn, The Ohio Public Service Co., Cleveland, Ohio.

Water Heating Committee—Norman T. Wilcox, Stone & Webster, Inc., Boston, Mass.

***Customer Relations Committee**—H. T. East, Public Service Co. of Northern Illinois, Chicago, Ill.

Promotional Rates Committee—E. W. Lloyd, Commonwealth Edison Co., Chicago, Ill.

***Wiring Sales Committee**—A. P. Good, Commonwealth Edison Co., Chicago, Ill.

ENGINEERING NATIONAL SECTION

***Section's Executive Committee**—E. C. Stone, Duquesne Light Co., Pittsburgh, Pa.

***Accident Prevention Committee**—C. R. Beardsley, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

***Electrical Apparatus Committee**—J. A. Johnson, The Niagara Falls Power Co., Niagara Falls, N. Y.

Engineering Administration Committee—H. P. Liversidge, The Philadelphia Electric Co., Philadelphia, Pa.

***Hydraulic Power Committee**—Byron E. White, Utica Gas & Electric Co., Utica, N. Y.

***Inductive Coordination Committee**—H. L. Wills, Georgia Power Co., Atlanta, Ga.

***Meter Committee**—E. E. Hill, The New York Edison Co., New York, N. Y.

***Overhead Systems Committee**—Harold Cole, The Detroit Edison Co., Detroit, Mich.

***Power System Engineering Committee**—L. W. W. Morrow, *Electrical World*, New York, N. Y.

***Prime Movers Committee**—E. B. Ricketts, The New York Edison Co., New York, N. Y.

Special Engineering Research Committee—C. F. Hirshfeld, The Detroit Edison Co, Detroit, Mich.

***Underground Systems Committee**—J. W. Sylvester, The Philadelphia Electric Co., Philadelphia, Pa.

PUBLIC RELATIONS NATIONAL SECTION

***Section's Executive Committee**—J. F. OWENS, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

***Cooperation with Educational Institutions**—CARL D. JACKSON, 36 West 44th Street, New York, N. Y.

***Customer Ownership**—W. H. HODGE, Byllesby Engineering & Management Corp., Chicago, Ill.

***Industrial Relations Committee**—HOMER E. NIESZ, Commonwealth Edison Co., Chicago, Ill.

***Information Bureau Organizations Committee**—T. A. KENNEY, Allied Power & Light Corp., New York, N. Y.

Manufacturers' Advertising Committee—T. J. McMANIS, General Electric Co., Schenectady, N. Y.

***Public Speaking Committee**—W. S. VIVIAN, Middle West Utilities Co., Chicago, Ill.

***Relations with Financial Institutions Committee**—A. W. ROBERTSON, Philadelphia Co., Pittsburgh, Pa.

***Women's Committee**—MISS SOPHIA MALICKI, Middle West Utilities Co., Chicago, Ill.

***Provision is made for a representative from each Geographic Division.**

CONVENTIONS and MEETINGS

Meeting of the Section, Bureaus and Committees of the National Electric Light Association are shown in roman type; those of other associations in italics

1929

January

1–2 *American Association for the Advancement of Science, New York, N. Y.*

3 Corporate Finance Committee, 10.00 a. m., N. E. L. A. Headquarters, New York, N. Y.

7–9 *Midwinter Conference of Secretary Managers of Electrical Leagues, Cleveland, Ohio.*

9 *New York Electrical Society, New York, N. Y.*

10 Lighting Bureau, Commercial National Section, Hollenden Hotel, Cleveland, Ohio.

10–11 Electric Section, Empire State Gas and Electric Association, Engineering Societies Building, New York, N. Y.

14 *American Institute of Consulting Engineers, New York, N. Y.*

14–15 *American Engineering Council, Washington, D. C.*

14–18 *American Society of Steel Treating, Los Angeles, Cal.*

15–16 Kentucky Association of Public Utilities, Brown Hotel, Louisville, Ky.

15–18 *Society of Automotive Engineers, Detroit, Mich.*

18 *American Washing Machine Manufacturers Association, Drake Hotel, Chicago, Ill.*

21–26 *National Electrical Manufacturers Association, Supply Division, Hotel Commodore, New York, N. Y.*

21–22 Engineering Section, North Central Geographic Division, Minneapolis, Minn.

21–22 Overhead Systems Committee, William Penn Hotel, Pittsburgh, Pa.

24–25 Underground Systems Committee, William Penn Hotel, Pittsburgh, Pa.

25 Commercial Section, Great Lakes Geographic Division, Pfister Hotel, Milwaukee, Wis.

28–29 Rural Electric Service Conference, North Central Geographic Division, Nicollet Hotel, Minneapolis, Minn.

28–31 *American Institute of Electrical Engineers, New York, N. Y.*

February

1 *American Institute of Electrical Engineers, New York, N. Y.*

5–7 *Artictic Lighting Equipment Association, Cavalier Hotel, Virginia Beach, Va.*

6 *New York Electrical Society, New York, N. Y.*

6–8 *Iowa Engineering Society, Des Moines, Iowa.*

12–16 *Midwest Power Conference and Exhibition, Chicago, Ill.*

18–20 New Mexico Utilities Association, Franciscan Hotel, Albuquerque, N. M.

18–21 *American Institute of Mining and Metallurgical Engineers, New York, N. Y.*

20–27 *Own Your Home Exposition, Madison Square Garden, New York, N. Y.*

25–26 Accounting National Section, Group Committee meetings, Palmer House, Chicago, Ill.

25–26 Commercial Section, North Central Geographic Division, Nicollet Hotel, Minneapolis, Minn.

March

4–6 *American Railway Association, Division 4, Engineering Signal Section, Stevens Hotel, Chicago, Ill.*

6 *New York Electrical Society, New York, N. Y.*

8 *Board of Directors, Society for Electrical Development, New York, N. Y.*

11–14 Group Committee Meetings, Engineering National Section, Peabody Hotel, Memphis, Tenn.

12–14 Oklahoma Utilities Association, Oklahoma City, Okla.

20–22 *American Institute of Electrical Engineers, Regional Meeting, Cincinnati, Ohio.*

21–23 *American Society of Mechanical Engineers, Knoxville, Tenn.*

April

3 *New York Electrical Society, New York, N. Y.*

4–13 *Home Complete Exposition, Indiana State Fair Grounds, Indianapolis, Ind.*

17–18 *National Warm Air Heating and Ventilating Association, Indianapolis, Ind.*

21–23 *American Society of Civil Engineers, Dallas, Texas.*

22–26 *American Welding Society, Engineering Societies Bldg., New York, N. Y.*

24–26 Middle West Geographic Division, Hotel Fontenelle, Omaha, Neb.

29–30 *Chamber of Commerce of the U. S. A., Washington, D. C.*

30 Southwestern Geographic Division, Hot Springs, Ark.

30 Arkansas Utilities Association, Hot Springs, Ark.

May

1–3—Southwestern Geographic Division, Hot Springs, Ark.

1–3 Arkansas Utilities Association, Hot Springs, Ark.

1–3 *Chamber of Commerce of the U. S. A., Washington, D. C.*

7–9 *American Institute of Electrical Engineers, Regional Meeting, Dallas, Texas.*

7–10 East Central Geographic Division, Brown Hotel, Louisville, Ky.

8–10 Southeastern Geographic Division, Asheville, N. C.

13–15 *American Society of Mechanical Engineers, Rochester, N. Y.*

13–16 *National Fire Protection Association, Memphis, Tenn.*

27–31 *National Electrical Wholesalers Association, The Homestead, Hot Springs, Va.*

27–31 *General Federation of Women's Clubs, Swampscott, Mass.*

June

3–7 Annual Convention and Exhibition, NATIONAL ELECTRIC LIGHT ASSOCIATION, Municipal Auditorium, Atlantic City, N. J.

14 *Board of Directors, Society for Electrical Development, New York, N. Y.*

16–18 North Central Geographic Division, Breezy Point Summer Resort, Pequot, Minn.

18–21 *Society of Automotive Engineers, New York, N. Y.*

19–21 Canadian Geographic Division, Algonquin Hotel, St. Andrews-by-the-Sea, N. B.

19–22 Pacific Coast Geographic Division, Del Monte, Cal.

24–28 *American Society for Testing Material, Atlantic City, N. J.*

24–28 *American Institute of Electrical Engineers, Swampscott, Mass.*

July

1–4 *American Society of Mechanical Engineers, Salt Lake City, Utah*

August

27–30 *National Association of Railroad and Utilities Commissioners, Glacier National Park Hotel, Glacier National Park, Mont.*

September

4–6 Pennsylvania Electric Association, Bedford Springs Hotel, Bedford Springs, Pa.

9–11 Rocky Mountain Geographic Division (*Place not yet determined*)

October

14–18 *American Gas Association, Atlantic City, N. J.*

NEW MEMBERS

Electric Light & Power Companies (Class A)

- *Illinois, Chicago,* National Public Utilities Company
- *Indiana, Marengo,* General Utilities Company
- *Canada, Quebec,* Canton, Chambly, Chambly Power Corporation

Employees of Electric Light & Power Companies (Class B)

- *Alabama, Birmingham,* Birmingham Electric Company
    - C. R. Causey
- *California, Riverside,* The Southern Sierras Power Company
    - Edwin P. Pennebaker (El Centro)
- *California, San Francisco,* Great Western Power Company
    - F. W. McGuire
- *Massachusetts, Boston,* The Edison Electric Illuminating Co. of Boston
    - Dwight Bradford Hill
    - William F. Rooney
- *Massachusetts, Lowell,* The Lowell Electric Light Corporation
    - J. L. Scadding
- *Massachusetts, New Bedford,* New Bedford Gas & Edison Light Company
    - Mrs. Fannie M. Allen
- *Massachusetts, North Adams,* North Adams Gas Light Company
    - Fred A. Windover
- *New Jersey, Newark,* Public Service Electric & Gas Company
    - T. A. Eldridge (Metuchen, N. J.)
    - Howard E. Hebble (East Orange, N. J.)
    - Adolph Kuenzler (Metuchen, N. J.)
    - Ralph E. McLaughlin (Jersey City, N. J.)
    - William McNamara (Jersey City, N. J.)
    - Lewis Arthur Pifer (Irvington, N. J.)
    - Frederick J. Schaedler (Jersey City, N. J.)
    - Shabady Shaheen (Metuchen, N. J.)
    - F. H. Stillick (Metuchen, N. J.)
    - Frederick J. Trost (Belleville, N. J.)
    - F. Herbert Weldon (Jersey City, N. J.)
- *New York, Albany,* New York Power & Light Corporation
    - Chas. M. Hill
    - Herbert Lasher
- *New York, Mount Vernon,* Westchester Lighting Company
    - Robert E. Dean
    - L. D. Hatch (New York, N. Y.)
    - Irwin M. Huebsch
    - Francis J. O'Leary (Yonkers, N. Y.)
    - R. L. Petersen (Yonkers, N. Y.)
    - Emil A. Schryber (Mamaroneck, N. Y.)
- *New York, New York,* Bronx Gas & Electric Company
    - Otto H. Feulner
    - L. E. Fitzgibbon
    - Alfred E. O'Neill
- *New York, New York,* The New York Edison Company
    - George H. Arapakis
    - J. J. Formanek (Corona, Long Island, N. Y.)
    - Miss Emeline M. Kavin (Brooklyn, N. Y.)
    - Paul B. Smith (Brooklyn, N. Y.)
- *New York, New York,* The New York Edison Company
    - Jerome J. Walters
    - B. F. Wills (Brooklyn, N. Y.)
    - Walter E. Zeun
- *New York, New York.* The United Electric Light & Power Company
    - Lung C. Chin
    - Philip Josslon
    - Salvatore J. Scala
- *New York, Far Rockaway,* Queens Borough Gas & Electric Company
    - Henry F. Wagner
- *New York, Long Island City,* New York & Queens Electric Light & Power Co
    - Arthur E. Drake (Astoria, N. Y.)
    - Miss Elena H. Fogal (Jamaica, N. Y.)
    - Harold A. Nelson (Jamaica, N. Y.)
    - Miss Mae A. Waters (Woodside, N. Y.)
    - Miss Emily Willing (Woodside, N. Y.)
- *New York, Poughkeepsie,* Central Hudson Gas & Electric Corporation
    - E. E. Althouse
- *Ohio, Greenville,* Greenville Electric Light & Power Company
    - Harry L. Milligan

(*Continued on page 32*)

PARTIAL LIST OF N. E. L. A. COMMITTEE REPORTS

ENGINEERING NATIONAL SECTION

Prime Movers Committee—1927-1928

		Price	To Members
278-48	Specifications	.40	.25
278-49	Stokers and Furnaces	1.00	.65
278-53	Higher Steam Pressure and temperatures	.60	.40
278-65	Boilers, Superheaters and Economizers	1.00	.65
278-77	Foreign Developments	.40	.25
278-78	Condensing Equipment	.75	.50
278-80	Distillation Products of Coal	.40	.25
278-81	Treatment of Feed Water	.90	.60
278-84	Station Piping	.25	.15
278-85	Pulverized Fuel	1.50	1.00
278-101	Power Station Betterment	.60	.40

1926-1927

		Price	To Members
267-13	Stacks and Flues	.15	.10
267-17	Coal & Ash Handling	.25	.15
267-24	Oil and Gas Engines	.30	.20
267-42	Boiler and Turbine Room Instruments	.40	.25
267-78	Turbines	.90	.60

Overhead Systems Committee—1928-1929

		Price	To Members
289-6	Practical Uses of Steel and Concrete Poles	.40	.25

1927-1928

		Price	To Members
278-3	Service Tests of Treated and Untreated Poles	.15	.10
278-17	Mechanical and Electrical Properties of Conductors for 220-kv. Lines	.55	.35

Meter Committee—1928-1929

		Price	To Members
289-7	State Laws Relating to Theft of Electric Current	.40	.25

1927-1928

		Price	To Members
278-16	Standardization of Terminal Chambers for Single-Phase and Polyphase Watthour Meters	.15	.10
278-23	Auditing Meter Records	.15	.10
278-27	Educational Opportunities for the Meterman	.15	.10
278-31	Methods of Determining Correctness of Watthour Meter Connections	.90	.60
278-40	A Method for Determining the Condition of Current Transformers While in Service	.15	.10
278-43	Totalizing the Output of Two or More A. C. Circuits on One Watthour Meter	.30	.20
278-95	3-Phase, 4-Wire and 2-Phase, 5-Wire Metering	.25	.15

1926-1927

		Price	To Members
267-22	Supervision of Service Meter Testing and Verification of Tests	.15	.10
267-50	Changes in Watt-Hour Meter Terminal Chambers and Connections	.15	.10
267-53	Metering Three-Phase, Four-Wire, Secondary Network Systems (Under 600 Volts)	.15	.10
267-54	Metering Interchange of Power at High Voltages	.15	.10
267-92	Auxiliary Testing Apparatus	.45	.30

Underground Systems Committee—1927-1928

		Price	To Members
278-99	Cable Operation	.30	.20
278-102	Inspection and Testing of Cable	.25	.15
278-106	Conduit and Manhole Construction	.25	.15
278-107	Cable Joint Design and Construction	.40	.25

1926-1927

		Price	To Members
267-25	Suggested Specifications for Lead Covered Underground Cable Insulated with Impregnated Paper	.40	.25
267-32	Conduit and Manhole Temperatures	.40	.25
267-48	Cable Installation	.40	.25

Hydraulic Power Committee—1927-1928

		Price	To Members
278-34	Waterwheel Testing and Operating Records of Plant Discharge	.60	.40
278-76	Mechanical Reliability of Hydro-Electric Units—1926	.25	.15
278-104	Hydro-Electric Bibliography and Manufacturers' Statements	.30	.20

1926-1927

		Price	To Members
267-10	Methods of Increasing Head on Turbines by Means of Excess Flow	.40	.25
267-41	Governor Problems	.15	.10
267-44	Packing for Hydraulic Machines	.25	.15
267-76	Effect of Speed Regulation and Water Hammer on Design of Relief Valves, Penstocks and Surge Tanks	.45	.30

Accident Prevention Committee—1927-1928

		Price	To Members
278-4	Temporary Safety Grounding	.40	.25
278-44	Safe Practices for Construction and Operating Men	.75	.50

1926-1927

		Price	To Members
267-94	How to Set Up an Accident Prevention Organization	.25	.15

Electrical Apparatus Committee—1927-1928

		Price	To Members
278-6	Automatic and Remotely Controlled Substations	.55	.35
278-20	Generating Station Bus and Switch Structure Design	.90	.60
278-39	A. C. Substation Design Practice—1927	1.50	1.00

1926-1927

		Price	To Members
267-75	Guides for Specifications Covering Power Station Motor and Control Equipments	.25	.15

Inductive Coordination Committee—1927-1928

		Price	To Members
278-22	Harmonic Analyzer for Use on Power Circuits	.15	.10

1926-1927

		Price	To Members
267-21	Automatic Train Control	.25	.15
267-98	Radio Coordination	.45	.30

ACCOUNTING NATIONAL SECTION

Purchasing & Storeroom Committee—1927-1928

		Price	To Members
278-29	Standardization of Stationery and Office Supplies	.15	.10
278-30	Linking the Material and Supplies Account on the General Books with the Physical Inventories	.25	.15

General Records Committee—1927-1928

		Price	To Members
278-54	Economic Utilization of the Pay Roll Department	.15	.10

Customers Records Committee—1927-1928

		Price	To Members
278-32	Receiving, Recording and Refunding Line Extension Deposits	.40	.25

Fixed Capital Committee—1927-1928

		Price	To Members
278-60	Fixed Capital Records of Structures and Contract Construction	.30	.20

1926-1927

		Price	To Members
267-57	Practices in Work Order and Job Order Systems	.25	.15
267-58	Fixed Capital Records of Overhead and Underground Transmission and Distribution Systems	.30	.20

Corporate Finance Committee—1927-1928

		Price	To Members
278-72	Corporate Funds	.15	.10

Statistics Committee—1927-1928

		Price	To Members
278-62	N. E. L. A. Statistics	.15	.10

COMMERCIAL NATIONAL SECTION

Industrial Heating Committee—1927-1928

		Price	To Members
278-5	Carburizing in the Electric Furnace	.15	.10
278-13	Sales Plan for Developing Industrial Electric Heating Load for Electric Service Companies	.40	.25
278-28	Industrial Electric Heating Installations	.60	.40
278-93	Methods of Electric Welding	.15	.10

1926-1927

		Price	To Members
267-28	Vitreous Enameling in the Electric Furnace	.15	.10
267-29	Application of Electric Heat in Hardening and Tempering Steel	.25	.15
267-69	Index to Articles on Industrial Electric Heating	.15	.10

Lighting Service Committee—1928-1929

		Price	To Members
289-5	Lighting Service Manual—Part III	.40	.25

1927-1928

		Price	To Members
278-1	Lighting Service Manual, Part II	.60	.40

1926-1927

		Price	To Members
267-1	Lighting Service Manual—Part I	.55	.35

Power Committee—1927-1928

		Price	To Members
278-18	Economic Utilization of Waste-Wood	.15	.10
278-61	Serial Report	.30	.20

1926-1927

		Price	To Members
267-97	Diesel Oil Engine Power Costs	.40	.25

General Merchandising Committee—1927-1928

		Price	To Members
278-9	Trade Practice in Central Station Merchandising	.15	.10

Industrial Lighting Committee—1927-1928

		Price	To Members
278-19	Results of the Industrial Lighting Sales Campaigns	.30	.20

Wiring Committee—1927-1928

		Price	To Members
278-35	Sell Additional Wiring	.15	.10

SPECIAL NATIONAL COMMITTEES

Electrification of Steam Railroads Committee—1927-1928

		Price	To Members
278-103	Serial Report	.55	.35

Rate Research Committee—1927-1928

		Price	To Members
278-105	Electric Light and Power Rates in U. S.	.75	.50

GENERAL NATIONAL COMMITTEES

Insurance Committee—1927-1928

		Price	To Members
278-97	Fire Insurance for Gas and Electric Utilities	.25	.15

A more complete list may be secured on application

Quantity Discounts on Committee Reports

10-24 copies	5%	250-499 copies	20%
25-99 copies	10%	500-999 copies	25%
100-249 copies	15%	1000 and over	30%

Quantity discounts apply only to one order in one shipment to one address and are not cumulative. Half prices to colleges and public libraries upon direct order to the Association. Discount of 15 per cent from non-member prices allowed to dealers.

Organizations should send orders on their purchase forms. Please give publication number, when shown.

NATIONAL ELECTRIC LIGHT ASSOCIATION

420 Lexington Ave., New York, N. Y.

INFORMATIONAL LITERATURE

(Prices do not include transportation.)

289-14—The Electric Light and Power Industry in the United States. Paper binding, 1 to 25 copies, $1.00 each; 26 to 100 copies, 90c. each; 101 to 500 copies, 85c. each; 501 or more, 75c. each.

289-3 —N.E.L.A. Handbook. Compiled by Public Speaking Committee. $2.50 per copy.

Reprint of Official Report of Proceedings Before the Federal Trade Commission in the Matter of Investigation of Public Utility Corporations Under Senate Resolution Number 83:

278-56—Vol. I (Hearings March 8; April 11, 12 and 13, 1928). 75c. per copy.

278-69—Vol. II (Hearings April 24, 25, 26 and 27; May 2, 3 and 4; May 9, 10 and 11, 1928). $1.25 per copy.

278-90—Vol. III (Hearings May 15, 16 and 17; May 28, 29, 31; June 1 and 2; June 12, 13 and 14, 1928). $1.50 per copy

289-4—Vol. IV (Hearings June 15; June 20, 21 and 22; June 26, 27, 28, 29 and 30; July 2, 3 and 6, 1928). $1.75 per copy.

The Romance of Power. By C. M. Ripley. Slides (104 in a set, including carrying case)—$35 per set. Speakers' Pamphlets—75c. per copy. (278-2) Pamphlet for general distribution—10c. per copy—100 or more, $17.50 per 100. (278-8).

278-41—The Proposed Investigation of the Electrical Industry and the Boulder Dam Situation. By M. S. Sloan. $3.00 per 100.

Electricity—How It Is Made and How Distributed. 1928 School Pamphlet. $17.50 per 1000 copies. (This price includes imprinting of company name on the cover. No order for less than 1000 copies will be accepted under this offer.)

278-47—Electric Light and Power—Facts and Figures on the Development and Scope of the Industry in the United States (Statistical Section of the N. E. L. A. Handbook). $15.00 per 100.

278-51—The National Electric Light Association—Its Purpose and Its Functions. By H. T. Sands. $7.50 per 100.

278-94—The National Electric Light Association During the Administrative Year 1927-1928. By H. T. Sands. $4.00 per 100.

The Issues of 1928 as Seen By a Business Man. By Merle Thorpe. $3.50 per 100.

Address of President Coolidge Before the Society of the Daughters of the American Revolution, Washington, D. C. April 16, 1928. $2.50 per 100.

Public vs. Private Ownership and Operation of Water Power Resources. By Hugh L. Cooper. $7.50 per 100.

278-71—Report of the Public Policy Committee. R. H. Ballard, Chairman.

278-82—An Official Statement by the National Electric Light Association in Convention Assembled.

278-68—That the Public May Know Us As We Know Ourselves To Be. By J. F. Owens. $3.50 per 100.

278-70—The Producer's Part in the Development of Power. By J. F. Owens. $3.75 per 100.

278-83—The Investment Company in Business Development. By John T. Madden. $12.50 per 100.

278-86—Labor's Part in Electrical Development. By Hugh Frayne. $3.00 per 100.

278-87—Some Economic and Public Aspects of the Electric Industry as Viewed by a Layman. Melvin A. Traylor. $3.50 per 100.

278-88—Industry and the Professional Schools of Business. By Deane W. Malott. $3.00 per 100.

278-89—Thunder and Lighting. By Clayton Rand. $3.00 per 100.

278-91—Electricity and the Farmer. By Clifford V. Gregory. $3.50 per 100.

278-92—Government in Industry. By John E. Edgerton. $3.00 per 100.

289-1 —From Bottom Up or Top Down. By Merle Thorpe. $3.00 per 100.

The Relation of Utilities to Governmental Bodies. By Ralph E. Heilman. 10c. each.

Valuation of Public Utilities. By Ralph E. Heilman. 10c. each.

Public Utility Securities. By Ralph E. Heilman. 10c. each.

Organization and Financing of Public Utilities. By Ralph E. Heilman. 10c. each.

WOMEN'S COMMITTEE PUBLICATIONS

278-26—Light and Power for the Homemaker. By Mrs. Anna Steese Richardson. $4.00 per 100.

The Home Service Department. No charge.

More Power to the Home! Series.

1. **Wiring the House**—1-9..10c. each; 10 and over 9c. each.
2. **Light—the First Home Builder; Better Lighting**—1-9..15c. each; 10 and over 14c. each.
3. **Washing** ....—1-9..10c. each; 10 and over 9c. each.
4. **Ironing** ....—1-9..12c. each; 10 and over 11c. each.
5. **Many Motors Make Light Work**—1-9 15c. each; 10 and over 14c. each.
6. **Electric Range Cookery**—1-9..15c. each; 10 and over 14c. each.

OTHER PUBLICATIONS

(Prices include transportation in United States only.)

ACCIDENT PREVENTION—RESUSCITATION

First Aid and Resuscitation in Gas Poisoning, Electric Shock and Drowning. Booklet 3¼x6 inches. 20 pages. 5 illustrations. (Publication No. 278-57)

1-9	copies, to one address, each	.10
10-99	copies, to one address, each	.08
100-499	copies, to one address, each	.06
500-999	copies, to one address, each	.04
1000-2499	copies, to one address, each	.03
2500-9999	copies, per M	$20.00
10,000-24,999	copies, per M	19.00
25,000-49,999	copies, per M	18.00
50,000-93,999	copies, per M	17.00
100,000 and	over, per M	16.00

Accident Prevention Course for Linemen.

	Price	To Members
1-24 copies	.25	.16
25 copies to one address, each	.22	.15
100 copies to one address, each	.21	.14
250 copies to one address, each	.20	.13
500 copies to one address, each	.19	.12

ENGINEERING REFERENCE WORKS

Handbook for Electrical Metermen, 1924. Fourth Edition. Publication No. 24-31. 4½ by 6¾ inches. 1242 pages. Bible paper.

	Price	To Members
1-9 copies	$6.00	$4.00
10 copies to one address, each	5.65	3.75
25 copies to one address, each	5.25	3.50
50 copies to one address, each	4.90	3.25
100 copies to one address, each	4.50	3.00

Relay Handbook, 1926. Publication No. 25-3. 4½ x 6¾ inches. 1024 pages. Bible paper.

	Price	To Members
1-9 copies	$6.00	$4.00
10 copies to one address, each	5.65	3.75
25 copies to one address, each	5.25	3.50
50 copies to one address, each	4.90	3.25
100 copies to one address, each	4.50	3.00

Member prices to A.I.E.E. members, and students.

Overhead Systems Reference Book, 1927. Publication No. 267-5. 8½ x 11¼ inches. 592 pages.

	Price	To Members
1-9 copies	$7.50	$5.00
10 copies to one address, each	7.25	4.75
25 copies to one address, each	7.00	4.50
50 copies to one address, each	6.75	4.25
100 copies to one address, each	6.50	4.00

Code for Electricity Meters. 3rd Edition. Publication No. 267-70. 6x9 inches, 132 pages,

1-9 copies	$2.00
10 copies to one address, each	1.90
25 copies to one address, each	1.80
50 copies to one address, each	1.70

PERIODICALS

Rate Research. A weekly digest of court opinions and commission decisions affecting the central station industry. Per year, $10. Foreign, $11.

N.E.L.A. Bulletin. $3 per Year; $4 Foreign.

PROCEEDINGS

	Price	To Members
N.E.L.A. Proceedings, 1927-1928	$15.00	$10.00

Reduced prices for quantities apply only to one order in one shipment to one address and are not cumulative.

Quantity prices, where not stated, furnished on request. Half prices to colleges and public libraries upon direct order to the Association. Discount of 15 per cent from non-member prices allowed to dealers. Organizations should send orders on their purchase forms. Please give publication number, when shown.

NATIONAL ELECTRIC LIGHT ASSOCIATION

420 Lexington Ave., New York, N. Y.

THE PRESIDENT'S PAGE

FROM the standpoint of material things, as well as that of morale, no year has ever been better for the electrical industry than the one just passed.

While, during the year, it has borne the brunt of the assault of those who would nationalize the country's industries, businesses and professions, it is worth emphasizing that: utility securities have a preferred place in the market—what better test of the public's confidence; the great majority of reputable newspapers, journals and individual leaders of thought who believe in fair play, have protested against the unfair and often scurrilous attacks made upon the industry; we have a firm conviction that we are successfully doing our job—furnishing service to our customers at fair rates, and safeguarding the interests of the millions of people, banks, trusts, insurance companies that have invested in our securities; we feel that we are doing our part in helping to make this country the finest in the world.

During 1928 the production of electricity by all agencies which contribute to the public supply, according to preliminary estimates, was approximately 88,000,000,000 kilowatt-hours, in addition to which another 1,600,000,000 kilowatt-hours was imported from Canada. This total available supply was as much as the production of all the rest of the world. During the past seven years, the industry has added more than 13,500,000 kilowatts to generating capacity; it has constructed nearly 50,000 miles of high voltage transmission lines; doubled the output of its energy and increased the number of its customers by more than 10,000,000.

Approximately 1,400,000 new customers were added during 1928, making a total of 23,000,000 now served by this industry. Of these, nearly 19,000,000 are household users, indicating the rapid increase in the diffusion of electric service to the homes of the nation. Twenty-five years ago, the total number of all consumers was 650,000. Electric service has now been extended to every city with a population of 5,000 and over; to 97% of all communities with populations between 1,000 and 5,000; to 50% of all communities between 250 and 1000; and to more than 25% of all hamlets of less than 250 population.

There is satisfaction in viewing our 1928 accomplishments, and we look forward to 1929 with confidence.

P S Arkwright

President.

Information relating to the N. E. L. A. BULLETIN will be found on inside page of front cover.

In Its 21st Year

"A NEW departure of the National Electric Light Association in the issue of this BULLETIN is undertaken in the hope of accomplishing several objects simultaneously. . . .

"With the columns of this little publication open to committees, or to individual members having matters of interest to the membership at large, there should be ample opportunity for the dissemination of useful information among members." *From Vol. I, No.* 1, *N. E. L. A.* BULLETIN, *August,* 1907.

* * * *

"Our readers cannot fail to note that this month the BULLETIN comes out in a new dress. We hope and believe it will be regarded as a handsomer dress. Change is sometimes worth while, as change, for its own sake—'For God fulfills himself in many ways, Lest one good custom should corrupt the world.' In the present instance, the BULLETIN which has always been of an odd size, from the printing standpoint, is brought in line with the conventional magazine sizes of the day. As already stated . . . it is proposed to throw more emphasis on the BULLETIN as a part of association work, and to increase its usefulness. Beginning a few years ago as a very modest little fly-sheet, it is even now a magazine of respectable proportions, and each year proves itself to be more and more helpful as an Association agency for information and education." *From Vol. VI, No.* 1, *N. E. L. A.* BULLETIN, *September,* 1912.

"The change in . . . form and contents of the old BULLETIN is another departure from the old way of things. We do not feel that in its old form it was playing a big and active enough part in the life of the Association. The contents perhaps were a little too dry . . . We intend to lighten things up a bit and put "pep" into the magazine.

"The BULLETIN in the past has been adequately representative of the physical material, and mechanical life of the association, but it has not been quite so able in expressing what we might call the N. E. L. A. spirit. This is a spirit of good fellowship, enthusiasm and progress. This is the spirit we are going to make the magazine radiate from every page. Starting with this number, we are going to make the old BULLETIN a new BULLETIN, alive, progressive, and more representative of our great Association. We need your cooperation." *From Vol. VII (new series), No.* 1, *N. E. L. A.* BULLETIN, *January,* 1920.

* * * *

Old readers will perceive that the N. E. L. A. BULLETIN again comes out in new format. It is hoped that it will be liked. Its policy will remain — *"To advance the art and science of the production, distribution and use of electrical energy for public service."*

A Leap Before Looking

THE decision of the Interstate Commerce Commission to refrain from compelling railroads to make further installations of automatic train control devices or block signals, as announced on Nov. 28, is of interest to everyone. After three years the commission has apparently decided that the results obtained are too small in comparison with the investment required. This is an example of the manner in which a Federal Government Bureau may plunge an industry into an expenditure of tens of millions of dollars without having made sufficient inquiry into the question as to whether this expenditure will bring commensurate results.

On June 30, 1920, the commission ordered forty-nine railroads to install automatic train control by Jan. 1, 1925. On Jan. 14, 1924, it issued a second order adding forty-five railroads to this list. In reply to a petition for rehearing, the commission said: "The fifteen years of investigation and study and the results obtained in the actual influence of these devices over a period of years upon some of the railroads, have clearly demonstrated the practicability of, and the necessity for automatic train stop or train control. The time has now arrived when the carriers should be required to select and install such devices as will meet our specifications and requirements."

Since that time the safety devices called for by these orders have been installed on 11,238 miles of road with 19,752 miles of traffic and 8361 locomotives, at a cost of approximately 26½ million dollars, according to a statement issued by the National Association of Railroad and Utilities Commissioners dated, Nov. 30, 1928. Now the commission decides that: "The number of accidents and casualties which resulted from disregard of signal indications, is relatively small in comparison with those which resulted from other causes."

For this reason it has concluded: "not to require by order at the present time further installations of train stop or train control devices." It takes occasion at this time, to admonish the railroads to be: "diligent in their efforts to provide adequate protection against accidents due to grade crossings, derailments, collisions in territory not protected by block signals, failure of wooden bridges, and trestles and the use of wooden passenger train cars which have been repeatedly mentioned in our recommendations to Congress."

Apparently the commission is discouraged over the net results of the installation of automatic train control devices, for it says: "There is no evidence of the actual prevention of accidents by the intervention of the automatic device and in the nature of things, little affirmative evidence can be expected."

This matter is of interest to industry, because some of the early devices were susceptible to interference from light and power systems and from electrically operated machinery in factories adjacent to railroad rights of way, and often resulted in occasional faulty signal indications. A considerable amount of trouble and expense has devolved upon the National Electric Light Association and individual power companies in connection with a study of the subject, which, through cooperation with the railroads, has resulted from time to time in the adoption of other systems which are immune to foreign current interferences.

The significance of the situation, is that such large expenditures for no purpose, ultimately must be reflected in the cost of service to the consumer.

The Spirit of Shakespeare in Physical Research

By OWEN D. YOUNG

ON June 1, 1889, I received my first diploma. It was granted by the Board of Regents of the University of the State of New York. It certified that I was to be accepted by the world as an academic graduate. Last night I received from you the honorary degree of Doctor of Laws, a much rarer but not more highly prized distinction. The first came when I was fourteen years old—the last at fifty-four. What honor, however great, can compete with the joy of taking home your first diploma? Now I thank you for them both. They mark a span of forty years, and together they constitute my most prized possession.

Much has happened during that forty years. In a sense we have moved from an old world to a new, not only in the things we have, but in the way we think and the kind of things we talk about.

In 1889, at the time of my first diploma, I was thrilled by an oration, great of its time and kind. In the peroration, the speaker told us how on one quiet moonlight night he had taken a canoe and gone out on one of the great bays of Lake Superior beyond the sight of land. There was no movement of the air or water, nothing but the arch of the sky above and its reflection below—a perfect sphere at the center of which was an individual man alone.

In a recent lecture before the British Association at Oxford, Dr. Arthur S. Eddington, professor of Astronomy at the University of Cambridge, said:

The Chairman of the Board of the General Electric Company, Co-author of the Dawes Plan, and Citizen Extraordinary of the United States, needs no introduction to the readers of the N. E. L. A. BULLETIN. *This address was given at the 64th Convocation of the University of the State of New York on Oct. 19th, when Mr. Young was awarded the honorary degree of Doctor of Laws. It is believed that, aside from other considerations, it is of particular timeliness because of the great interest being manifested in pure science research, which has resulted in the creation of the National Research Fund to which the electrical industry, through the National Electric Light Association, has subscribed.*

"Nearly midway in scale between the atom and the star there is another structure no less marvelous — the human body. Man is slightly nearer to the atom than to the star. About 10^{27} atoms build his body; about 10^{28} human bodies constitute enough material to build a star.

"From his central position man can survey the grandest works of Nature with the astronomer, or the minutest works with the physicist. Tonight I ask you to look both ways. For the road to a knowledge of the stars leads through the atom; and important knowledge of the atom has been reached through the stars."

In both cases the individual man is at the center of the sphere, but how different the spirit of approach. I believe it characteristic of the two periods.

Ten raised to the twenty-seventh power measuring the number of atoms in the human body is just as much an appeal to the imagination as the perfect sphere on Lake Superior. But it is something more too, and it is that something which is suggested by the term research today. It reflects the intellectual bent of our time. It combines the imagination of William Shakespeare with the flair for knowledge of Francis Bacon. And so, Mr. President, with your permission, I should like to draw attention to two periods which have much in common, and which, to my mind, are the most productive of any in our history. They are three hundred years apart, the one from 1575 to 1650, and the other from 1875 to 1950; the latter, fortunately, with twenty-two years yet to go.

There seem to be periods when the imagination of men flowers in production. It appears to be stimulated by a demand for new things. Curiously enough, it has a relation to business and to profits. It matters not whether one speaks of Sir Walter Raleigh or Sir Francis Drake or William Shakespeare or Thomas A. Edison. The imagination is harnessed to a very prosaic need, and that, to my mind, is the distinctive characteristics of the periods of which I speak. Perhaps it is not so far away from the subject assigned to me, which is the contribution of research to industry. My point is that the human intellect functions best when it is hitched more or less closely to practical service, and conversely very ordinary jobs, such as navigation and the production of goods, take on a new aspect when there is cast over them the glow of the highest qualities of the humand mind. The intellectual activity of the schoolmen in the middle ages was an interesting pastime, but it could scarcely have brought a greater thrill or more satisfaction than the solution of a crossword puzzle does to day. So, too, the navigation of a slave ship was a very different thing from that of the little fleet which carried Columbus westward or Sir Francis Drake on his momentous voyage, or Commander Byrd on his present adventure. The combination of the imaginative qualities of the human intellect with the matter of fact production of goods or performance of service is an inspiration to both. This combination existed in the time of Elizabeth, just as it does today. It may account in some measure for the great things which happened then, just as I believe it accounts for the things which happen now. Let us take a look at the conditions of the two periods and see how much they have in common.

Action Everywhere

Since 1875 our population has almost doubled, urban growth has trebled, and the wealth and prosperity of the people have enormously increased. New industries have sprung up, science and invention have provided new things and afforded new ways of spending unexpected wealth. The quiet of a generation ago has been succeeded by great restlessness. Everywhere there is activity both in mind and body. Young men and women have flocked into our schools and colleges. They have called up in critical review, not only the fashions and customs of their fathers and mothers, but their very habits of thought. They refuse the old strait-jacket, and we call them unconventional and daring. Good—they reflect the spirit of the age. Everywhere there is action, and not only action but speed. We race over our roads—we fly through the air—we talk across continents—we throw the energy of Niagara hundreds of miles to the points where we need it, and all these activities require daring and skill and nervous tension. It is life, not in repose, but in action.

Changes in Elizabethan Times

So it was in the time of Elizabeth. Great companies were organized to reach world markets. The Armada was swept from the seas, Spanish influence in the western hemisphere was curbed, and England became a world power. Its population doubled and that of London trebled in a brief period. Young men were lured from the farms to the cities. Wealth increased rapidly, and with it the independence of the merchant classes. In the words of a contemporary observer: "This sort of people — commonlie live wealthilie, keepe good houses and travell to get riches—with grasing frequenting of markets and keeping of servants they do come to great welth, in so much that manie of them are able and doo buie the lands of unthriftie gentlemen, and often setting their sonnes to the schools, the universities, and to the Inns of the Court."

New things were demanded and provided. Chimneys were invented, and tobacco, potatoes and forks came into common use.

Riding in coaches became such a pastime as to threaten the business of the boatmen on the Thames. Luxury and extravagance reached such a height that a sumptuary proclamation referred to the "immeasurable charges and expenses" which certain classes "of better sorte" were put to "in superfluous apparelling their wives, children and families, the confusion also of degrees in all places being great, where the meanest are as richly apparelled as their betters, and the pride that such inferiour persons take in their garments, drawing many for their maintenance to robbing and stealing by the hiewaye."

The monasteries were closed and the authority of the church weakened. Preachers complained bitterly of the decay of morality, and learning at the universities reached a low ebb. By what grace, they inquired, just as we are inquiring today, would the generation be saved?

We can look back and see the answer.

"Merrie" England Awakened

This "merrie England" had awakened from a long sleep and found itself in a new world. The explorers and adventurers had discovered new continents and strange people in the far off seas. There was wealth untold for him that would journey there. Men were in a receptive and appreciative state of mind, their curiosity was aroused, their intellects were hungry. Everywhere were imagination and action.

Printing had been invented. Few could read, but everyone could understand, and so in the theatres and from the musical tongues of actors they could hear about the old English kings, about gods and goddesses, about Julius Caesar and Cleopatra, about the merchants of Venice, and about the strange things in far off lands. Never before had there been in England so much to talk about.

What wonder then that professional talkers and writers sprang up everywhere as numerous as berries on a bush. It was not necessary to import foreign talent to establish the commercial means to meet this demand and the theatre and dramatic industry, as it was indigenous, also became one of the most flourishing, comparable to the movie industry today in the number of theatres and crowds in attendance.

What an opportunity for money making, and the illiterate pawn broker Henslow, supplied with the necessary technical knowledge by the marriage of his daughter to the actor Alleyn, establishes a play factory where experts in plot-making and acting, specialists in tragical discourse, puns and merry jokes are in demand. His plant turns out on an average one play every two weeks, and he manages to keep his actors in subservience and his poets in constant need by the simple expedient of lending them money and never allowing their debts to be fully paid off. Go to Henslow's if you want a job at writing or acting, an old wig, a costume or a play; and if the play is merely an old one that has been pilfered, rewritten and renamed, that is your lookout. In any event, Henslow is growing rich and London is being amused.

But there is a young fellow come up

from Stratford who will bear watching. He is only holding horses now for Heming and the Burbages at the Globe, or perhaps he is an apprentice, but he is a likeable chap, clever, and sees everything, and by the time that seven years have elapsed your staff may be complaining that this Johannes factotum, this young upstart, plumed with their feathers, claims that he is able to bombast out a line as well as the best of them. They have booted his company with its "baggage books" out of the Oxford grounds, but he thinks he can show the University fellows a trick or two. Besides, they say he is ambitious and thrifty and has set his cap on making a fortune, getting a coat of arms for his family and rubbing elbows with the nobilty.

The first thing we know he will be going back to Stratford, buying the biggest place in town and with a twinkle in his eye letting the town fathers see that he wasn't such a good for nothing after all, and had in fact done better than anyone else what everybody said he couldn't do at all.

Shakespeare's day came, and taking into account the other great movements of the period, it may seem not a little strange that now it is for him and others like him that the Tudor reigns are chiefly remembered. Today Elizabethan literature quite overshadows our interest in the commercial expansion, the religious controversies, the political intrigue, of the period.

Contemporary Estimate Different

Yet the contemporary estimate was far different. Writing for the theatres was not practicing the art of letters. Dramatic composition in Latin and Greek for performance at the University was noble and worth while, but plays written in the vernacular and for the amusement of the rabble, were tainted with commercialism and of no permanent value. From the standpoint of the universities and "cultured" classes, the dramatists were only artisans and tradesmen, fashioning and vending their wares in accordance with public demand. "God forbid," exclaims Daniel, "I should my paper blot with mercenary lines. No, no, my verse respects not Thames nor theatres."

But Shakespeare and his contemporaries were supplying their active age with the things it wanted, and the universities might frown on the commercial playwrights. The devotees to old customs might lament the new ways, but in spite of all, the greatest imaginative intellects of the race were functioning in response to real demand.

Shakespeare had drawn revenue as co-proprietor of the Globe, as actor, and as poet to the extent of $3,000 a year, and then returned to his mansion at Stratford with a comfortable estate of some $50,000. He had been associated with men in the same business who had grown rich in catering to the public taste. Pope may have been far from jesting when he declared that Shakespeare

"For gain, not glory, winged his roving flight,
And grew immortal in his own despite."

The criticism sounds strangely familiar to modern ears.

Perhaps Charles Darwin was the Chaucer of our time. It may be that Faraday and Joseph Henry had their counterparts in the earlier day in another field. But broadly speaking, it is true that with occasional exceptions the human mind had lain fallow in the field of practical achievement until 1875, just as it had in the field of language and literature before 1575. And then what a burst of glory. * * * —the intellect of man blossoms again and makes amazing contributions to human welfare.

Just as the voyages of Vasco Da Gama and Columbus and Magellan, by disclosing a new world, played havoc with traditional beliefs, created a demand for an explanation and an interpretation and produced the great poets of the Elizabethan period, so the discoveries of Dalton and Prout and Crookes and Roentgen during the second half of the nineteenth century disclosed another and even more marvellous universe within the atom, for an explanation of which we look to the physical scientist of today.

The glories of the sun, the moon and the stars, the wonders of nature, have always been a theme for poets and philosophers. Since the days of Democritus and Lucretius the granular structure of matter had been discussed, and speculation even reached the point where all matter was conceived of as compounded of the hydrogen atom. But thought had gone no further when many of us received our diplomas and were sent out into the world to show the benighted what education could do for a man.

Soon, however, from continued experiments on electrical discharges in rarified gases and especially from a close study of the so-called cathode rays, scientists were led to recognize the existence of the electrons, small negatively charged particles of which all matter was composed, each 2000 times as small as this same hydrogen atom.

There are about two billion inhabitants on the globe. If every man, woman and child had five hundred billion dollars and each dollar represented an atom, their total wealth would still fall short of the number of atoms found in a drop of water. It contains so many that if the entire earth, both land and sea, were covered with a velvet lawn, and each blade of grass represented ten thousand atoms, the little elf of science could collect them all in a basket the size of a raindrop.

Is this imagination? To the physical scientist not at all. These things have been weighed and counted. Radium, x-rays and radio bear witness to their reality. But what *is* this atom; what are these electrons, parts of itself that it shoots forth at the speed of light? Here we are definitely in the field of speculation and fancy, and hardly a year passes that does not see the entrance as well as the exit of a Thompson, a Rutheford, a Langmuir, a Bohr, or a Shroedinger form of atom. The electrons are in concentric spheres about a central proton, they stand still, they move at the rate of one hundred thousand miles a second, they travel in orbits, they are like planets moving about a central sun, they are but a vibrating mass of ether. The space relative to their size for their accommodation within the atom, itself infinitesimally small, is no less ample than the solar system itself.

From Small to Great

In his attempt to unify physical nature, the physicist turns from the infinitely small to the incomprehensibly great. Like the true poet that he is, he lets his eye glance

"from heaven to earth, from earth to heaven;
And, as imagination bodies forth
The forms of things unknown, the poet's pen
Turns them to shapes, and gives to airy nothing
A local habitation and a name" . . .

Light travels at the rate of 186,000 miles a second, and the distance that it travels in a year is some five thousand billion miles. Using this light year as his yard stick, the astrophysicist finds the nearest star twenty thousand million miles away; finds that the largest would accommodate the entire orbit of the earth with millions of miles beyond Neptune to spare; finds the smallest about the size of the earth, with matter weighing about a ton per cubic inch.

These blazing orbs with temperature of forty million degrees are the furnaces in which he sets his crucibles. They number four billion, yet are so far apart that they are in no more danger of colliding than thirty baseballs roaming the whole interior of the earth. Their characteristics "depend on the simplest and most fundamental laws of nature, and even with our present knowledge might have been predicted from general physical principles if we had never seen a star." "So detailed an interpretation of the properties of the greatest bodies known in nature, directly from the properties of the smallest, constitutes," as has been truly said, "one of the most notable triumphs of modern physical science," and, I may add, of the human imagination.

What Lies Ahead?

Only a few of the paths to truth have yet been traversed, and who can predict what the future may have in store. For observe that with all our investigations and inquiries we are not creating anything. We are only finding out what already exists—facts of which mankind must take account if it is to survive.

Does nature wait until she is found out before she exacts her penalties or bestows her blessings? Not at all. In the reign of the Tudors about a quarter to a sixth of the population of London was wiped out every generation and in a single season by epidemics and disease, and in Shakespeare's day the death rate determined whether the theatres should be opened or closed. Today, thanks to research, such plagues are almost unknown. For millions of years the sun has delivered her life giving rays at the rate of 4,690,000 horse power per square mile, worth at current rates upward of two billion dollars a year. Now physical research has disclosed yet other rays coming from space with a wave length one hundred millionth that of light and five thousandths that of X-rays, the shortest heretofore known. What effect these may be producing on us as we gather here, or on the material substance in the walls of this edifice itself is at present unknown. They may be keeping us alive, they may be destroying us or what they do may be entirely within our control. Future physical research will find out. A microscopic speck of yeast under proper conditions will produce 75 tons of edible food in ten days. What blessings may not the electron and the cosmic rays some day confer on a perishing race when their incredible hidden energy is tapped and brought under control.

Human progress may be compared to an ascending spiral, and the course of civilization may be divided into successive periods of activity and apparent rest, each of which is destined to make its special contribution to the total sum. Now it is to art, now to religion, now to the science of Government, now to literature, now to philosophy, now to physical science, now to industry that we point in evaluating these epochs, for these are the things of the spirit and the intellect that do not perish though heaven and earth pass away.

When Shakespeare was born, our English literature was represented by Chaucer with his Canterbury Tales, and the struggling efforts of Langland with his Piers Plowman and John Gower with his Confessio Amantis, together with some pastorals and interludes and a few early plays like Gammer Gurton's Needle, and Ferrox and Pollux. Save Chaucer they were not important in themselves. The next fifty years not only made a language but a literature. It brought into being works, the like of which have not been equalled since. It seems as if all the imagination and resources of the race which had been growing roots for many generations suddenly blossomed into Shakespeare, and Ben Jonson, and Marlowe, and John Milton. This, of course, is naming only a few, because men of real first-rate capacity sprang up everywhere. In its freshness and verve and spirit, no other period, certainly in our literary history, has approached that stretch of two generations beginning with Edmund Spenser and Sir Philip Sidney, reaching its height in William Shakespeare and ending with the lofty refrains of John Milton.

Coming to the later period, perhaps Charles Darwin was the Chaucer of our time. It may be that Faraday and Joseph Henry had their counterparts in the earlier day in another field. But broadly speaking, it is true that with occasional exceptions the human mind had lain fallow in the field of practical achievement until 1875, just as it had in the field of language and literature before 1575. And then what a burst of glory. Graham Bell comes with the telephone, Edison with the electric lamp and a system to work it. Power, whether developed by steam or water, once stationary, is now mobile. The motor car replaces the horse, the flying machine conquers the air, and radio waves, knowing no physical barrier, become carriers of the valuable intangibles of life to all people everywhere. So the intellect of man blossoms again and makes amazing contributions to human welfare.

The Poet of Today

In the words of Bagehot, Shakespeare's works could only have been produced by a first rate imagination working on a first rate experience. But, he added, "to a great experience one thing is essential—an experiencing nature." In other words, receptivity and appreciation of the things in the midst of which we live. There is more than a coincidence in the fact that the generation following Columbus produced a Copernicus and a Luther, and the next a Galileo and a Shakespeare. Emerson said: "The poet is the man who sees and handles that which others dream of, traverses the whole scale of experience, and is representative of man, in virtue of being the largest power to receive and impart." He is "a heart in unison with his time and country."

And so, Mr. President, I salute the workers in physical research as the poets of today. It may be that they do not write in verse, but their communications are of such lively interest that they are on the fornt pages of our newspapers and command space in our cultural periodicals. They appeal to the imagination of us all. They contribute the warming glow of inspiration to industry, and when industry pulls their ideas down from the heavens to the earth and harnesses them for practical service, it, too, feels that it is an important actor, not only in the making of things, but on the larger stage of the human spirit. There may be enough poetry in the whir of our machines so that our machine age will become immortal.

The Relation of *Science* to INDUSTRY

By ROBERT ANDREWS MILLIKAN

A WELL known public speaker of fifty years ago once remarked ruefully after disastrous consequences had followed misplaced humor, "I rose by my gravity and fell by my levity."

I use this incident as an introduction to my speech on Science and Industry for the sake of calling attention to the fact that what is absurd or ridiculous today was perfectly good science, or at least good philosophy, not more than 350 years ago—that the very existence of the "laws of gravity" was discovered as late as 1650 A. D. and that "levity" and "levitation" have through all recorded history up to Newton been just as acceptable scientific ideas as gravity and gravitation—so recently have we begun to understand just a little about the nature of the world in which we live.

Nor do I need to go back 300 years to make my point as to the newness of our knowledge. It is within the memory of every man of sixty that in the great Empire State of New York the question could be seriously debated, and in the most intelligent of her communities, too, as to whether Archbishop Usher's chronology computed by adding Adam's 930 years to Enoch's 365 years to Methuselah's 960 years, etc., gave the correct date of creation.

Importance of Correct Understanding

But what has this to do with "Science and Industry"? Everything! For mankind's fundamental beliefs about the nature of the world and his place in it are in the last analysis the great moving forces behind all his activities. Hence the enormous practical importance of correct understandings. It is his beliefs about the nature of his world that determine whether man in Africa spends his time and his energies in beating tomtoms to drive away the evil spirits, or in Phoenicia in building a great "burning fiery furnace" to Moloch into which to throw his children as sacrifices to his God, or in Attica in making war on his fellow Greeks because the Delphic Oracle, or the flight of birds, or the appearance of an animal's entrails bids him to do so, or in medieval Europe in preparing for the millenium to the neglect of all his normal activities and duties as he did to the extent of bringing on a world disaster in the year 1000, or whether he spent his energies in burning heretics in Flanders or drowning witches in Salem, or in making perpetual motion machines in Philadelphia or magnetic belts in Los Angeles, or soothing syrups in New England.

Dr. Millikan, in addition to being one of the world's preeminent scientists, is an extremely articulate one and has been foremost in bringing to the public a realization of civilization's debt to, and dependence upon, research in pure science.

Dr. Millikan is Director of the Norman Bridge Research Laboratory in Physics at Pasadena. He is a member of leading scientific societies, and has been the recipient of many honors in the scientific world. He was Edison Medalist (A. I. E. E.) for 1923, Hughes Medalist (Royal Society of Great Britain) for 1923 and winner of the Nobel Prize in physics in 1923.

This address was delivered recently over the radio from Station WGY Schenectady, as a part of the "Woman's Home Companion" Hour.

One-tenth as Useful

The invention of the airplane and the radio are looked upon by everyone as wonderful and pre-eminently useful achievements, and so they are—perhaps one-tenth as useful as some of the discoveries in pure science about which I wish to speak.

This new achievement of the race, this new capacity for education was after all only an inevitable incident in the forward sweep of pure science. which means simply knowledge, knowledge of the nature and capacities of the physical world, of the ethereal world (to which the radio belongs), of the biological world and the intellectual world; for this knowledge, as man acquires it, necessarily carries applied science in its wake.

What Made Airplane Possible

Look for a moment at the historic background out of which these modern marvels, as you call them, the airplane and the radio, have sprung. Neither of them would have been at all possible without 200 years of work in pure science before any bread and butter applications were dreamed of—work beginning in the sixteenth century with Copernicus and Kepler and Galileo, whose discoveries for the first time began to cause mankind to glimpse a nature, or a God, whichever term you prefer, not of caprice and whim as had been all the Gods of the ancient world, but instead a God who rules through law, a nature which can be counted upon and hence is worth knowing and worth carefully studying. This discovery which began to be made about 1600 A. D., I call the supreme discovery of all the ages, for before any application was ever dreamed of, it began to change the whole philosophical and religious outlook of the race, it began to effect a spiritual and an intellectual, not a material revolution—the material revolution came later. This new knowledge was what began at that time to banish the monastic ideal which had led thousands, perhaps millions, of men, to withdraw themselves from useful lives. It was this new knowledge that began to inspire man to know his universe so as to be able to live in it more rationally.

As a result of that inspiration there followed 200 years of the pure science involved in the development of the mathematics and the celestial mechanics necessary merely to understand the movements of the heavenly bodies—

useless knowledge to the unthinking, but all constituting an indispensable foundation for the development of the terrestrial mechanics and the industrial civilization which actually followed in the nineteenth century; for the very laws of force and motion essential to the design of all power machines of every sort were completely unknown to the ancient world, completely unknown up to Galileo's time.

Do you practical men fully realize that the airplane was only made possible by the development of the internal combustion engine, and that this in its turn was only made possible by the development of the laws governing all heat engines, the laws of thermo-dynamics, through the use for the hundred preceding years of the steam engine, and that this was only made possible by the preceding 200 years of work in celestial mechanics, that this was only made possible by the discovery by Galileo and by Newton of the laws of force and motion which have to be utilized in every one of the subsequent developments. That states the relationship of pure science to industry. The one is the child of the other. You may apply any blood test you wish and you will at once establish the relationship. Pure science begat modern industry.

In the case of the radio art, the commercial values of which now mount up to the billions of dollars, the parentage is still easier to trace. For if one's vision does not enable him to look back 300 years, even the shortest-sighted of men can scarcely fail to see back as much as eighteen years. For the whole structure of the radio art has been built since 1910 definitely and unquestionably upon researches carried on in the pure science laboratories for 20 years before anyone dreamed that there were immediate commercial applications of these electronic discharges in high vacuum.

The Same Story Everywhere

It is precisely the same story everywhere in all branches of human progress. I suspect it would be difficult to find one single exception. Here is the latest illustration that came to my attention recently in a letter from the Air Reduction Sales Company. It reads as follows: "We take pleasure in handing you herewith a complete set of luminescent tubes, each containing in the pure state one of the elements of the air, namely, nitrogen, oxygen, argon, hydrogen, neon, helium, krypton and xenon. It seems to us worthy of note that at the beginning of this century these gaseous elements as such had practically no commercial value or significance. Today the estimated value of the plants and equipment that have been created either to manufacture or to use and handle these gases in industry amounts to three hundred million dollars."

The writer of this letter might have added that the chain of discovery which led up to this result started in the most "useless" of all sciences, astronomy; for helium, as its name implies and as everybody knows was first discovered in the sun with the aid of the spectroscope, and thirty years later it was its discovery in minute amounts in our atmosphere, also with the aid of the spectroscope, that set us looking for the other inert gases of which the letter speaks and which have recently found such enormous application in neon tubes and the like.

But why continue this recital, for no intelligent man today needs to be convinced that our material prosperity rests wholly upon the development of our science. It is as to the broader values, intellectual and spiritual, that even intelligent men sometimes express doubt. Let me then start with the foundations that I have already laid and try to show to what these beginnings are leading, whither we are going, not materially, but as feeling, thinking and willing beings.

The Soul of Prosperity

Was Pasteur only a scientific enthusiast when he wrote "In our century science is the soul of the prosperity of nations and the living source of all progress. Undoubtedly the tiring discussions of politics seem to be our guide—empty appearances! What really leads us forward is a few scientific discoveries and their application."

Or was H. G. Wells, himself not a scientist at all, merely talking nonsense when he wrote quite recently (and note that he is not talking about a material thing either):

> "When the intellectual history of this time comes to be written, nothing, I think, will stand out more strikingly than the empty gulf in quality between the superb and richly fruitful scientific investigations that are going on, and the general thought of other educated sections of the community. I do not mean that scientific men are, as a whole, a class of supermen, dealing and thinking about everything in a way altogether better than the common run of humanity, but in their field they think and work with an intensity, integrity, breadth, a boldness, patience, thoroughness, fruitfulness, excepting only a few artists, which puts their work out of all comparison with any other human activity. In these particular directions the human mind has achieved a new and higher quality of attitude and gesture, a veracity, a self-detachment, and self-abrogating vigor of criticism that tends to spread out and must ultimately spread to every other human affair."

Man Looks Around

We have learned within the past half dozen years through studies in radio activity that this world of ours has in all probability been a going concern, in something like its present geological aspects as to crustal constituents, temperatures, etc., for more than a billion years, and hence that the human race can probably count on occupying it for a very long time to come, say another billion years; and further, that mankind has been doing business on it in something like his present shape for something like 20,000 years, or possibly 50,000, but in any case a time that is negligibly small in comparison with the time that is behind and the time that is presumably ahead of him—in other words, we have learned that mankind, speaking of him as an individual human being, is now just an infant a few months old at the most, an infant that up to about one minute ago, for the 300 years since Galileo is but a minute in the geological time-scale, has been lying in his crib spending his waking hours playing with his fingers, wiggling his toes, shaking his rattle, in a word, in simply becoming conscious of his own sensations and his functions, waking up, as he did amazingly in Greece, to his own mental and emotional insides. Just one minute ago he began for the first time to peer out through the slats in his crib, to wonder and to begin to try to find out what kind of an external world it is that lies around him, what kind of a world it is in which he has got to live for the next billion years. The answers to that question, even though never completely given, are henceforth his one supreme concern.

In this minute of experience that he has already had he has tumbled down in his crib, bumped his head against the slats, and seen stars—real ones and unreal ones, and he hasn't yet learned to distinguish with certainty between those that actually exist and those that only seem to exist because his eye-balls have been subjected to the pressure that comes from a blow, and so he is reaching out his hands part of the time trying to grasp illusions, and yet slowly, painfully learning, bit by bit, that there is an external world physical and biological, that can be known, that can be counted upon, when it has once become known, to act consistently, not capriciously, that there is a law of gravity and that it isn't necessary to be covered with bruises all the time because he forgets that it exists, that there is a principle of conservation of energy, and that all constructive and worth while effort everywhere must henceforth take it into account and be consonant with it, that it is not worth while to spend much time hereafter with sentimentalists who wish that that law did not exist and sometimes try to legislate it out of existence, that again there are facts of heredity that it is utterly futile to inveigh against, that our whole duty is rather to bend every energy to know what they are and then to find how to best live in conformity with them, that in a single sentence there is the possibility ahead of mankind of learning, in the next billion years of its existence, to live at least a million times more wisely than we now live. This is what Pasteur meant when he said "What really leads us forward is a few scientific discoveries and their applications." This is what Wells meant when he contrasted the result of the objective method of learning used in the pursuit of science with what he calls "the general thought of other educated sections of the community." The one guesses and acts upon its hunches or its prejudices, the other tries at least to know, and succeeds in knowing part of the time.

We Need Science in Education

We need science in education and much more of it than we now have, not primarily to train technicians for the industries which demand them, though that may be important, but much more to give everybody a little glimpse of the scientific mode of approach to life's problems, to give everyone some familiarity with at least one field in which the distinction between correct and incorrect or right or wrong is not always blurred and uncertain, to let him see that it is not true that "one opinion is as good as another," to let everyone understand that up to Galileo's time it was reputable science to talk about gravity and levity, but that after Galileo's time the use of levity became limited to the ridiculous, that "the town that voted the earth was flat, flat as my hat, flatter than that," had a perfect right to exist before 1400 A. D. but not after that date, that we are learning slowly through the accumulated experience and experimenting of the centuries, especially since 1600 A. D., more about the eternal laws that do govern in the world in which we live. And for my own part I do not believe for a moment that these eternal laws are limited to the physical world either. Less than sixty years ago, to take one single illustration, there existed a relatively large political party in the United States called the Greenback Party which jumped at conclusions and which conducted campaigns to induce our government to go over to a fiat money basis. I do not suppose such a party could exist today unless it be in states that pass anti-evolution laws, for there are some laws that have become established, even in the field of finance.

Knowledge Makes Us What We Are

This brings me to a brief discussion of the current opposition to the advance of science—an opposition participated in even by some intelligent people, on the ground that mankind cannot be trusted with too much knowledge, by others on the ground that beauty and art and high emotion are incompatible with science. Now, fear of knowledge is as old as the Garden of Eden and as recent as Dr. Faust, and there is no new answer to be made to it. The old answer is merely to point to what the increase in knowledge has done to the lot of mankind in the past, and I think that answer is sufficient, for it has certainly enfranchised the slave, and given every man, even the poorest, such opportunities as not even the prince of old enjoyed. Who would go back to the stone age because stone age man had no explosives? Of course, every new capacity for beauty and joy brings with it the possibility of misuse and hence a new capacity for sorrow. But it is our knowledge alone that makes us men instead of lizards, and thank God, we cannot go back whether we would or no. Our supreme, our God-like task, is to create greater beauty and fuller joy with every increased power rather than to turn our weeping eyes toward the past and fling ourselves madly, unreasoningly athwart the path of progress.

No, the only real question in a nation like ours is not whether science is good for us materially, intellectually, esthetically, artistically. Of course it is, for science is simply knowledge and all knowledge helps. The only real question is how the forward march of pure science, and of applied science which necessarily follows upon the heels, can best be maintained and stimulated for, as Pasteur said, "It is this alone that really leads us forward."

Whose Job to Support Science?

The answer to that question will depend upon the nature of one's whole social philosophy. If you think that social progress is best brought about by a paternalistic regime of some kind, by throwing upon a few elected or hereditary officials the whole responsibility for social initiative of all sorts, then you will say, "Let the government do it all; let it establish state universities and state research laboratories and state experimental projects of all kinds as it has done in most European countries and let the whole responsibility for our scientific progress lie in these institutions." But if you believe with the early makers of our nation in the widest possible distribution of social responsibility, in the wide-spread stimulation of constructive effort, in the nearest possible approach to equality of opportunity, not only for rising to wealth and position, but for sharing in community service, if you believe with the President-Elect that government should only step in where private enterprise fails, that it should act only as a stimulant to private initiative and a check to private greed then your industries which are themselves the offspring of pure science, will join in the great nation-wide movement to keep alive the spirit of science all over this land of ours through keeping pure science going strong in the universities, its logical home, and applied science going strong in the private industrial laboratories where it thrives best. No country ever had such an opportunity as ours, no country ever had such a widespread stimulation of individual initiative, such a large number of citizens who had learned to treat financial power as a public trust, such resources to command, such results to anticipate With our American ideals American industry cannot fail, I think, to realize this opportunity, and to support and keep in the finest possible condition, "the hen that lays her golden egg."

N. E. L. A. PUBLICATIONS

A list of current N. E. L. A. publications appears on pages 4 and 5 of this issue of The Bulletin. A more complete list may be obtained on application to the Sales and Order Department, National Electric Light Association, 420 Lexington Avenue, New York, N. Y.

A Great Utility's Obligations to Investor and Public

—*As Seen by Its President*

By M. S. SLOAN

IT has been my good fortune to be able to participate in the work of associations of our industry, state and national, both as member and officer for many years. No one who has not so participated can realize the value of such work. It affords opportunity for growth and professional development of the individuals engaged in it and by the interchange of information, discussion of new ideas and the acquaintanceships formed through meetings furthers cooperation among the companies and advances their standards of operation.

Our electrical industry has been singularly fortunate in that respect. Owing to the fact that our companies are public utilities serving each in its franchise territory and for many years under public regulation we have not had the business rivalries and jealousies to handicap us in the development of strong and efficient trade organizations which many businesses have encountered. There have been no manufacturing processes and trade secrets to safeguard from aggressive competitors. The discoveries, methods, practices found by any one of our member companies to be advantageous have been freely disclosed to all others to be adopted and applied in their judgment for their benefit and the benefit of their customers. I think this fact, as much as any one thing, has been responsible for the remarkable advance of our industry in its methods and in its standards of service.

Misguided Criticism

Recently we have heard a great deal of critical comment on the thoroughness with which our national organization has been organized, the scope of the work it has undertaken and the amount of money spent in carrying on such work. These elements have even been set forth as evidence of the existence of an electrical trust. Such criticism seems to me to be miguided and misinformed. The union of electrical companies into strong trade organizations has certainly not resulted in restriction of service at the disposal of the public. It certainly has not resulted in increased prices, either by restriction of service or by agreement to force customers to pay more money for what they buy. Quite the contrary. It has increased the general fund of knowledge, permitted the adoption of higher standards of service and by discussion and example has tended to bring about the lowering of prices wherever conditions permit. These, surely, are not the results usually attributed to a trust or any appurtenance of a trust.

The head of The New York Edison Company, Brooklyn Edison Company, Inc., The United Electric Light and Power Company, New York and Queens Electric Light and Power Company and The Yonkers Electric Light and Power Company does more than give his conception of the rights, duties and obligations of a public service company. Without realizing it, perhaps, he lays down the philosophy which has guided him in all his activities. Mr. Sloan is first vice-president of the N. E. L. A.

This address was delivered before the annual meeting of the Metropolitan New York Section, N. E. L. A., held at the Waldorf-Astoria Hotel Dec. 14.

In recent years our industry has been undergoing in marked degree a change in the setup of its units—a combining of companies into larger companies and systems, similar to conditions witnessed in many other lines of business. This also has been pointed to as evidence of an electrical trust, gradually tightening its tentacles on the defenseless public, its customers. Like the other evidence of existence of this alleged trust, this seems to me to be misguided and misinformed. The entire trend of business in our nation is toward larger units, toward combinations to reduce expenses, to improve commodities or service supplied to the public, and to reduce prices as and when possible. In our industry it has been a natural evolution, a mark of progress in our work, an inevitable development for the better carrying out of our task. It has resulted in notable improvements in the service supplied to large areas of our country and its results in price reduction have been evident. They have been favorably commented on by the Public Service Commission of this State and have not passed unnoticed by regulatory bodies elsewhere.

The companies serving this city are large organizations, but like others they are subject to the conditions which have dictated such combinations. Those conditions have operated, and if I may I'd like now to address myself to the situation thus produced.

The Situation in New York

We are engaged in one of the most important and interesting developments in connection with furnishing electrical service in this territory of any which have occurred since the very beginning of the central station industry with the opening of the Pearl Street plant. Here is a group of major electrical companies serving a very large part of New York City, united in management as well as ownership and other companies associated through common ownership, which take in a considerable territory outside of New York City proper. The whole group is being created into a system unified in ownership, control. operation and management. Taken as a unit, it is the largest electrical utility in the world—the largest in investment, in number of customers, in service facilities and in amount of service sold. It is the largest also in opportunity for service to the public.

The advantages of this consolidation are obvious to us who are engaged in this business. They are not so obvious perhaps to the general public, and yet the proceedings before the Public Service Commission, as a result of which the consolidation was authorized, made it apparent that they were appreciated at least in general outline. Chief among these advantages is the fact that this consolidation brings interconnection into effect in day to day operation instead of as an emergency measure or something to be used only under special conditions. Operation as a system wipes out company lines in the dispatching of power. It means the obtaining of maximum efficiency and economy in the use of all the plants in the system in handling the load. Operation as a system means the possibility of applying technical improvements, advances in the art, at once and on a large scale instead of piecemeal, company by company. It means the most complete and efficient employment of capital already invested in plants and equipment, and it reduces the requirements for new capital investment to care for future growth in the territory served by the system. When new financing becomes necessary it means that money can be hired on the most advantageous terms; even more advantageous than had been possible in the past although the companies as individual entities were large enough and sound enough financially to command good credit and good terms in acquiring new capital. It means economies in purchasing and in administration. It means the possibility of unified policies of operation, of merchandising, of customer relations and of relations with the general public.

Maximum of Efficiency and Economy

In short, the consolidation of these companies into a system represents the maximum possibility of efficiency and economy in all departments and phases of public utility operation. It presents the maximum opportunity for supplying the highest grade service to the public, and, by reason of the economies achieved, of selling that service to the public at the lowest possible price.

We are under mandate as a part of the conditions on which we are permitted to make this consolidation to share the benefits obtained from it with the public. This we intend to do, not alone because we are expected by the State regulating authorities to do it but first and foremost because it is our duty as public servants to do it. Public service corporations occupy a relationship toward the public which is different from that of any other business organization. The law says they are "affected with a public interest." Any consideration of the relationship of utilities to the public, therefore, must begin with that fact and never get away from it. Our companies have certain privileges for the use of rights or property of the public which other businesses do not enjoy. The companies pay for these privileges in various forms of taxation and this use of public property is permitted in order to enable the companies to furnish a service which is essential to modern living, reaching all the people with it as they could not be reached without such use of public streets and highways.

A Heavy Obligation

Nevertheless, these privileges are granted to us by the public. Without them we could not do business and our business produces profits, as that term is ordinarily understood, for those who have invested in it. Moreover, we have exclusive right to furnish electrical service to the public in our franchise territory. This is granted to us by public authorities and is for the benefit of the people because a public utility is recognized as what the economists call a natural monopoly. Still we do have this monopoly privilege and it is for our business advantage. What I am saying gets down to the fact that the public does more for us in thus enabling us to carry on our business under present conditions than it does for any other class of business. It has thus placed us under a heavy obligation.

In consideration of the privileges it grants to us the public regulates us as to standards of service, as to rates and as to capitalization, but because it does more for us than for others it expects more from us, and I hold that it has a right to expect more from us. The law obligates us to furnish safe and adequate service at fair and reasonable rates and the Public Service Commission is empowered to check us up and see that we comply with the law. Mere compliance with the law's provisions would not be enough for us, serving the public we do in this greatest city in the world. We have to do more than that. We have to go beyond the letter of the law's requirements and consider and live up to the spirit of those requirements. It was to enable us to do just that—to comply with the spirit of the law in the highest and fullest measure—that this consolidation of companies into an electrical system serving the Metropolitan district was brought about. We are trustees for the interests of the public as well as trustees for the investors in these properties. We can do our duty to both with success only as we fulfill our obligations to the public in the most complete measure.

What We Owe to the Public

Let us stop and consider a moment what we, as a public service organization, owe to the public. First, we owe, obviously, a technical service which shall be just as good as we know how to make it; as safe and as unfailing as the very best brains of the technicians can produce. We owe a service ample to supply every demand that can be made on it at any moment of day or night. That means that our plants and distribution facilities must be built well ahead of the demands as we calculate them from year to year, and they must be kept up to date, equipped with the most modern generating machinery and operated according to the highest standards of the electrical art.

We owe a service which is broadly human and helpful to our customers. This means that all of our people, all of us engaged in serving the public, must be alert, intelligent, well trained in our duties, courteous in all contacts with the public and possessed of a desire to do everything we can to make our service useful to the customers in every way.

We owe a management which is honest and square dealing, which is efficient and economical in its handling of the companies' affairs, which is sensitive to public opinion, particularly to the public's needs and desires and willing and anxious to meet them. We owe a management which is broad-visioned so that it can plan for the future while operating satisfactorily in the present. We owe a public policy which takes cognizance of all of these matters and earnestly and sincerely endeavors to translate them into facts which are a part of the daily routine of operation. We owe a public policy which recognizes that the public and the public utility are in effect partners, and which therefore shares without hesitation and without quibbling the benefits derived from efficient and economical operation between the investors in the utility and the customers of the utility.

In Position to Live Up to Obligation

Briefly stated, those are the obligations of the public utility to the people as I see them, and this consolidation of companies was brought about so that we may be in better position than ever before to live up to those obligations.

Now what does this require of us as individuals, and all of the others among the 30,000 employees of this system? As I see it, it requires an absolute and complete realization that this job of ours is a job of public service. That means that we must furnish 100 per cent devotion to the public interest. To do this we must put 100 per cent effort into our jobs and give 100 per cent loyalty to our organization. I regard it as elementary that the public utility is no place for hangers-on, or time-servers, for office politicians and others of that ilk, for people with outside business interests or aspirations and ambitions which will divide their loyalty, interest and effort between these outside interests and their jobs.

Neither as a business concern nor as an agency of public service can a public utility tolerate anything less than the best.

When it can be done, these companies in the system will be consolidated into one company as the final process in unifying operations and simplifying the situation in respect of service. This company will be the largest electrical utility in the world. It is my ambition to see it the very best also—leader and example as to quality of service and enlightened and liberal policies in its relationship to the public.

An Outstanding Institution

There is no reason why a public service company should not be so well operated, should not furnish such high grade service and be so well known and understood by the people it serves that they will be proud of it as an outstanding local institution. I hope to see our utility occupy that position; to see it known and recognized as an honest, trustworthy, valuable public servant and respected and esteemed on those grounds.

Now that is a task for all of us to work out. It's a goal, if you please, for all of us to endeavor to reach. It isn't something to be brought about by me alone or by you alone. Teamwork is needed to accomplish the task; organization effort by every person from top to bottom in the organization. The meter reader, the repairman, have their part in this effort just as much as the president, and it may well be that their part is somewhat more critical because in the course of the day's work they meet and have contact with many more customers than the president does.

Let Us Catch the Vision

Let us try to catch the vision of this situation we must work toward. Here are a million homes dependent on us for electrical service to make life easier, better, happier. Here is a great industrial community and we've got to supply the power to keep its thousands of machines moving. Here is the greatest commercial, trading, and financial center in the world with its vast hotels, stores, theaters, public buildings of every nature using our service and dependent on it. Here are six million people going about their daily affairs, their lives woven together into the complex pattern produced by modern civilization in a metropolis. This city could not function without our service. Its affairs would be disrupted, hurled into chaos, if some inconceivable event should put our plants and equipment out of business. That is the measure of our importance in the scheme of things. And so whatever we do to better our service, to improve our operation, to make electricity more useful and more widely available, is of direct and measurable benefit to those people and the community.

A Responsibility! An Opportunity!

What a responsibility rests on us! What an opportunity for service is ours! I don't mind saying I consider this job of ours—mind you, I say ours because it is a job for all of us in this system which has been created—the biggest and most engrossing the entire public utility field offers. It's the biggest and most potential in all its possibilities. It will require everything we've got of brains and energy and character and good citizenship and public spirit. But we've got those qualities. It is up to us to put them into our work day in and day out, year in and year out.

There could by no possibility be a higher demand on us; but we can meet it and I know we will. The degree to which we do meet it will be the measure of our fitness for our work. We don't dare fall short.

SHORT SERMONS

It is not enough that a few Big Business leaders shall understand what is going on. It is necessary that the mass of employers and employees shall catch the spirit of the times in order that they may prepare themselves for .. .. .. the New Economic Order and the new attitude toward business which must follow if American prosperity is to lead not only to a better living but to a larger life for all. —*Forbes Magazine.*

* * * *

There is no need to exaggerate what electricity can do. To date it has never been called upon to perform any duty that it has not proven itself equal to. The truth about household uses of electricity is as interesting and absorbing a story as one could wish and it is just as unnecessary and foolish to make fantastic statements about it as it would be to point to a rose or a gladiola.
—*Electrical News*, Toronto.

* * * *

If there has been one distinct injury to young people in the flaming youth period, it has been inflicted by the abatement of hero-worship. Admiration for a proficient elder in one's chosen art, craft, or profession, and a desire to win his approbation, have always provided young people with their most powerful impetus toward achievement. These have been out of fashion, and one may see the result in many a bright lad, who, too proud to learn, now faces life with a smattering of Menckenese sophistication and very little else. Taught to think that the world was his oyster, he now discovers that it is a particularly tough abalone. —*The Argonaut.*

* * * *

The man who becomes absorbed in doing his job and who finds adventure and happiness in making himself as useful, as creative, as productive as he knows how, is quite as likely to find himself moving up the ladder as the one who is thinking and worrying all the time about getting recognition and advancement.—*James D. Mooney.*

* * * *

A new type of creative artist is the business man, who by some peculiar faculty denied to the rest of us, is able to take ordinary men and materials and handle them so imaginatively that tens of thousands of people enjoy a superior existence.

* * * *

Basic economic conditions are sound, inventories not unduly expanded, credits and collections satisfactory, earnings of labor are high and employment steady, all of which presage a favorable outlook for 1929. —*Gerard W. Swope.*

Competition

How Will It Affect the UTILITY ENGINEER?

By C. A. COLLIER

"PRETTY soft! Pretty soft!" More than one salesman, central station or otherwise, has had this envious thought when under the pressure of quotas, direct and indirect competition, and the insatiable appetite of a modern sales department for more and more fodder in the form of orders. And while his think-wheels grind out the refrain, "Pretty soft!" he's more than likely thinking of the engineer—the fellow who, while he must occasionally work long hours under intensive, physical hardship, is not constantly harassed by will-o'-the-wisp quotas, hardboiled, flighty, temperamental, punching, complaining, "inspirational," driving, crazy, wonderful, or otherwise peculiar, though quite human, sales managers.

The engineer has often sat back musing over cycles and frequencies and grounds and load factors and other factors, dreaming on ways how science may help him correct these troubles. He has smiled at the poor devil of a salesman to whom calamity comes swiftly and suddenly when he lets up ever so slightly in his hurrying and scurrying for more business—calamity aided and abetted by competitors selling the same commodity, competitors selling commodities seemingly entirely foreign, yet costing dollars to buy, and by employers who still maintain that a salesman who doesn't sell isn't a salesman.

Science Comes to the Engineer's Rescue

Science has always come to the engineer's rescue, and he has corrected many of the things that have troubled him. The imperfections of electric utility service so common not so many years ago have been largely eliminated, albeit in their elimination costly engineering mistakes may have been made.

When a salesman makes the costly mistake of not producing any business for a month or two . . . well, he "gets the gate." In times past when more or less mediocre engineers made mistakes, the ultimate cost of which ran into the thousands of dollars and more, their misfortune was laid to the idiosyncrasies of the stuff they were working with, rather than to their inferior ability, and while quite a hullabaloo was frequently raised, some other major trouble developed before the whys and wherefores of the first hullabaloo were found out. Time, the enemy of the mediocre salesman, thus became the friend of the mediocre engineer by causing his earlier mistakes to be swiftly forgotten.

Mr. Collier is Vice-President of the Georgia Power Company in charge of commercial activities. He is a graduate of the Georgia School of Technology and a part of his public utility experience has been in an engineering capacity. He has been active in association work and is now President of the Southeastern Division, N. E. L. A.

The cruder shortcomings of rendering adequate electric service eliminated by efficient engineers, the astounding revelation is that in the face of practical economy in other businesses the electric utility business has increased its invested capital per unit of sale (the kilowatt). Weak brothers in the engineering fraternity who have managed to hold important engineering positions because the business has been growing so fast that their weakness as engineers has been overlooked are being reclassified. Some are being culled out, others are being correctly tagged and put into their proper niches, and still others, a very few, whose past records have placed upon them the hallmark of quality, are being launched into the *business* stream. (Please note that I didn't say they were being given better *engineering* jobs, although their launching as business men instead of scientists will give them the opportunity to *better* their engineering jobs.)

What a Business Man Is

A business man is not merely an accountant, an engineer, or a specialist of any kind. True, he may be more proficient in engineering than he is in accounting, more proficient in salesmanship than in finance, a better advertiser than he is an inventor. So, as engineers in the utility business develop into utility business men, they will learn that the utility business of today depends not solely on engineering for its existence; not solely on sales, as salesmen are sometimes tempted to claim; not entirely on super-efficient accountants, as some try to make you think it does; and not on smooth reading advertisements telling how good the service is. It depends on a combination of all, and the sooner all departments of the business learn that *they* exist for the business, and not the *business* for them, the better for all concerned.

Now, having developed into a business man, the engineer of tomorrow in the utility business will awaken to the fact that there is a vast difference between the *efficient* operation of a system and its *economical* operation. He will learn that many of the intriguing jimcracks so delightful to the engineer's soul, while doing all the manufacturers claim for them, cost away out of proportion to their betterment of the service, or the efficiency of the service, insofar as the customer is concerned, and that this increased cost is making it harder for the *business* to hold its own against other businesses. In other words, he will suddenly learn that while no one else in the territory in which he is doing business is in the same business, and that while *apparently* he has the exclusive right to do all the electric utility business within that territory, he *does not have the exclusive claim on the dollars of the people* living in that territory! He will learn that other businesses can, by getting the dollar away from the prospect, kill the utility man's chance of more business from that prospect.

Competition by Other Businesses

The engineer will also learn that there exists in the electric utility business what many of us have failed to perceive until recently—the keenest kind of competition by other businesses for the dollar the average citizen may have reposing in his jeans at any random moment. He would perhaps find, if he took a careful survey of trouser pockets along approved engineering lines and compared his results with the results of a similar survey which may have been taken by pants manufacturers a number of years ago, that holes in trousers pockets, or patched pants pockets, are now far, far fewer than formerly. He would perhaps then come to the logical conclusion that the reason for this is because of the fact that fewer dollars reach the inside of the breeches coin-repository—or that the dollars come out the top of the pockets so fast and furiously that they don't have time to wear holes.

He would further conclude that this was not because there are fewer shekels, but because there are more and louder appeals, "BUY!" not only at this particular store against that, but "BUY!" an automobile in preference to a radio, no matter from whom you buy it. "BUY!" milk in preference to reducing potions, regardless of the dairy which offers it. "BUY!" a trip to Florida instead of a fur coat, regardless of the railroad you ride on. "BUY!" shrubbery for your yard instead of paint for your house. "BUY!" an oil burner so you won't have to shovel coal.

The Industry That Gets the Dollar

He will ponder over these things, he will investigate, he will do many things, and then he will learn that the industry that gets the dollars is the industry that—

1. Makes a product, or renders a service, of high quality.
2. Delivers it efficiently.
3. Sells at a price which makes its product seem more desirable than the product (perhaps dissimilar but almost equally desirable) of another industry.
4. Collects the money due it.
5. Advertises consistently and constantly.

He will learn that the word "price" has not only to do with the selling and buying of commodities, but also with the volume or amounts of sales, and the amount of profits. Also, that price frequently prevents sales and consequently profits, and that reduced prices frequently make an industry prosperous, and perhaps just as frequently make it a bankrupt.

A Non-profit Business

Now in some respects the electric utility business is different from other businesses. In the first place, it is a non-profit business. It may earn a fair return on its money, but profits in the same sense as applied to other business are taboo. It has the exclusive right to sell electricity over wires in a given territory. Its business methods and books are open to public view. Otherwise its business is similar to any other business. It must offer its product at such a price so that its use will not be restricted. It must offer it at a price so that in the everlasting combat for the consumer's dollar there will be a tendency for him to get it changed into nickels, dimes and quarters, and spend a few more of them with the electric utility in his community. And if the price is too high, if it can't earn a fair return on the invested capital, then something must be done to increase sales. And the easiest way to increase sales of kilowatts or kumquats, peanuts or percolators, radios or race horses, is to reduce the price without impairing the quality. But, woe unto him who reduces prices below his costs! His sales will jump, but farewell profits, farewell fair returns on invested capital, farewell business!

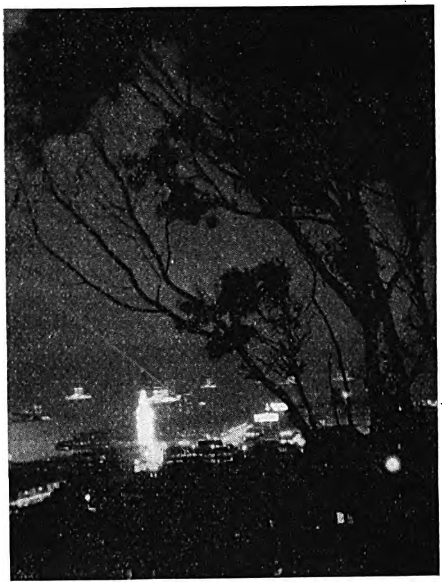
Now in the utility business, being a business operated at cost, it is obviously impossible to reduce prices without reducing them below the cost of production, unless the cost of production has first been lessened.

Where the Engineer Steps In

This is where the engineer of the utility business of today steps in. It is his job, as the manufacturing end of the business, to make his kilowatts so economically, to deliver them so efficiently that the sales department can sell them at a price to induce their wider and fuller use, and the collection department collect for them with a minimum of grief. One of the ways of reducing the cost of production in an industrial plant is to turn out more of a product without increasing the machinery or factory space. One of the ways of reducing the cost of the product of the utility business is to manufacture *more* kilowatts at the *least* investment per kilowatt.

When the engineer does that, the price can be reduced, the salesman can sell more of them or sell products which will induce their wider use, the fair return on the investors' dollar will not be endangered, and millions of mothers and fathers will no longer have to say, "For heaven's sake, Johhny! switch out the lights when you leave the room. They cost money!"

The good engineer of today and tomorrow has a bigger opportunity in the electric utility business than ever before, if he will but become a *business man* too! Nothing can retard the advancement of an engineer who has admixed his technical knowledge with the sort of business-sense so necessary to the sound progress of the industry.



LIGHTS OF THE CITY

I love the nights of the city.
When the myriad lights come on
And gleam through the dark with pity
From dusk to the early dawn.

They charm and beckon me ever
And beauty of night would be gone
If I thought again I might never
See the lights of the city come on.

—Pearl Sidney Payne in Edison Monthly.

The History of a Troublesome Problem

How INDUCTIVE COORDINATION Is Solving It

By J. C. Martin

INDUCTIVE coordination seems like a very modern term to most of us. Its predecessor, Inductive Interference, seems only a little less modern. However, its effects are as old as our industry. Its first appearance of any consequence was in connection with the relation between street railway systems and telephone systems which were first built on the ground return plan. Street railways began development after the telephone systems and made use of the earth in parallel with track rails as a return circuit. While the causes and effects in this field are not the same as what we now call inductive coordination, they were, in effect, merely another phase of what is a common problem arising out of the necessity for the various branches of the electrical industry to live and do business in the same physical areas.

One branch alone in an area can do things and conduct itself in a way that it cannot do when another enters the same area. The problem is fundamentally the same that exists in any human relations where communities are developing from what previously have been isolated individuals.

Adjustment Must Be Mutual

The greater the number of individuals in a group, the more complex their relations become and the greater the adjustments individuals must make to avoid interference with the rights of others. The duties are mutual and the adjustments are also mutual if justice is done to all. In the end the adjustments which involve individual sacrifice are the price of the advantages which the grouping gives. The compensations overbear the cost and the net result is a profit. I have long been convinced that until we view the problem of inductive coordination against this background we can have no hope of a satisfactory answer to the problem. Any other background leads inevitably to a dog-eat-dog situation in which the various branches of the industry and the community suffer.

Inductive interference is merely an uncontrolled manifestation of the most useful electrical property we have. Induction in our generators and transformers is the foundation of their operation. Linking this phenomena with so-called inductive coordination is a somewhat difficult mental feat for most of us. This is undoubtedly due to the fact that in one case controlled manifestation is producing a useful result that we have come to accept as a matter of course. The methods of control are well understood. In the other the methods of control have not been developed. We have paid no great amount of attention to the phenomena. Consequently it hits us unexpectedly and, because we do not fully grasp its significance and it sometimes proves distinctly embarrassing, we resent the problem. Resentment takes the lead and we are inclined to look at the phenomena as a new and decidedly unwelcome problem.

Mr. Martin in addition to his engineering experience with electric light and power organizations was at one time Western editor for the "Electrical World." He has been with the Middle West Utilities Company since 1923.

He became actively identified with Inductive Co-ordination work in 1921, and was Chairman of the Inductive Co-ordination Committee for two years. This address was given before a recent meeting of the Great Lakes Division, N. E. L. A. Engineering Section.

First Manifestation of the Problem

Historically its first manifestation as a commercial problem is the old familiar "cross talk" problem in telephone circuits. When there were only a few ground return telephone circuits operating over short distances the effect was unimportant. When the number of circuits multiplied, length increased and it also became necessary to place a number of such circuits on the same pole line, the interference with commercial results became such that some method of control became necessary. The metallic telephone circuit and the early transposition schemes which were relatively simple were the remedy for this particular kind of interference.

The period of development of this particular kind of inductive trouble may be roughly stated as between 1880 and 1890. It was one of the strong factors in the general change from grounded to metallic circuits for important telephone service which took place largely between 1890 and 1900. The dates given are only approximate since, like all developments, all practices were not abruptly abandoned and the new substituted. At this time, thirty years later, the ground return circuit for telephone service is widely used. The transition is still proceeding as conditions and service requirements change from the simple to a slightly more complex condition that the ground return telephone circuit cannot meet.

Through the late '80s and the '90s the electric street and interurban railways had a tremendous growth. Both the telephone and railway systems were attempting to use the earth as one side of their circuit. The result was what might be called "conductive interference" with the telephone circuits. If either had to abandon the use of the earth it meant a rather heavy expenditure for the reconstruction of existing plant facilities. The argument went to the courts and the electric railway systems won largely on the basis they were using the highways for transportation purposes and were, therefore, entitled to greater consideration in the public interest. This was a rough and tumble legal wrangle which could or would not be staged under the conditions which exist today. Today's conditions are so much more complex it is certain such a method would require so much time that it would render it valueless. It is entirely probable that the number of problems which would require settlement are too numerous and complex to be handled by court procedure. In any event we have learned that working out these problems in a friendly cooperative spirit leads to a better and more satisfactory solution than could be obtained by court action.

Battle Between A. C. and D. C.

From about 1885 to just after 1890 the battle between the direct and alternating current systems of distribution took place. As a side light it may prove interesting to some to go back to the electrical literature of the time and learn how impractical and even thoroughly dangerous the alternating current system is. 1100 volts in the view of individuals, at least, was a catastrophe and the term was considered mild.

Beginning roughly with 1890 the light and power distribution systems appeared in the inductive picture, adding complication to the general problem of inductive relations between electrical systems or circuits of different kinds. Through the '90s at least they could not be said to be much of a factor, but by the latter part of the period from 1900 to 1910, they were definitely in the picture, though still largely from the angle of low voltage circuits. However, during this period the transmission line ranging in voltages up to 66,000 had developed rapidly and during the latter part of the period the higher voltage transmission lines appeared definitely.

First Organized Effort to Study Problem

Culminating in 1911 in a set of specifications governing joint use construction, a large amount of work was done by an N. E. L. A. committee and by representatives of the telephone interests. It was in these specifications that the first hint of inductive problems appeared in a national way. Such mention as was made was incidental and was not featured as a matter of primary importance.

The first organized effort at a study of the problem appeared in California in 1912 when a committee representing the California Railroad Commission, the railroad interests, telephone and telegraph and the power interests was organized. A preliminary report of investigations was made in July, 1914, and a final report on September 28, 1917. Out of the work came a tentative set of rules promulgated in 1914 by the California Railroad Commission and a final revision of these rules in 1917 based on the final report.

The extensive network of transmission lines in California had produced an acute situation in the inductive relations between the power and telephone circuits. It may be said here that the power companies had not been entirely considerate of the position of the telephone companies, and, due to a lack of knowledge of the problem, failed in a number of ways to realize or recognize that a problem really existed. This attitude was not peculiar to California power companies. It was the general attitude of the power companies of the entire country at the time. A great deal of feeling and controversy grew out of the situation at that time. The attitude of the power companies was clearly revealed when an attempt was made in 1916 in the East to raise a few thousand dollars to assist the California power companies in the investigational work of the California committees which resulted in the final report.

The attempt was unsuccessful, due to the total lack of interest on the part of power company executives. They could not realize that the problem was as much theirs as it was that of the California companies.

N. E. L. A. Takes Up Problem

The entire problem appeared for the first time in an official way in the 1915 and 1916 Overhead Systems Committee of the National Electric Light Association. This was followed by the organization of the Inductive Interference Committee which finally became the Committee on Inductive Coordination. By 1920 the work was recognized as a definite official part of the N. E. L. A. technical work. At this time the only visible problem was that involving the Bell System interests, though it was realized that this represented only one phase of the entire problem. Both the Bell System and N. E. L. A. leaders realized that the probable outcome of the existing situation was a long wrangle and probable legal battle that would be costly and

Bird Pecks Power Line and City's Lights Go Out

ROCHESTER, N. Y., Dec. 17 (A. P.)—A forty-minute tie-up in electric light and power service in a large part of the city and a two-minute flicker throughout the downtown district today heralded the passing of a bird, species unknown, which sought nourishment from one of the high tension cables of the Rochester Gas and Electric Corporation. When emergency crews arrived to straighten out the short circuits and fire caused by the experiment, they found a charred and feathered mass about the size of a robin.—*New York World.*

* * * *

It probably wasn't nourishment he stopped for.

Isn't That So?

Pittsville, Wisconsin.
December 3.

National Electric Light Association,
420 Lexington Avenue,
New York, N. Y.

Dear Sirs:

I am a high school student who has studied some on electricity and I just was wondering *what you would do if you could get the definition for electricity.* If you will answer I will give you a good outline to follow for solving this problem.

Sincerely yours,
CHARLES CHRISTENSEN.

* * * *

No telling what we wouldn't do.

* * * *

Pittsville, Wisconsin.
December 17.

National Electric Light Association,
420 Lexington Avenue,
New York, N. Y.

Dear Sirs:

The only definition I can give for electricity is this.

Electricity is a gaseous which mixes with the air. The things which make me think that this statement is true are as follows:

There is electricity in the air, you all know that. The body uses electricity; it must get it when breathing the air. What causes this electricity to come and go into these wires is the generator has some electricity in it. This electricity draws more electricity until it gets an over-supply of electricity, and has to send electricity out some way, so it goes into the wires. The turning of the generator gives the electricity current enough to draw more electricity.

If you wish any more proof I can send more.

Yours truly.
CHARLES CHRISTENSEN.

* * * *

At that Charles knows as much about electricity as some of his alleged betters who talk and write on the subject.

May keep us warm in bed,
But won't the hopeful bachelor
Try married life instead?
Buckshots—Porgy Power Co.

which probably would not produce satisfactory results.

After careful consideration, the Joint General Committee, representing both interests, was formed to study the problem cooperatively and handle it in a businesslike way. That work to date has produced as printed documents: Principles and Practices for the Inductive Coordination of Supply and Signal Systems, Principles and Practices for the Joint Use of Wood Poles and Inductive Coordination, Allocation of Cost between Supply and Communication Companies, on a Cooperative Development and Research program dealing with various factors in the technical phases of the situation. I shall not attempt to detail this recent history. However, it must be realized that this work is the foundation of our entire problem as it affects the telephone interests. The work is only partly completed and will require several years more. That it will be succeeded by similar problems is certain, since the problems arise out of the growth of the two branches of the industry.

Telephone Work Only One Phase

That the telephone work is only one phase of the situation has been illustrated since 1920 from unexpected sources. That the telegraph interests were also involved, and to some extent railway signal systems, was known, but the problems had apparently not been acute. Almost simultaneously from 1923 to 1926 two entirely new phases appeared. Radio broadcasting literally flashed into view, producing in the space of that time problems as many and, because of their direct public relations phases, as difficult as those which had previously developed in the relations with telephone systems. At the same time automatic train control systems, under orders from the Interstate Commerce Commission, appeared in the picture. These developments you are familiar with. It seems at present that automatic train control problems, from an inductive relation standpoint, are not likely to reach an acute stage. The problem has been recognized early in the developmental stage of the apparatus. Further, the fact that railway electrification is a live problem has undoubtedly provided an incentive to an early solution of the inductive relations side of the problem.

Radio interference troubles are still with us, with every prospect of being a permanent and exceedingly active guest. Apparently, however, the acute stage of this problem is past and we have a firm grasp of it that will enable us to keep ahead of the game.

More Electricana

You Bet It Does!

The last annual report of The Public Ownership League of America states that it has campaigned against the indeterminate permit legislation, conducted numerous municipal ownership campaigns, given lectures, held debates, and conferences, etc., in nine different States, promoted public power districts, continued the fight for government operation of Muscle Shoals, Boulder Canyon and other federal hydroelectric projects, and continues: "Such an educational campaign is greatly needed to counteract the propaganda of the private power companies and inform the public."

The North Central Electric Association News for November comments: "It will be noted that what the private companies do is propaganda and what The Public Ownership League does is educational. It makes a difference whose meal is frying, doesn't it?"

Official Buried Alive to Cure Electric Shock

PRAGUE, CZECHOSLOVAKIA, Nov. 29 (A. P.)—Town Councillor, Kutclera, of the little Moravian town of Rakova, was deliberately buried alive after being rendered unconscious by coming in contact accidentally with a highly charged electric wire.

Upon the advice of a woman doctor of the village, he was placed in a hole in the ground in the belief that the earth would absorb the electricity from his body.

But when dug up after thirty minutes interment, Kutclera was dead.

Senator Introduces Bill

—Headline in Most Any Paper

WASHINGTON, D. C., (Special Correspondence).—Stringent legislation designed to control certain alleged pernicious activities of individuals affiliated with the electric light and power industry will soon be introduced into Congress. The new legislation, we are advised by an unimpeachable source, is sensational in its stringency, the police practices of leading countries of the world including Russia, both under the Czar and the Bolsheviki, having been drawn upon.

All persons now employed by operating, holding, management or finance companies in the electric field, and those employees of concerns in other fields, who come in contact with public utility organizations of any kind will be required to register. A special office patterned after the Soviet central police bureau will be charged with this duty. Registration will involve the filing of complete family history, photographs, finger prints and Bertillon measurements and registrants will be required to sign a waiver of immunity and a pledge not to invoke those clauses of the Constitution dealing with unreasonable search and seizure.

Severe penalties are provided in the contemplated legislation for those misguided or wicked persons who persist in retaining their pernicious employment. In order that employees of these utilities may have an opportunity to understand their precarious situation, certain minor limitations are set on their personal conduct. For instance, starched collars are prohibited to the men, and the women employees under the age of sixty may not bob their hair. These and other regulations of the same nature will remain in force for a three-year period, at the end of which it will be assumed that all persons still in the employ of the proscribed businesses are irrevocably steeped in what is sometimes termed the "spirit of public service." These reprobates will lose their citizenship. The women will be branded on the brawn of the left thumb and the right ear will be cut from all the men. The authors of the bill confidently expect that some considerable time before the expiration of the three years grace, the electric light and power companies will have no employees.

This legislation, there is reason to believe, will in no way apply to employees of municipally owned and operated electric light and power plants.

* * * *

Will it come to this?

Last, and far from least, the telegraph problem is in the picture actively. Last year a Joint Committee with the Western Union was formed and will be heard from with its contribution in the near future. There is every probability that the development of newer and more sensitive telegraph devices will provide their share of problems. A great many developments are taking place very rapidly.

What the Industry Should Do

In conclusion, I want to again call attention to my opening comparison between the adjustments that occur when individuals pass from the stage of isolated units dependent only on themselves to communities where the relations between individuals become complex. Our complex community relations have existed so long that they have become second nature. Our own experience with them has been since childhood, so that we have never thought of the restrictions we are subject to as restrictions.

As an industry, we are now barely out of the period when the various phases of the electrical industry could and did exist as isolated individuals. As workers we are still living largely in the mental atmosphere of the individualistic period of the industry. In the foregoing I have traced very briefly the growth of industry complexity as it affects inductive relations. What the next new factors may be, no one can predict. It is certain that the constant growth of population and its accompanying growth of utility service will increase the complexity of our intra-industry problem of handling inductive relations. As in our community relations, we will probably find increasing restrictions of one character or another for the good of the public we serve. Our greatest problem is that of designing our various systems and maintaining an attitude toward each other that will keep legislative restrictions to the minimum, or, if possible, non-existent. We know that the better the attitude toward each other and the public on the part of the various parts of the electrical industry, the smaller those legislative restrictions will be. What they are and how severe they will be is a matter almost altogether in our hands.

The Electric Light and Power Industry During 1928

REVIEWED BY THE DEPARTMENT OF PUBLIC INFORMATION, N. E. L. A.

CONTINUED expansion of facilities by the electric light and power industry and a greater diffusion of its service to all classes of consumers was a feature of public utility operation in 1928. The production of electricity by all agencies which contribute to the public supply, according to the preliminary estimate of the United States Geological Survey was approximately 88,000,000,000 kw-hr., in addition to which another 1,600,000,000 kw-hr. was imported from Canada. This total available supply was as much as the production of all the rest of the world. During the past seven years, the industry has added more than 13,500,000 kw. to generating capacity; it has constructed nearly 50,000 miles of high voltage transmission lines; doubled the output of its energy and increased the number of its customers by more than 10,000,000.

New Consumers

Approximately, 1,400,000 new consumers were added during 1928, making a total of 23,000,000 now served by this industry. Of these, nearly 19,000,000 are household users, indicating the rapid increase in the diffusion of electric service to the homes of the nation. Twenty-five years ago, the total number of all consumers was 650,000. Electric service has now been extended to every city with a population of 5000 and over; to 97 per cent of all communities with populations between 1000 and 5000; to 50 per cent of all communities between 250 and 1000; and to more than 25 per cent of all hamlets of less than 250 population.

Farms connected with the electric power lines in the last three years have increased by over 125,000, making a total of nearly 350,000 farms now enjoying electric service. The increasing activity of the light and power companies in promoting the further expansion of this service is indicated by the fact that more than 400 men are now devoting their entire attention to the extension of electricity to the farms of the nation. In addition to this, a comprehensive program of cooperation with farm agencies, agricultural colleges, and the United States Department of Agriculture has been further enlarged during the year.

In mining and manufacture, electricity has become the power medium of the nation and the central station power plant the point of conversion of fuel and water into energy for useful service. Local installation of boilers and engines in factories has nearly come to a standstill. Between 1919 and 1925, the total net increase of 6,500,000 hp. in factories was in electrical motors purchasing power from interconnected systems. Three-quarters of all the power in industry is now electrical and, of this electrical power, two-thirds is being purchased from the lines of the light and power enterprises. On the average, each factory wage-earner today has nearly 5 hp. at his command, or more than twice that in 1900.

New Construction

New construction has been devoted more largely to additional generating and distributing systems than to the building of large-scale transmission systems, although continued progress in the interconnection of adjacent systems and the replacement of small local power plans by service from high-tension lines has been made during the year. During 1928 several important generating plants have been completed and put into service. The more noteworthy of water power projects are the 378,000 hp. hydro-electric plant at Conowingo, Md., and its tying in with one of the largest steam-electric "power pools" of the United States; the Jordan dam of 144,000 hp. on the Coosa River in Alabama, and the 70,000 hp. plant at Bucks Creek, Cal., operating on a head of 2561 ft.—the highest which has thus far been attempted. In the field of steam generation, the year has been notable for the commencement of the State Line plant near Chicago, with an ultimate capacity of more than 1,000,000 kw.; the completion of the first unit at the Powerton plant, south and east of Chicago, and the changed aspects of the relationship between steam and water-power which the success of the new units of the Southern California Edison Company has brought about on the Pacific Coast. It is worthy of note that, for the coming year, probably because steam-generating costs are now comparable to hydro-generating costs, not one hydro-electric plant is scheduled for completion in the entire region west of the Rocky Mountains, while plans have been announced for three large steam plants and the additional installation of generators in as many more.

Progress of Interconnection

The absorption of small, isolated enterprises—both municipal and private—into larger and more economical units and the replacement of little generating plants with continuous service from the high-tension lines of the interconnected systems, has continued with increasing momentum. At the same time, the tendency toward large-scale mergers of important companies has, apparently, shown a slight decrease as compared with the previous year. Two such consolidations are, however, noteworthy: the acquisition by the United Gas Improvement Company of the Philadelphia Electric Company and the merger of the Brooklyn Edison Company and the electric companies of the Consolidated Gas System in New York City. A contributing reason for the apparent decrease in the number of mergers is found in the comparatively higher cost of money and the rise in interest rates during the second half of the year. As a result, new financing and refinancing by enterprises engaged in the operation, management or financing of electric utility properties, has fallen somewhat below figures for 1927. The total of electric utility securities sold by investment houses during 1928 is estimated to be in the neighborhood of $1,825,000,000, against approximately $1,900,000,000 in 1927. Inasmuch as an increased (but not immediately ascertainable) number of investment trusts appears to have figured in this year's total, a slight falling off during the year is apparent.

At the same time, *new construction* by the utility companies has been carried on at approximately the same rate as during the two previous years, with the result that the total investment of the electric light and power enterprises in plant and equipment at the end of 1928 was carried on the

(*Continued on page 62*)

Amplifier Calls on the Professor

By Amplifier

AMPLIFIER called on his old friend, the college professor, the other day, and the talk turned to the subject of educational material for use in public schools; that is, material other than approved text books in the official schedule.

"I see no reason," said the professor, "why any great national industry should not furnish public school systems with informational material concerning its business, provided that the text is confined to factual statements and also provided that it is presented to the schools through the proper channels. I personally have every confidence in the intelligence and honesty of the average superintendent of schools and believe that the decision to use or reject material can be safely left with him."

What Criteria?

"What criteria would you set up in judging such material offered for use in schools?" I asked.

"Well," he replied, "the first question I would ask is: 'does it fit in with modern educational tendencies?' If it does not, it can serve no useful purpose and should be rejected by the authorities, no matter what its source may be. Present day methods of teaching such fundamental subjects as Geography, History, Civics, English and Popular Science are quite different from those of 40 or even 20 years ago. Educators realize that there is a great deal more to Geography than the mere geographical location of cities, states, nations and continents; the History must take into consideration present day conditions and show how they have come about instead of being confined to a mere chronology of events; that Civics is not solely a matter of government, but must include political, social, and industrial economics; that English can be taught in such a way that the pupil will learn many other things; and that Popular Science has been broadened in scope to an extent not dreamed of a generation or two ago.

"One finds in progressive school systems everywhere," he continued, "these fundamental subjects being taught by the use of so-called supplementary readers, which in turn are supplemented with suggestions for further reading. These supplementary readers seem to deal with almost every subject except the one being taught, but, if the text is examined carefully, it will be seen that they teach the subject in a far better way than the old-fashioned text book. For example, a favorite method of teaching the History and Geography of the United States is by means of a reader on the subject of the development and progress of industry in the United States.

Examine the Material

"Then, if I should find that the material does fit in with the modern scheme of public school education, I would examine it from a standpoint of substance; its accuracy, quality, and the ideas which it presumably will instill in the minds of both teacher and pupil. If I found it to be accurate, up to date, well-organized, written in an interesting style and concerning a subject which would not only be of interest to the pupil and teacher, but a subject which both should know something about, I would then inquire into the ideas which it might instill in the minds of both. If it should contain the slightest suggestion of advertising the products of some particular concern, or if it preached any political creed, social philosophy, or industrial policy, I would reject it."

"Just what do you mean by advertising the products of 'some particular concern'?" I asked.

"Well," he replied, "I see no reason why children should not be taught the beneficial results of eating plenty of breakfast food, or drinking plenty of milk. I see every objection, however, to teaching them that some particular brand of breakfast food, or milk, is better than all the others. Or, in the case of banking, there is no reason why a banker's association should not furnish material instructing children about the fundamental principles of banking, and attempt to instill in their minds ideas of thrift. I would see every objection, however, to material which in addition to this, would urge that some particular bank in the community offers better facilities for saving than any other bank. In other words, I draw a sharp line between what we might call informational advertising and direct advertising.

Need for Additional Instruction

"I would then inquire as to whether there were any need for additional instruction in the subjects involved. Now, it frequently happens that text books on certain subjects, such as Civics and Economics, designed for use in junior and senior high school, must cover a broad field in comparatively small space. For this reason they can only touch on such subjects as transportation, communication, light and power and water supply. Yet certainly, in this day and age, no intelligent person can have the temerity to suggest that children in junior or senior high schools should not be given as much instruction as possible in these most important subjects.

"This instruction should not be confined simply to present day conditions, but should go as far as possible into the history of these great public services, show something of their development and progress, and, above everything else, describe their influence and effect on the social and economic life of the nation. The education of a large proportion of our school children ends with graduation from a senior high school. If they are to be fitted to meet the many problems of our complex civilization which those who must earn a living are called upon to face, such instruction is of paramount importance. This is particularly true when the instruction does not add to the curriculum, but only supplements instruction in what is known as fundamental subjects."

"That is all very well," I said, "but why cannot sufficient instruction in these matters be included in the text of these supplementary readers or in books on Civics and Economics? Why should the industries feel called upon to go to the expense of furnishing this class of educational material, when, as you say, it is instruction which the schools should give?"

"Your question is a perfectly proper one, but not altogether any too easy to answer," he replied. "The obvious answer is that the average text book in use today doesn't. This, of course, is not altogether the fault of the author. As I have tried to point out, he has to cover a wide field in a limited space. In the second place, it is hardly fair to expect the average teacher or college professor—and most of these text books are written by either high school teachers or college professors—to have an intimate working knowledge of the economics of street railway transportation, or the telephone and telegraph business, or the operation of a light and power plant, or the intricacies of their financial structures. In fact, there are many of them who don't know the difference between the control and regulation of a utility by the provisions of its municipal franchise and control and regulation by means of public utility laws administered by a state commission. I could show you a dozen text books dealing with these subjects that are entirely obsolete insofar as these matters are concerned. The authors are dealing with situations as they existed 20 or 25 years ago.

"Please don't misunderstand me. I don't mean that pupils in the public schools should have their heads filled up with all of the thousands of details concerning these businesses. And sometimes I think that the reason why these text book authors only play around the edges is that they think they cannot deal with them unless they include all the details, and this would occupy all of the space in their books. I do think, however, that there are certain broad fundamental principles concerning them which should be taught to every child who is not going to have the benefit of a college education.

"And so," he concluded, "we are facing a condition of fact, which is that our teachers are not being provided by the text book authors and publishers with factual information about these great influences on our daily lives. It is only natural that they should be receptive to the suggestion that this information be furnished by those who ought to know most about it—the leaders in the industries themselves. Just as long as it is factual and contains no propaganda—using the word in its most offensive sense—I can see no objection to it."

"What is the difference between the kind of propaganda you mean and educational material?" I asked.

"I can only say that in my opinion propaganda is the sort of material which appeals to the emotions and educational material is that which appeals to the intellect. And I am not so sure but what that is a perfectly good yardstick when looking at material for use in the public schools."

An Association Periodical That Gets Results

By Maude Buchanan

Editor's Note: The Editor of the Bulletin feels it incumbent to protest that he is not in agreement with Miss Buchanan's wholesale indictment of Association publications, but, on the other hand, he felt that to invoke the blue pencil would destroy, the background built up to contrast emphatically the merits of the publication of which she writes. At any rate, the editor concurs fully in her main argument—that *The Nela-Graph* is a very spirited, entertaining and useful production.

Association "magazines," generally speaking, are notorious for their lack of readers. Perhaps one of the reasons is that many of them are so dignified and "high hattish" that they cease to be interesting. There is, I am afraid, very little human interest in most of them.

The association magazine is the association's house organ. And the mortality rate of house organs is very high. Of those that survive, many, alas, are lackadaisical creations without interest sometimes to even the editor.

Shortly after the Southeastern Division of the National Electric Light Association opened permanent offices in Atlanta, the Division's Executive Secretary, C. M. Kilian, felt the need of some personalizing influence to reach those members it was impossible to reach in a personal way. The Division has some 800 individual members, so it was obviously impossible to make a personal visit to each even once a year. So a divisional bulletin was decided upon, which decision in itself is neither new nor startling.

The bulletin was given the name of *The Nela-Graph*. It is different from other association publications in the following respects:

1. It does not attempt to present to its members statistical or technical editorials or articles. The reports of the association contain such data and are available for any members interested.
2. It strives to maintain a spirit of rivalry between individual members and companies in the same manner as rivalry is stimulated between individual members of sales organizations.
3. It keeps before the executives of the companies comprising its membership the value of participation in association activities by placing before them concrete benefits of such participation.
4. It is entirely unorthodox in its make-up, typography and grammar. It is written as one man talks to another, and not in the bookish artificial rhetoric of most "official organs."
5. (*The Nela-Graph* is the "*unofficial* organ" of the Division.) It is profusely illustrated with cartoons, each of which ties in closely with the written text. Printer's type is not used, except in the reproduction of some articles quoted from some other publication. Copy for the issue is written on the typewriter, with illustrations sketched or pasted in, and the bulletin is then photo-lithographed.

The Nela-Graph is now in its third year. That it is widely read is evidenced by the many voluntary congratulatory letters received by the editor from presidents, general managers, publicity directors, committee chairmen and members; by numerous requests from those outside the circulation field of *The Nela-Graph* to be placed upon the mailing list; by inquiries as to what method is used in editing it; by requests from manufacturers for advertising space (it carries no advertising), and by voluntary contributions to its columns.

The results have been as follows:

1. As is the case with most voluntary organizations, the Southeastern Division of the National Electric Light Association functions through committees. At the time the divisional offices were established, not many of the executives of member companies were sold on the value of committees, and difficulty was experienced in getting the personnel with which to man the committees. This negative attitude on the part of executives has entirely disappeared, and men of high caliber are now readily made available for work on committees.
2. There was difficulty in getting acceptances of committee appointments. Such appointments were looked upon as more or less empty honors. This attitude has been dissipated and the Executive Secretary now receives voluntary requests for appointment on committees by executives and others.
3. The attendance at the annual conventions is now three times greater than at the time of the first issue of *The Nela-Graph.*
4. Its spirit of good-nature, subtle compliments, friendly irony and readable news have unified the thought of the rank and file of its members to the extent that an *esprit de corps* in the Division has resulted which is perhaps unequalled in any voluntary organization.

Mr. Kilian, its editor, attributes its effectiveness to the fact that its contents seem human and, therefore, quite a radical departure from the usual outpourings of statistics, technique and boiled-shirt wisdom so common in many association periodicals.

U. S. Department of Agriculture

FARM POWER SURVEY Full of Facts

By C. M. Ripley

General Electric Co., Schenectady

THE United States Department of Agriculture Bulletin No. 1348 is one of the most fascinating bits of reading—because it answers so many difficult questions.

Those printed below are but samples of the kind of information contained in this wonderful booklet.

The 30 per cent of 16 billion horse power hours bought at 5c. per kw.-hr. plus a reasonable estimate for electric light and other household uses would indicate that the 6½ million United States farms could spend approximately one million dollars a day for electricity with economy to themselves, added comfort to their families and increased output from their properties.

That Uncle Sam is in accord with the farm electrification movement will be inferred by the following extract from the foreword in the booklet:

"Agriculture in the United States uses practically as much primary power as all manufacturing and central station plants combined. The cost of using this power amounts to approximately three billion dollars for the year 1924.

"However, by the aid of this power the average agricultural worker has been able to *increase his volume of production nearly three times over the average of 75 years ago.*

"Power and labor together represent on the average about 60 per cent of the total cost of carrying on the farm business, and since these are two items directly subject to the control of the farm operator, *great opportunities exist for cutting down production costs through a better understanding of the power requirements of farm operation, through the adoption of more efficient and less expensive types of power units, and by a more extensive use of power to replace human labor.*"

The above far-visioned statement was signed by H. C. Taylor, Chief of the Bureau of Agricultural Economics; by E. W. Sheets, Chief of the Animal Husbandry Division of the Bureau of Animal Husbandy, and by Thomas H. McDonald, Chief of the Bureau of Public Roads, who together constitute the Department's committee on farm power.

And the very first paragraph of the book itself is equally inspiring, as follows:

"The adoption of labor-saving machinery, *made possible by the extensive use of power,* has been universally acknowledged as the outstanding feature of American agriculture during the past three-fourths of a century. Seventy-five years ago the average agricultural worker could care for about 12 acres of crops; now, considering the United States as a whole, he can attend to at least 34 acres, and in some States where large power units are found, the average is more than 100 acres, while on many individual farms it will run as high as 300 acres or more. At the same time the workers' hours have been considerably shortened and much of the drudgery and monotony of farm work has been eliminated."

Then follows 52 pages of text and charts of a remarkably exhaustive character, and about 20 pages of ap-

QUESTIONS	ANSWERS
1. What is the cost to the average farmer for one hour's work of one horse or one mule?	**25c. (Line 5, column "B"):**
2. What is the cost of one horsepower for one hour, when furnished by electricity?	**5c if provided by a large central station (line 5-L) 15c from a small central station (line 5-K) and 25c if made in your own farm electric plant (5-J).**
3. What does it cost for the same amount of power furnished by a windmill?	**5c. (line 5-i).**
4. Do the above costs include overhead?	**Yes, but not the cost of the operator. (And a horse needs a driver, but a motor does not.)**
5. What does it cost for one horsepower for one hour when provided by other kinds of power?	**From 4 to 20c. See line 5 on chart.**
6. What do the U. S. farmers pay every year for horse and mule power?	**2½ billion dollars.**
7. What percentage is that of the total power cost?	**81 per cent of the cost (7-b), but they do only 61 per cent of the work (7-b and 9-b).**
8. What kind of stationary farm power works the longest hours at full capacity?	**Electric power from large companies works 1200 hours per year average (10-e).**
9. What kind of stationary farm power works the shortest hours at full capacity?	**Power from belt of tractor works 88 hours per year (10-c).**
10. What are the two most expensive kinds of power?	**Work animals and private electric plants. Each costs 25c per hp. hour average (5b & j).**
11. What are the two cheapest kinds of power?	**Electricity from large central stations (5-e) and large stationary engines over 5 hp. (5-g) cost 5c and 4c. per hp. hr. respectively.**
12. What is the total cost and the average cost of all kinds of farm power?	**3 billion dollars a year for 16 billion hp. hrs. This is an average of 19c per hp. hr. or the equivalent of 25c per kw.-hr.**
13. Why is the average of 19c so close to the maximum of 25c?	**Because so many farms are using expensive power.**
14. Of the present 16 billion horse power hours used on U. S. farms annually, what percentage can be efficiently electrified now?	**30 per cent.**

POWER ON U.S. FARMS

EXCEEDS 47 MILLION HORSE POWER!
COSTS 3 BILLION DOLLARS A YEAR!
DOES 16 BILLION H.P. HOURS OF WORK YEARLY!

1924 DATA FROM
U.S. DEPT. OF AGRICULTURE
BULLETIN 1348
REARRANGED BY C.M. RIPLEY

	Kinds of Power on Farms →	HORSES, MULES, OXEN	GAS TRACTORS		STEAM DRIVEN TRACTORS	GASOLENE MOTOR TRUCKS	STATIONARY ENGINES		WIND-MILLS	INDIVIDUAL ELECTRIC PLANTS	PURCHASED ELECTRICITY		(Note: Installations Increased to over 400,000 by 1928)

pendix containing tables, explanation of methods of cost figuring and a bibliography.

The figures are for 1924, and do not show the recent improvements in farm electrification. Commercial executives can easily contrast the progress they have made in farm electrification against the situation in 1924 averaged for the whole country. Doubtless this would be inspiring to power salesmen who are developing the farm load.

And the advantage of being able to point to government figures which prove that the farms are now using expensive power, makes it easy to demonstrate the great economy of electric service. This government booklet flatly states that *large* central stations sell electricity *at 1/3 the price of small stations.* This should show the farmer that he benefits when small utilities combine with each other to make larger companies, for he then obtains not only lower rates, but standardized electricity, more reliable service and a higher type of engineering recommendations.

This booklet deserves study on the part of the commercial men and is well worth having in the library.

A Motion Picture

portraying

INDUSTRIAL ELECTRIC HEATING

How many times have you wanted to take an electric heating prospect into plants around the country where you could show just what electric heat is doing? Now—better than that—you can bring these plants right to your prospect, and there in his own town he can take a trip through industries all over the country.

How? MOTION PICTURES. The National Industrial Heating Committee of the N. E. L. A. has made a five reel motion picture film covering the fields of heat-treating, enameling, steel melting, etc. Here you have the latest applications taken in nineteen different plants to put right before your industrial customers—those who are direct prospects as well as that greater number who should be impressed with the importance of electricity in the heating field. This is an industrial men's film. Stripped of non-essentials, designed to do one thing: Promote electric heating.

The film can be bought outright or rented. Complete information on the film, including description of scenes in the film and purchase and rental prices, may be secured from Mr. H. J. Hall, Detroit Edison Co., Detroit, Mich.

INDUSTRIAL HEATING COMMITTEE

Westinghouse Engineering Developments in 1928

By F. C. Hanker

Mr. Hanker is Manager of Central Station Engineering for the Westinghouse Electric and Manufacturing Company.

In the field of major apparatus there have been made during the year numerous advances to keep pace with the demands of the industry. In the past it has been the custom to refer to the "largest this" or "most efficient that" so often that the expressions lose their force. A review is of interest, however, in fixing landmarks in the expansion of the industry, and some of the achievements are mentioned to indicate their importance in the trend of development.

Steam Electric Stations

In the field of the steam electric stations there have been some interesting units installed during the year. The largest of these is the 164,000 kw. unit being installed in the Hellgate Station of the United Electric Light & Power Company, New York. This is a cross-compound unit consisting of a high pressure element and a low pressure element, each direct-connected to generators of 80,000 kw. Each main generator has a rating of 94,200 Kv-a., 60-cycle. An exciter for both machines is directly connected to the high pressure unit and a 4000 kw. house generator is connected to the low pressure unit.

Other important units are the ones installed in the Hudson Avenue Station of the Brooklyn Edison Company, which is also a cross-compound turbine of a total capacity of 110,000 kw. in the two elements, each of which is 55,000 kw., and the 60,000 kw. single cylinder single-flow unit supplied to the Milwaukee Electric Railway & Light Company.

Higher Pressure Units

In the field of high pressure units there has been installed in the plant of the Kansas City Power and Light Company a 10,000 kw., 3600 r.p.m. unit operating with a primary pressure of 1200 lb. and a back pressure of 365 lb. This unit is interesting in that it is an example of the use of a high pressure element in the rehabilitation of existing plant. This arrangement permits the use of units already installed and increases the plant efficiency without involving the obsolescence of present investment.

One of the important advances in the turbo generator field is the development of a double entry centrifugal fan that reduces the entrance loss and provides units of large volume capacity and exceptionally high efficiency at the speeds of 1800 r.p.m and 3600 r.p.m This is of particular importance in view of the limitations in rotor diameter which restricts the area for cooling air between the shaft and the fan.

Hydro-Electric Field

In the hydro-electric field there have been several important installations in the East and Southeast of large capacity units. The Conowingo Station of the Philadelphia Electric Company was placed in commercial service during the year and is probably the most outstanding achievement in that field. The station, containing initially seven 36,000 kw. units (ultimately eleven units), is the second largest in the country, being exceeded only by the Niagara Falls Power Company station. The generators are of 40,000 Kv.-a. capacity operating at 82 r.p.m and are physically the largest that have been built. The output is transformed to 220,000 volts for transmission to the Philadelphia district.

Another interesting development in this field is the completion of the Lock 18 Station of the Southeastern Power and Light Company. This station contains four units of 25,000 kw., operating at 100 r.p.m. The generators are 29,000 Kv-a capacity and the station forms one of an important group

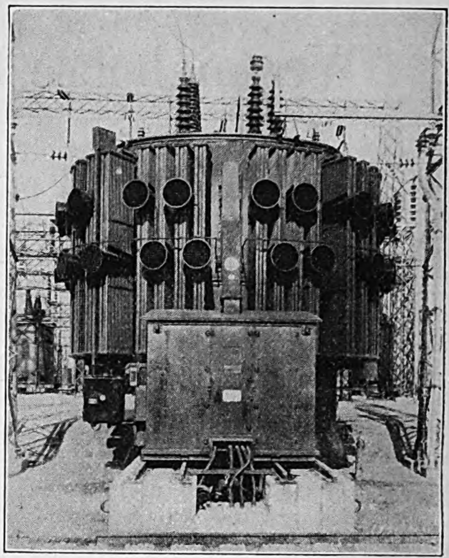
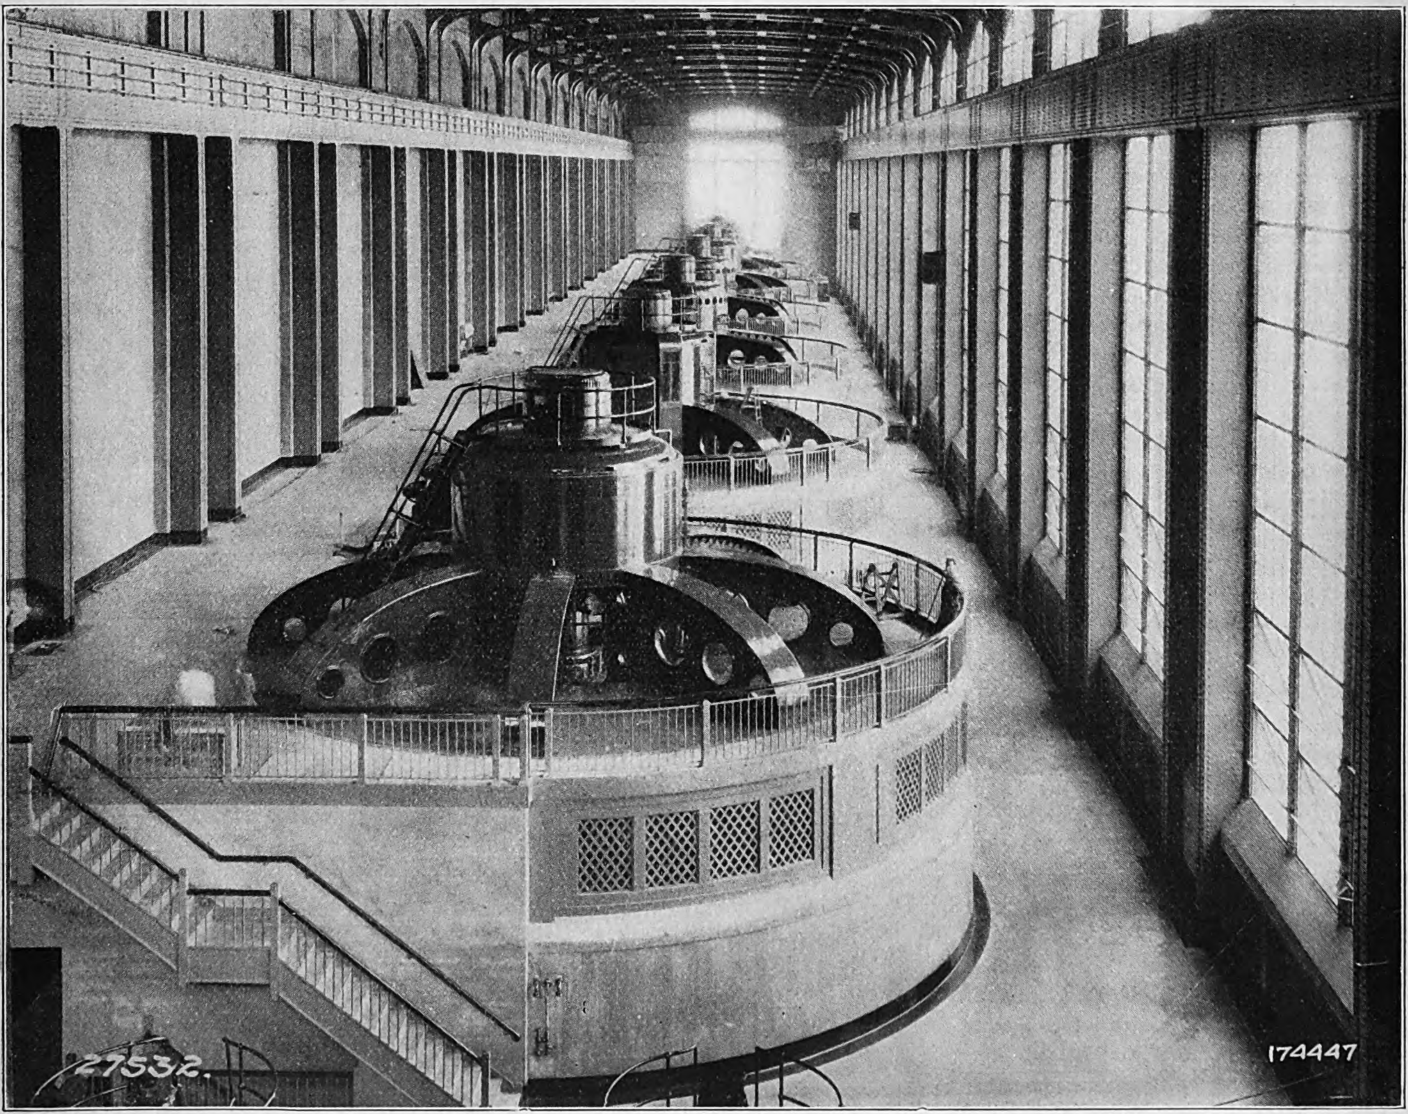
Transformer Bank at Plymouth Meeting



One of the Plymouth Meeting transformers showing tap changing mechanism

of hydro-electric developments in the Southeast.

The excitation system in the Conowingo and Lock 18 Stations are of the quick response type and represent recent developments in improving system stability through their tendency to maintain internal voltage conditions in the generator. It is now



View of the Conowingo generators installed

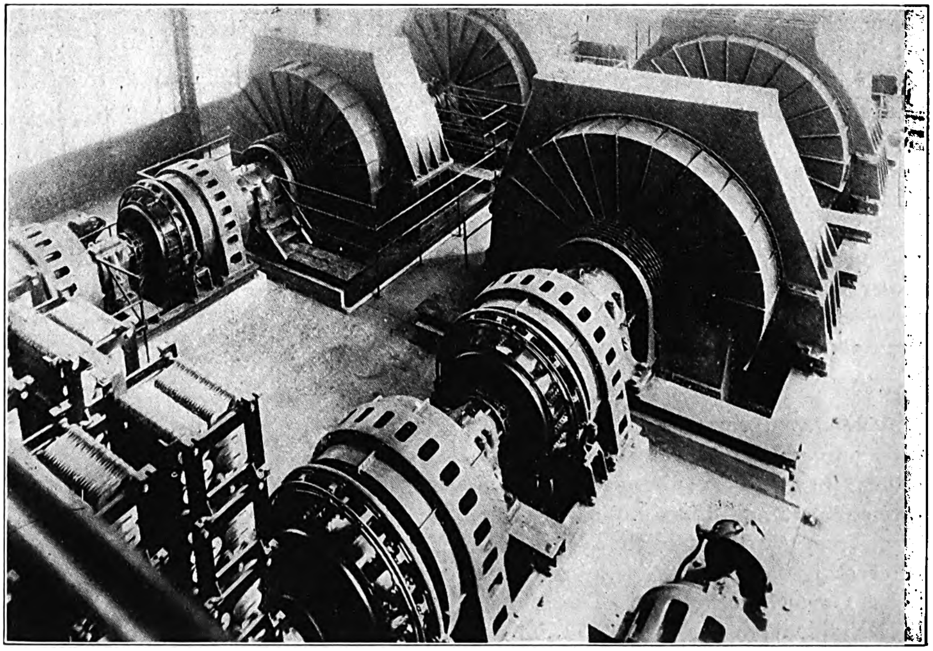
recognized that improved voltage conditions on synchronous apparatus during disturbances improve the synchronizing characteristics and system operation. In the past it has been difficult to design direct coupled exciters with satisfactory speed of voltage response. In these installations the conventional type of direct connected exciter was discarded and direct connected house generators furnishing an auxiliary bus were provided. These furnish supplies independent of the external system for the operation of motor-driven exciters giving a reliable source of drive for the excitation units unexposed to system disturbances.

Improvements in Rotating Apparatus

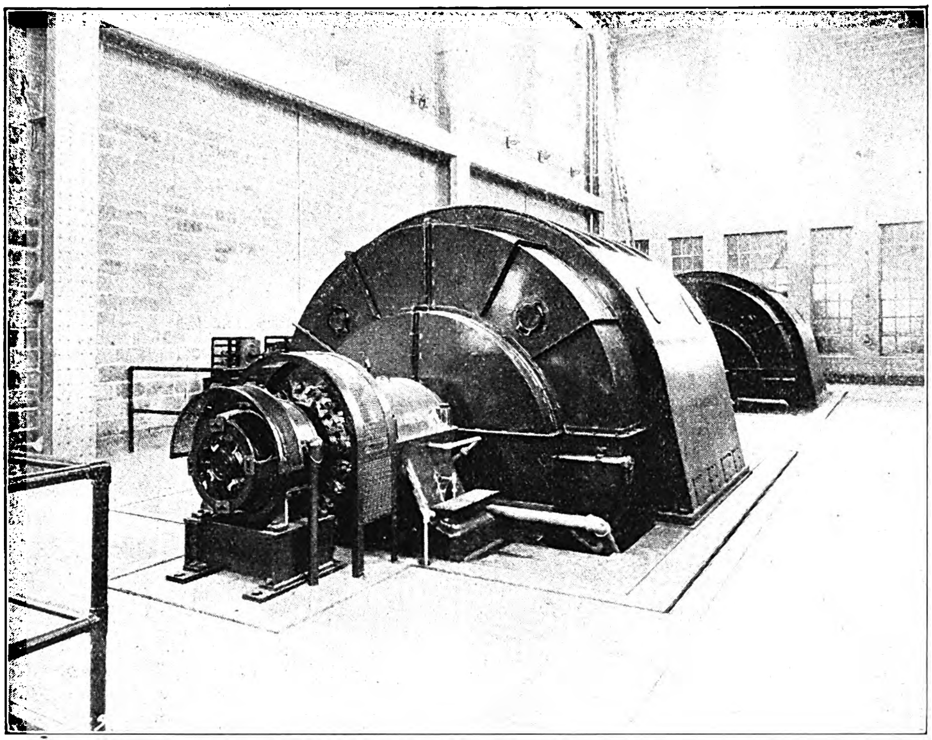
An outstanding achievement in connection with rotating apparatus has been the application of fabricated materials and welding to various lines. Standard lines of direct current generators and motors, alternating current generators, synchronous motors and synchronous condensers are now completely structural in both stator and rotor. The stationary parts of the larger synchronous machines, both waterwheel and turbo types, are of fabricated material. In the case of large turbo generators, this permits designing of the frame in such a way that much larger capacity units can be built up in the factory without exceeding shipping limitations in both dimensions and weights. The external sheet metal housing is assembled on the frame after erection to provide proper air passages for the ventilating system.

Conversion Apparatus

In the field of conversion there has been an important advance in the development of variable ratio frequency changer sets. The use of two frequencies, 25 cycles and 60 cycles, in certain portions of the country, has made it desirable to install interconnecting capacity for power interchange. These system capacities in recent years have increased so rapidly that in some cases it is not economical to install sufficient frequency conversion apparatus to insure satisfactory interconnected operation of the systems with the rigid synchronous - synchronous type of unit. In the case of the Niagara systems, the amount of power they desire to interchange was not sufficient to justify the use of the required capacity in synchronous-synchronous sets, and the variable ratio tie was provided. Two 25,000 Kv-a., 300



Two 25,000 Kv-a. 25-60 cycle, variable ratio, frequency changers installed by the Niagara, Lockport & Ontario Power Co.



Installation view of the 30,000 Kv-a. synchronous condensers for Philadelphia Electric Co. and Consumers Power Co., 98.25 per cent efficient

r.p.m., 25-60 cycle, variable ratio frequency converter equipments were installed at the Hinman Road Station of the Niagara, Lockport and Ontario Power Company. This development represents a large step in advance of previous units, being three times as large as any previous variable ratio set built in this country.

Synchronous Condensers

Considerable advance has been achieved in the construction of synchronous condensers for higher speeds, lower weights and reduced floor space. At the same time there has been a very considerable reduction in the total losses. In the past fifteen years, on units of 15,000 Kv-a., the speed has been increased approximately two and one-half times, whereas the losses have been reduced from the order of three and one-half of rating to approximately 2 per cent of rating. This illustrates the progress in permissible speed and the reduction in operating losses.

Transformers

A number of large transformers have been built during the year which show steady progress in design and performance rather than radical departure from well established practice. Interesting large units were required in the Conowingo project. These have an individual rating of 33,333 Kv-a., single phase, 60 cycle, without auxiliary cooling means, and of 43,333 Kv-a. through the addition of lower units on each radiator. These transformers are of the 3-winding type, one of 220,000 volts, one of 66,000 volts, and one of 13,000 volts for the supply to synchronous condenser regulating equipment. These units were provided with tap changing under load equipment and are of the Inertaire type.

A new type of radiator for self-cooled transformers has been developed during the year and is interesting in that the elements are manufactured by expanding with air pressure after the plates have been welded together.

Interrupting Devices

The increase in capacity of systems has necessitated active research and development work on interrupting devices. In the field of large high tension oil circuit breakers notable advances have been made in the design of large capacity high voltage equipment required for the 220 kv. network now being introduced in the East. The importance of active research and development on interrupting devices is fully recognized by the manufacturers and their facilities for fundamental study are being materially improved. The Westinghouse Company is providing testing units of 100,000 kv.-a. capacity, which in conjunction with a transformer substation will permit of testing units from the lower capacities and lower sizes to the highest voltages now in use—that is, 220,000 volts. The research work that has been carried on by the company has resulted in the development of new methods of interrupting fault circuits that will soon be placed in commercial service.

Automatic Oscillographs

One of the major problems of the operating engineer is in the system layout and scheme of operation. At the present time there are several methods in use and it is important that the utilities actively participate in the collection of fundamental data relative to the operation of present systems so that they will be in a position to determine the characteristics that would be applied to the expanded systems of tomorrow. Adequate recording equipment has been developed during the past few years giving the operating engineer the tools to study the operation of the system during disturbances that he did not formerly possess. The automatic Osisos and multi-element oscillographs represent a distinct achievement in recording apparatus.

Design of High Voltage Outdoor Substations

PART II

COMMONWEALTH EDISON COMPANY

B. G. JAMIESON

A series of six discussions on design of outdoor substations originally presented at a meeting of the 1926-1927 Electrical Apparatus Committee, Engineering National Section, H. R. Woodrow, chairman. The meeting at which these discussions were presented was conducted by the Substations Subcommittee under the chairmanship of R. A. Hentz.

Substations discussed in this series are: The Philadelphia Electric Company, by Raymond Bailey; Detroit Edison Company, by S. M. Dean; (December, 1928) Commonwealth Edison Company, by B. G. Jamieson; Pacific Gas & Electric Company, by B. D. Dexter; (this issue) Duquesne Light Company, by G. Sutherland; Alabama Power Company, by L. M. Smith (next month).

Safety

ON account of the concentration of power, the factor of safety should be carefully considered, particularly in view of the past acceptance of the outdoor location as a guarantee of safety. Instances of spread of trouble due to large volumes of oil and unlimited supply of oxygen together with the absence of barriers indicate that there is danger in relying to too great an extent on the mere factor of outdoor location without other safeguards.

System Stabilizing and Regulating Equipment

The frequent occurence of overhead and underground junctions of primary systems which must permit flow of power in more than one direction, which must be safe from the effects of lightning and which must have elements of stability that will enable service more reliable than that obtained from single generating centers calls for a design which is liberal in the extreme. There must be allowances for apparatus to control or absorb wattless current, to limit extreme voltage range either under full load or no load conditions, and for relief from excess static voltage accumulation or transients, all with provision for adequate control.

Interrupting Capacity

Owing to the increasing size of the transmission lines and the necessity for

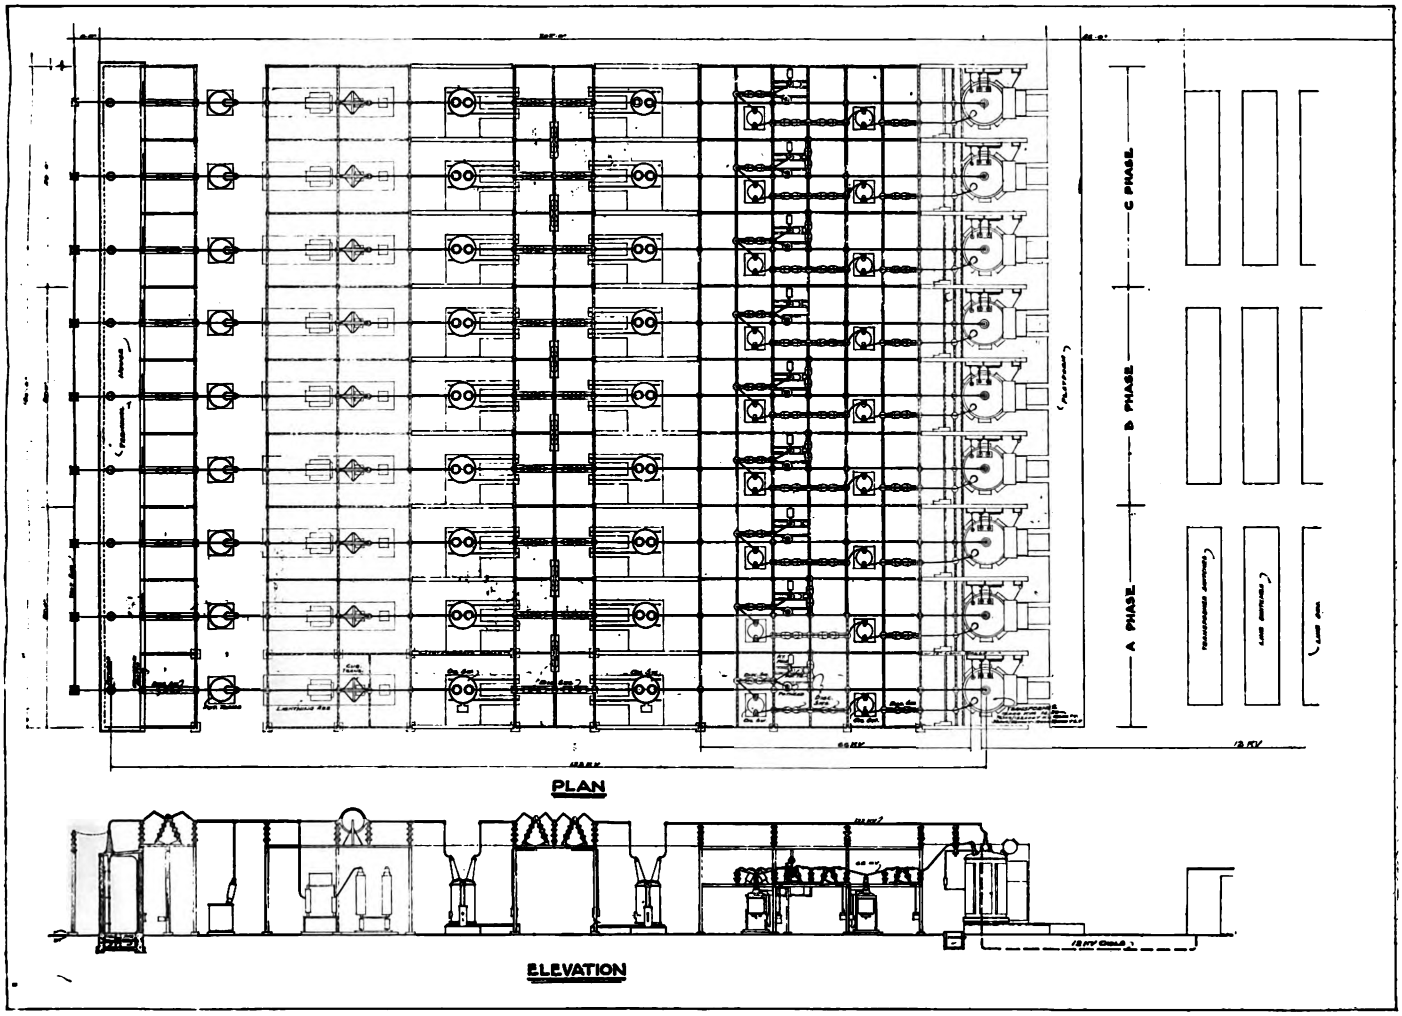

Fig. 15—High Tension Transmission Terminal—Commonwealth Edison Company

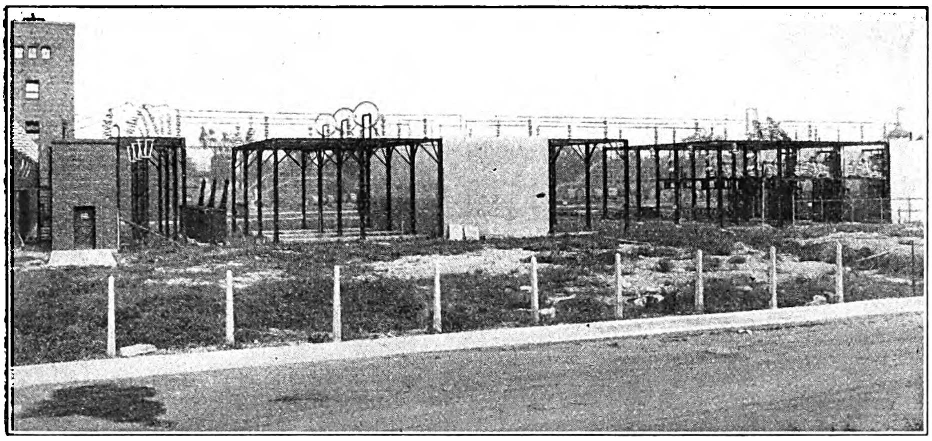

Fig. 16—Side View of Northwest Substation—Commonwealth Edison Company

interconnection, oil circuit breaker duty approaching two million kv-a. may be looked forward to. The one beneficent factor in this regard is the generally accepted assumption that arc interruption at higher voltages is less difficult than at low voltages for the same kv-a. interrupted. This advantage, however, does not obtain on the low tension side of the transformers where the energy appears with a larger proportion of amperes. It is desirable to lessen the duty on the breakers as much as possible by introducing ground resistors wherever practicable. The actual location of the breakers with respect to the vulnerable portions of the system should also be given attention, as it is desirable in the absence of barriers to protect as far as possible other vital elements of the system.

Insulation

In general the problems of insulation have been fairly well disposed of due to the considerable experience already had with the outdoor centers. There is, however, a tendency toward enclosure of conductors to a greater extent than has been the practice in the past, and as this type of electrical construction has advantages, the subject deserves attention. Care should be exercised, however, in choosing the type of covering so that in the event of there being insulation or dielectric insufficiencies proper modifications in design can be easily made without a large amount of writing-off.

Transformers

The problem of tertiary windings versus Star-Delta connections is one which is very deeply involved with the character of the service distributed from the center, the problem of relay protection and the problem of circuit breaker capacity; also with the more general factor of economy as expressed by fixed charges. If the tertiary winding can be safely accepted as a substitute for the Star-Delta from the standpoint of voltage equalization and harmonic absorption, it is then possible to get greater freedom in the matter of grounding or the establishment of neutral points. If the tertiary winding can be safely and economically used for load distribution as well as for phase balancing, the possibilities of saving in ground area otherwise required for the second bank of step-down transformers appear. If, however, the use of the tertiary winding should involve extraordinary circuit-breaking equipment by reason of the double impress of short circuit energy from the two supplying windings, there may be in this extra cost an off-setting factor to the saving of the extra transformer.

Tap changing equipment and phase shifting equipment as auxiliaries to transformers require considerable attention from the standpoint of space requirements, whether considered as external or internal or composite devices. (The function of this apparatus is, of course, properly considered under the foregoing topic, "System Stabilizing and Regulating Equipment.")

Facilities should be provided for rapid disassembly and reassembly of transformers without undue exposure to the elements, and also the problem of water supply is a considerable one as demand may reach figures of 500 gal. per minute in some cases. Attention might profitably be given to forced air cooling where water supply is a problem.

Communication Systems

The importance of these centers justifies facilities for adequate and even duplicate communication or signal systems. This may involve considerable space factor in some cases where radio is employed as with the most satisfactory form of coupling it promises to include apparatus of appreciable size.

General Structural Features

Owing to the rapid change in the potential gradient near the surface of the earth it is quite desirable to keep the structure as low as possible. For this reason as well as for reasons of economy in structure, it is desirable to avoid crossing and interlinking of buses. Until cable and encased conductors are of very much higher proved reliability, the most practicable way of eliminating the cross conductors is the use of the isolated phase system which avoids all crossing of conductors.

The low structure is, of course, also desirable from an operating point of view for tests, cleaning and other purposes. It is also clear that the low structure permits of the use of concrete in the place of steel to a greater extent than is possible with a high structure.

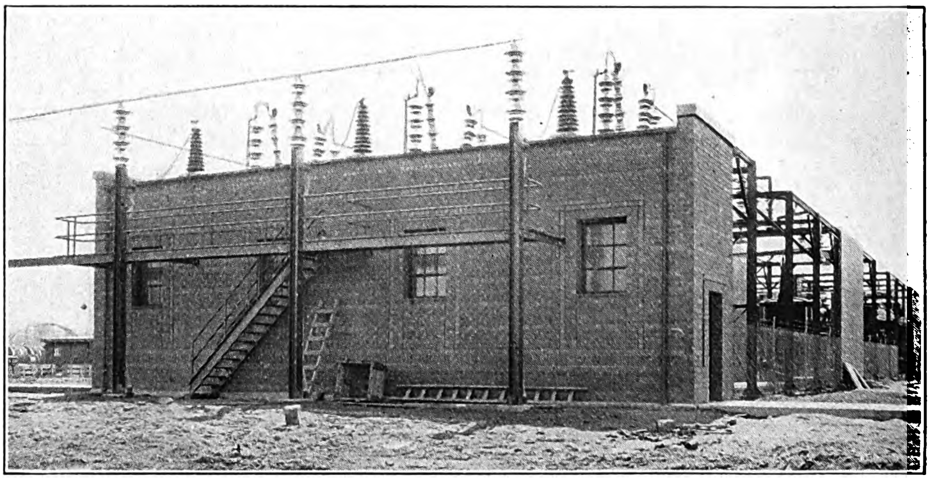

Fig. 17—Front View of Northwest Substation—Commonwealth Edison Company

Application of Above Principles in the 132 kv. Terminal Development, Commonwealth Edison Company

At the Northwest Station site in Chicago a terminal embodying the above principles has been constructed, and is now in service. The layout, as shown in Fig. 15, contemplates the following ultimate installation:

3—132 kv. cable terminals
3—Blanks of 50,000 kv-a. transformers
6—Lines at 66 kv.
32—Lines at 12 kv.
Space reservation for static dischargers or synchronous condensers.

For the sake of clearness, the longitudinal dividing walls have been omitted from this drawing, but it is readily seen how easily this construction is adapted to barrier walls between phases or between individual circuits of each phase.

Attention is invited to the following points in connection with this layout:

1. All live conductors are at minimum height from ground surface and yet sufficiently isolated by distance to provide all necessary safety for operation and construction.

2. All supporting framework is of a type that can be readily supplied from ordinary shops as it does not require stress calculations of the taller conventional structures.

3. Testing and cleaning may be done from below without hazard incident to equipment utilized for the purpose. This results from the one-level bus.

4. Buses are of minimum length and in the same plane with other conductors or branch circuits.

5. Intermediate walls or supporting structures may be erected for combined purposes of barriers and supports for emergency operations, such as lifting of parts.

6. The general low level and single plane characteristic of the conductor system make it possible to construct this type of center in locations where the high structure would be unsightly and possibly prohibitive due to lack of harmony with the surrounding buildings.

7. Conductor system may be open or closed.

8. Any experiments along the line of conductor enclosure may be made without changing the essentials of the layout.

9. Space is reserved for a ground level installation of synchronous condenser capacity with an overhead control room if and where required.

10. Connections from overhead systems may be made at either end of the development. Since the transformers are located in the center, the terminal structures at the ends may be made to take strains as required instead of acting as in the case shown merely as a cable terminal.

11. The arrangement is, generally speaking, universal with the high lines which have the better insulation at the higher levels and the lower voltage lines at the lower levels where more than two voltages are required.

NOTE: In case strict adherence to one level layout is desired, this may be accomplished by adding transformers for the third voltage with conductor system paralleling the primary system.

12. It is obvious that the space factor for group or isolated phase is the same as the major apparatus and auxiliary equipment are the big factors in the fixing of the space required.

13. The low voltage distribution units shown are factory built type embodying all elements normally required on distribution lines except the regulating equipment. Space occupied by reactors could be utilized by regulators if distribution is at 4 kv. In this case all apparatus would be outdoors except the control which would be located in the control room shown.

PACIFIC GAS AND ELECTRIC COMPANY

B. D. DEXTER

ON the high tension system of the Pacific Gas and Electric Company above 44 kv., two types of outdoor substations are employed, one known as a main line station, and the second as a distribution station. In the first case voltages are transformed from 220 kv. or 110 kv. to 60 kv., and in the second case voltages are transformed from 110 kv. or 60 kv. to 11 kv. or 4 kv. In both types of stations synchronous condensers may be installed, depending on the necessity for power factor correction.

As the designation implies, main line stations are located at points on the high voltage network where considerable amounts of power are transformed and adequate switching facilities provided. Distribution stations are placed as near as possible to the load centers of the low tension networks, or at specific consumers' plants.

In selecting property for high voltage substations, the amount varies from a usual minimum of one acre in higher priced and congested territory, to a maximum of 80 acres in the open country. In the large 200 kv. stations much space is needed for the main bus structures, connecting lines, synchronous condenser and switchboard buildings, water cooling towers, oil storage tanks, operators' quarters, garages and domestic water pumping plants.

Unlike many hydroelectric stations where the ultimate plan is carried out initially, or known to rather exact limits, the general arrangements of the substation must be laid out with considerable expansion provided, which is not usually a simple thing to do. This is due to the fact that by the time additional facilities are required new types of equipment have been perfected, conditions have changed and the original program must frequently be altered to a considerable extent; hence, it is necessary to provide ample space around all outdoor units when the station is first built.

In connection with the general arrangement of all outdoor stations of this company, attention is called to the principle of arranging, wherever possible, all structures of like character in parallel lines such as lines of terminal line towers, oil circuit breakers, bus structure, transformer banks and operating buildings. By this method extensions may be made in an orderly manner without fear of one class of equipment interfering with another. This same principle is adhered to in the condenser and switchboard buildings and permits the addition of machine bays, low tension oil circuit breaker compartments and switchboard rooms. Examples of the above method of installation are shown on the accompanying drawings of Claremont and Newark Substations.

Another feature of all substation arrangements is that the oil circuit breaker units, transformer banks and bus structures are built separated from each other. This is done for the purpose of obtaining safe clearances for workmen and to isolate equipment in order that failure of apparatus will not result in trouble being communicated to other equipment. Oil circuit breakers are usually arranged with bypass and disconnecting switches which are mounted on steel towers over the breakers.

In the main line stations where double buses are employed a single oil circuit breaker is installed on each circuit with selector switches located on

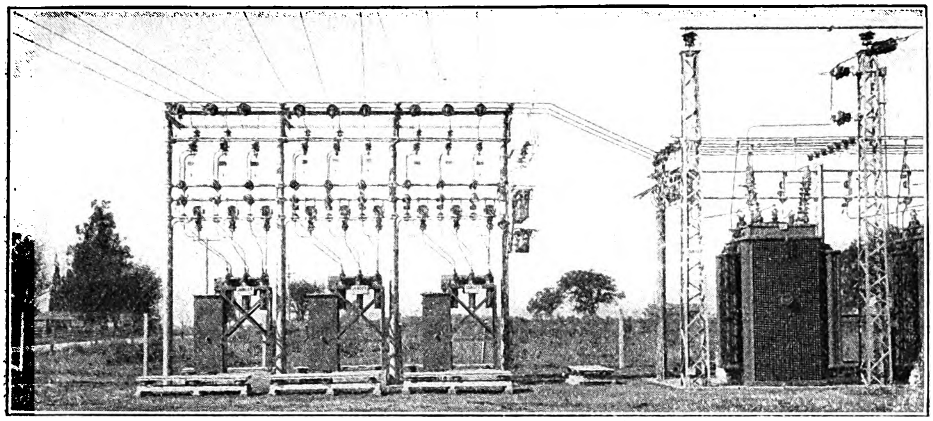

Fig. 18—Barry Substation—Pacific Gas & Electric Company

the bus structure in such a manner that a circuit may be connected to either or both buses. Where several circuits are connected to the bus, a tie breaker is usually necessary. This breaker, in addition to being useful for paralleling the buses is also put in service when a line or transformer breaker is out of service.

At the larger stations where synchronous condenser buildings are erected, transformer transfer tracks are laid between the transformer banks and the building and transformers are moved on transfer cars into the building when repairs and alterations can be made. If the substation building is not of sufficient size to permit untanking of transformers a separate transformer handling house is constructed. These structures are arranged with a pit in order that the height of the building may be kept to a minimum.

The problem of the transformer bank secondary or tertiary leads has been disposed of at the Vaca-Dixon Substation by constructing a tunnel between the 50,000 kv-a. transformer banks and the low tension oil circuit breakers, and using copper bus bars for the connections from the transformers to the breakers. This arrangement was found

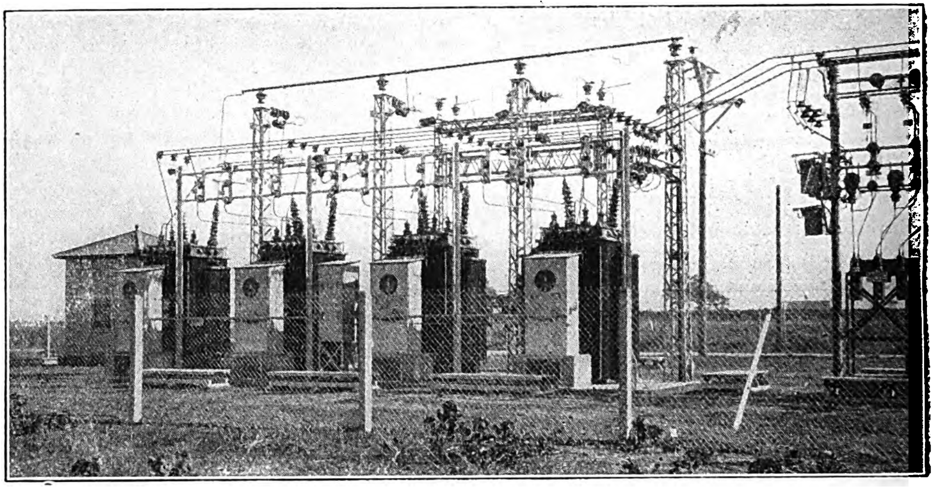

Fig. 19—Barry Substation—Pacific Gas & Electric Company

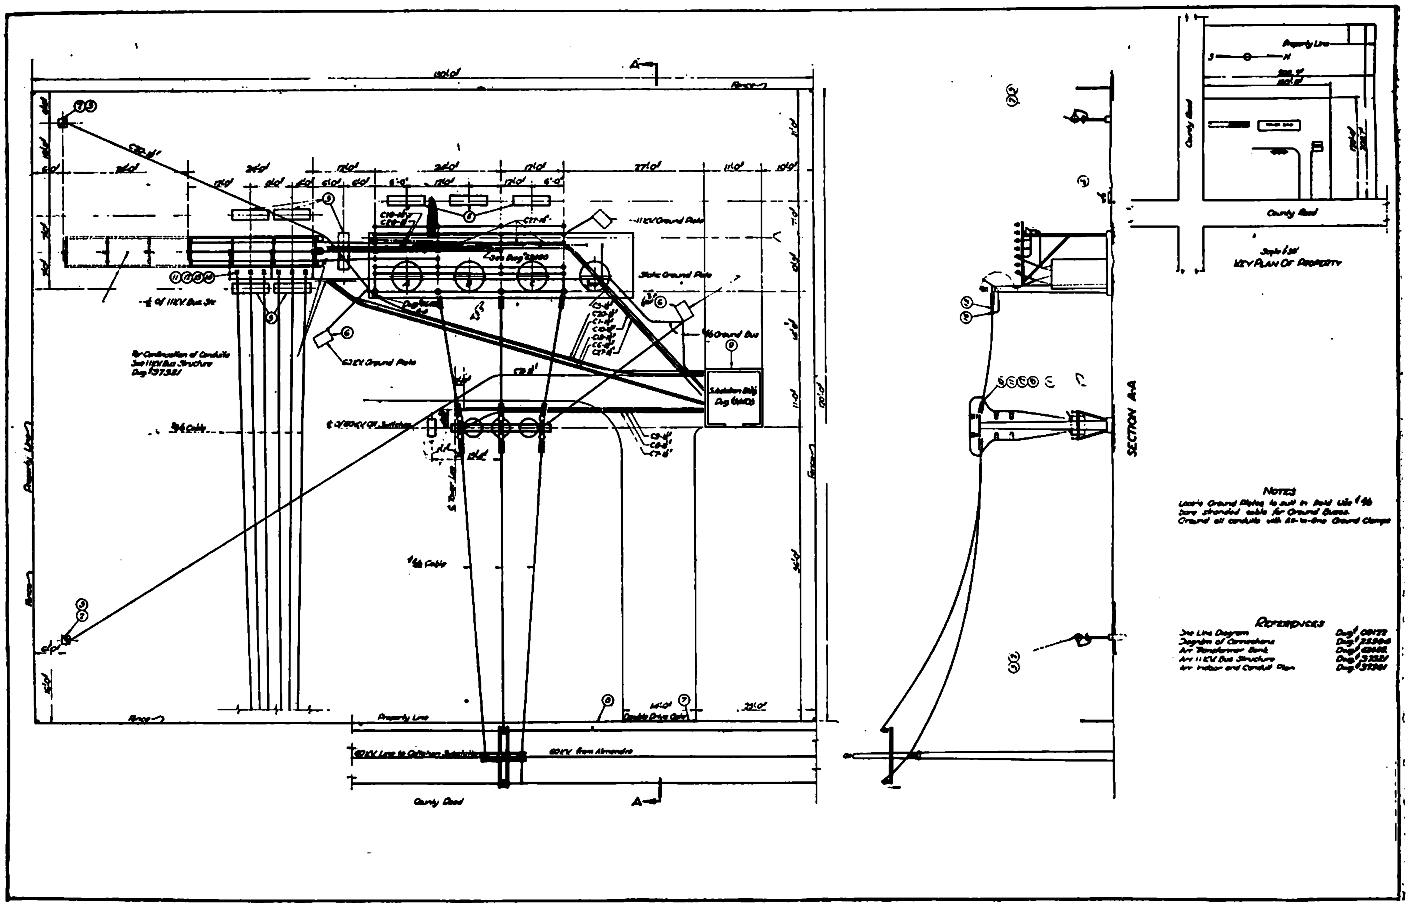

Fig. 20—General Outdoor Arrangement at Barry Substation—Pacific Gas & Electric Company

to be the most desirable due to the size and number of leads required. Starting leads for the condensers are carried in the tunnel in addition to the main tertiary leads.

At Martin Station where a 50,000 kv-a. transformer bank is installed, the secondary leads are shorter and as no starting winding is required, all connections between transformers and oil circuit breakers are made with lead covered underground cable. Attention is called to the concrete transformer secondary compartments erected at the two stations mentioned above, and drawings showing the general arrangement of these structures are shown herewith.

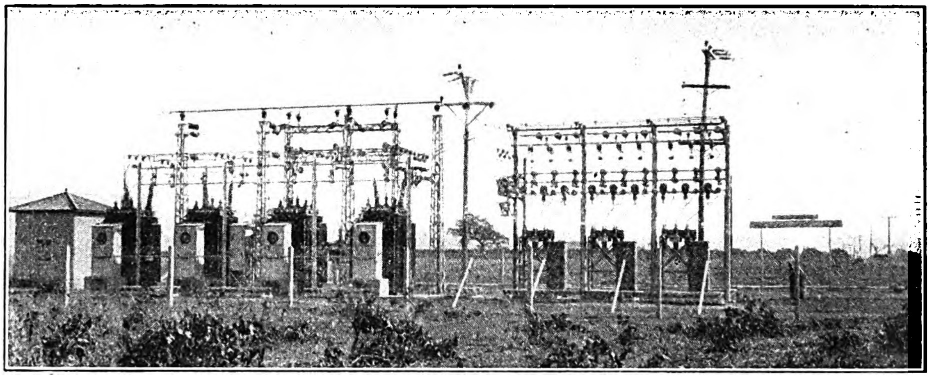

Fig. 21—Barry Substation—Pacific Gas & Electric Company

With the exception of the 220 kv. station it is the usual practice of this company to provide transfer buses and switches to cut in a spare transformer, but with the 220 kv. equipment, space requirements make this prohibitive and a damaged transformer must be moved out of place and the spare unit substituted therefor.

Illustrative of a typical rural distribution substation is the Barry Substation. The 1500 kv-a. 60 to 11 kv. transformers are controlled by means of an oil circuit breaker and protective relays are operated from bushing type transformers located in the 60 kv. breaker. Regulation at this station is obtained by use of an external tap changing switch connected to a 5 tap 10 percent regulating winding which is added to or subtracted from the main secondary winding. The tap changing

switches are connected by shafting to a motor which operates automatically to suit voltage requirements.

The feeder circuit breakers at this station are of the automatic reclosing type. These are also being applied to all new stations and many older stations will be equipped with this type of apparatus as rapidly as possible.

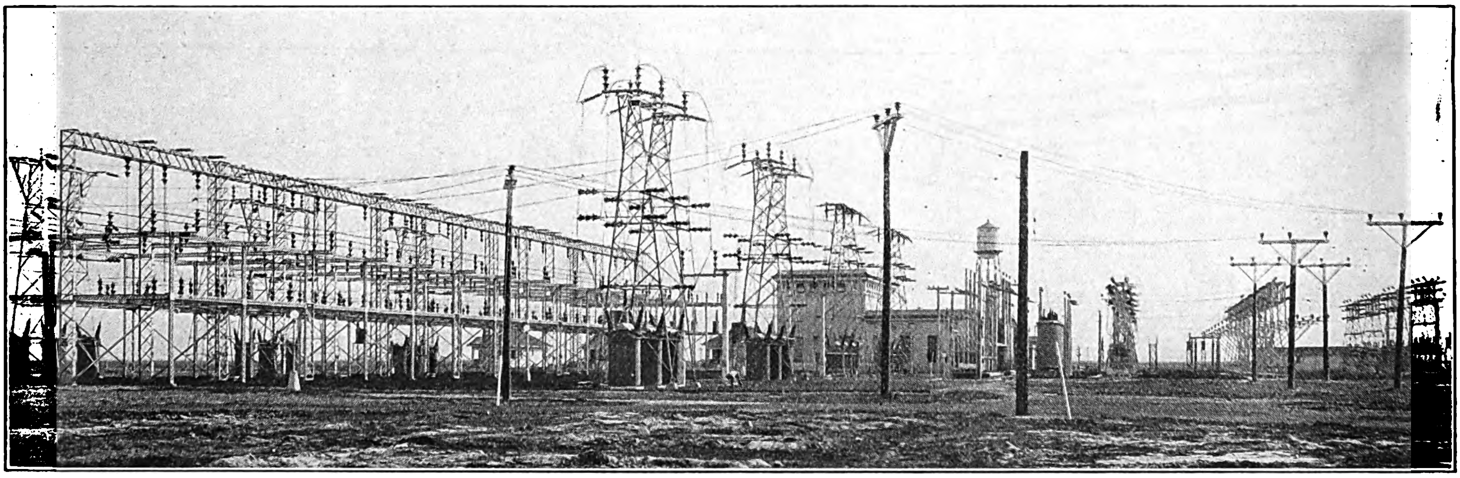

Fig. 25—Newark Substation—Pacific Gas & Electric Company

N. E. L. A. committee reports constitute a unique body of experience data, compiled and revised as progress requires by a body of volunteer workers who are authorities in their respective fields. Taken as a whole these reports constitute the operating history of the electrical industry in the United States.

The value of engineering committee reports is attested by a steady stream of orders from all parts of the world. Engineers abroad recognize the leadership of the American electrical industry and look to the reports of N. E. L. A. engineering committees for guidance.

The attention of all concerned is invited to the list of N. E. L. A. publications which appears on pages 4 and 5 of this issue.

Informing Our Customers About Our Business

By George J. Leibman

Assistant to General Sales Agent, Brooklyn Edison Company

THERE are many phases of the electric, light, and power business that our customers know little or nothing about. It is an acknowledged fact that the American public wants to know everything there is to be known, and our customers are only too glad to have the various phases of our business explained. In the words of Edward Bok, "The American Public Always Wants More, or Something a Little Better, Than It Asks for."

This knowledge of our business can be given to our customers in many ways. The simplest and most attractive way is naturally the best.

The information which customers should have is of several classes:

1. Information regarding the service and policies of the individual company.
2. Information regarding the ideals of the individual company and its attitude toward civic betterment of community growth.
3. Information regarding the proper use of appliances or equipment.
4. Information regarding the electrical industry in general.

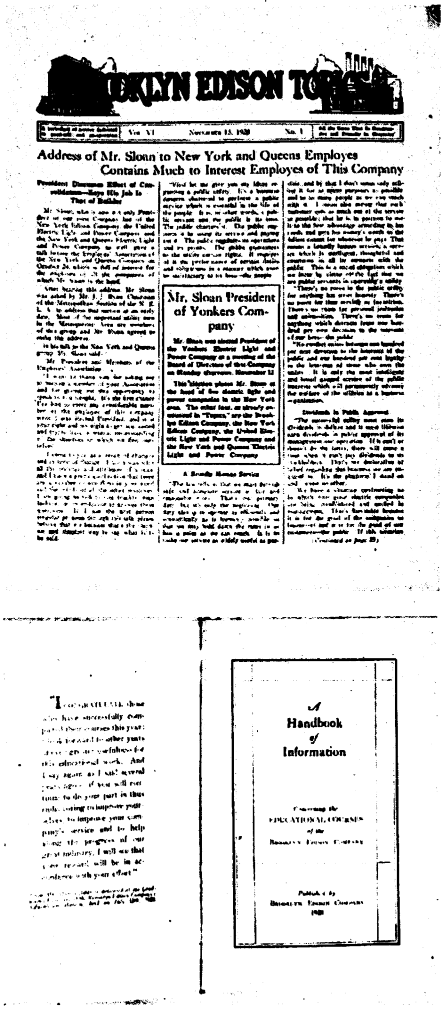
Let us consider some of the methods which have been successfully employed by operating companies in conveying such information to their customers.

Service and Policies of the Individual Company

The Indirect Method:

Perhaps the most important and productive method of informing customers indirectly of our service and policies is through the education of our employees so they will be willing and able to impart their knowledge intelligently and accurately to the customers with whom they come in contact.

Many of the companies have very complete courses covering the various phases of their business and organization. For example, in the Brooklyn Edison Company last year, there were 2153 course completions in 45 subjects. The average yearly course completions for the last five years were 1700. Some employees take more than one course each year. Over a period of years some employees take courses which practically cover every phase of company work. It can be readily seen that such an educational program produces a growing group of intelligent and well informed employees.



BROOKLYN EDISON TOPICS

Address of Mr. Sloan to New York and Queens Employes Contains Much to Interest Employes of This Company

Mr. Sloan President of Yonkers Company

A Handbook of Information

Methods of informing customers through intelligent employees. The Monthly Magazine tells what the Company and its employees are doing. The booklet describes the educational courses of the Company offered to all employees.

Other methods of educating employees which have produced worth while results are departmental meetings addressed by department heads and executives and meetings of smaller groups headed by members of the supervisory force. Group conferences are also widely used. Under the group conference plan employees doing a certain line of work are brought together and a conference leader who has prepared material to stimulate discussion on various features of the particular job leads discussions within the group. All of these plans have merit if properly organized.

House organs and periodic pamphlets issued to employees describing employee happenings and company activities are also helpful for their supplemental educational value.

An open house for newspaper reporters, permitting them to observe company employees and company activities, is a fertile source of news stories which usually reflect friendliness to the public.

The Direct Method:

There are many direct methods of informing our customers regarding fea-

tures of service and company policies. Some companies have found illustrated lectures and motion pictures most valuable.

Personally conducted visits of customers to company plants is a plan followed by many companies. In the case of the Brooklyn Edison Company, 10,000 people have been conducted through its Hudson Avenue Generating Station in the last two years. During an "Open House Week" held by a midwestern company over 27,000 visitors were shown through its various plants.

Bill inclosures are a direct and very effective means of carrying information to customers.

an important medium for disseminating company information.

Ideals of the Individual Company and Its Relation to Civic Betterment or Community Growth

Many companies encourage their local representatives to join the local civic organizations and clubs and to take an active part in their work. This gives an excellent opportunity for these representatives to keep such organizations informed.

Participation of company representatives in the campaigns of approved charitable organizations, membership drives of the chamber of commerce, and other similar activities is a link in civic betterment which many companies weld. The use of company bill boards or company show windows to further the work of these organizations is frequently offered.

Joining in and supporting such activities as safety and resuscitation, accident prevention, boy scout movements, and in general backing all worthy civic projects offers further means of informing the public as to our ideals and the place we hold in the community.

Utility companies have an obligation to the community in which they operate and should give loyal support to all of their worthy projects.

The display of placards in the offices where our customers visit, telling of our ideals and friendliness, is also effective.

Bill inclosures may also be used to good advantage for this purpose.

Proper Use of Appliances and Equipment

Perhaps the home economics work being carried on by the majority of companies is the most desirable medium for informing our customers regarding the proper use of appliances.

Lighting exhibitions, model homes, electric sign shows, electric shows, with their many variations can be used to inform customers how to obtain better use of the service supplied.

The Brooklyn Edison Company has taken advantage of the proximity of the Lighting Institute of the Edison Lamp Works at Harrison, N. J., to transport in buses hundreds of its merchants and others to observe the display and hear the lectures on proper lighting.

Lighting talks by the illuminating engineers of the various companies, model show windows, etc., are primarily, of course, sales activities, but nevertheless are educational.

Peoples Light Company

A UNITED LIGHT PROPERTY

ONE evening, a few weeks ago, two men entered adjoining telephone booths in a drug store at Coney Island.

Almost simultaneously, they called the same number—Triangle 6000.

"That's strange," thought the first man, and having finished his conversation, waited for the other to emerge.

"Excuse me," he said, "but I heard you call the Brooklyn Edison Company. Are you in trouble, too?"

"Not a bit," came the answer, "but I'll be glad to help you, if I can. I happen to work for the Company."

Our man soon had the other's story—how the lights in his home had suddenly gone out, leaving a puzzled husband, wife and new baby very much in the dark.

"My car is just outside," said our man. "Let me drive you home and see what we can do about it."

Five minutes later everything was O. K. again.

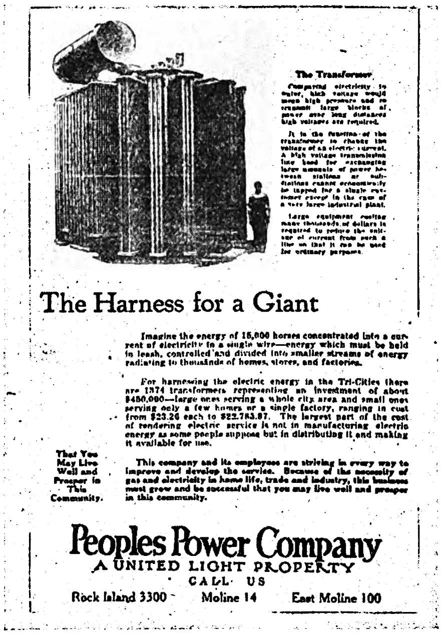
Brooklyn E

Newspaper advertising and bill enclosures which feature the employees and their desire to render real service to customers



The Transformer

Comparing electricity to water, high voltage would mean high pressure and to transmit large blocks of power over long distances high voltages are required.

It is the function of the transformer to change the voltage of an electric current. A high voltage transmission line used for exchanging large amounts of power between stations or substations cannot economically be tapped for a single customer except in the case of a very large industrial plant.

Large equipment costing many thousands of dollars is required to reduce the voltage of current from such a line so that it can be used for ordinary purposes.

The Harness for a Giant

Imagine the energy of 16,000 horses concentrated into a current of electricity in a single wire—energy which must be held in leash, controlled and divided into smaller streams of energy radiating to thousands of homes, stores, and factories.

For harnessing the electric energy in the Tri-Cities there are 1374 transformers representing an investment of about $480,000—large ones serving a whole city area and small ones serving only a few homes or a single factory, ranging in cost from $23.26 each to $22,783.87. The largest part of the cost of rendering electric service is not in manufacturing electric energy as some people suppose but in distributing it and making it available for use.

That You May Live Well and Prosper in This Community.

This company and its employees are striving in every way to improve and develop the service. Because of the necessity of gas and electricity in home life, trade and industry, this business must grow and be successful that you may live well and prosper in this community.

and Electric Company in financing and installing an eight mile highway lighting demonstration in a rural community with the avowed intention of demonstrating the assets of adequate lighting on public highways, created a renewed spirit of friendship for the company and added many customers to its lines.

Several companies instruct customers in the proper use of fuses, in some cases mailing customers several fuses with a leaflet showing how to install them. No charge is made for these fuses.

The investigation of radio interference for customers is also valuable from an educational as well as good-will standpoint.

Electrical Industry in General

Individual companies and state utility information organizations are taking advantage of the demand from civic associations and clubs for speakers on educational subjects. Experience has proved that speakers on subjects pertaining to the electrical industry are always welcome at such meetings.

It is true also in the schools, particularly in the junior high schools, which frequently request speakers from the local companies to give elementary information regarding the business of the electrical industry. Many repeat requests are received, particularly where the talks are illustrated by motion pictures or lantern slides. These talks are highly educational and are often woven in with utility subjects treated by courses offered in the schools.

Copies of speeches by executives regarding our business are sent to all customers by some of the companies, either as bill inclosures or under separate cover.

Exhibits depicting the growth or development of the industry always command a large and interested attendance of customers. At these exhibitions an opportunity is afforded to display to the visiting public, literature which is supplementary to the educational value of the exhibit itself. The Rochester Gas and Electric Company reports that last year over 150,000 people visited the company's exhibit at the Rochester Industrial Exposition and viewed its interesting historical exhibit portraying and comparing the old-fashioned and the modern home with the contrasting evidence of oil lights with electric lights, wash tubs with electric washers, gas or electric range with the old coal range, and other ex-

hibits which contrast the modern conveniences with the old makeshifts.

Interesting Educational Material

It is unfortunate that the amount of space that can be allotted to a Service Suggestion precludes presenting all of the valuable and interesting educational material which is being used by the various companies in giving information to their customers.

The photograph of a pamphlet may give some idea of the outside appearance of it but does not permit the reader to see the contents nor the great effort and fine ideals which the individual company has woven into its production. Neither can photographs accurately illustrate the attractiveness which goes a long way toward creating an appeal to read such literature.

The educational material illustrated has been grouped, as nearly as possible, into the four classifications above described. Space permits the illustrating of only a few of the many excellent examples collected. If samples of literature shown or any other information regarding methods mentioned in this Service Suggestion are desired, the Customer Relations Committee will endeavor to obtain them from the individual companies.

Many methods of informing customers about our business are available to modern utility companies and efforts to create a better understanding between company and public through their use cannot fail to aid in the improvement of our public relations.

The Customer Relations Committee is equipped to make studies of ideas, practices, and policies which have a bearing upon the relationship which exists between light and power companies and their customers and will be glad to collect data and furnish suggestions upon any phase of company operation which falls within the scope of its functions. Requests for information or assistance may be addressed directly to the Chairman.—H. T. EAST, *Chairman*, c/o Public Service Co. of Northern Illinois, Chicago, Ill.

Federal Electric Company

AWARD

of

$1,000 and Gold Medal

for

the Greatest Contribution

to

ELECTRICAL ADVERTISING

* * *

The Award is to be made annually to the member company of the National Electric Light Association that contributes most to the advancement of the electrical advertising industry each year. This contribution may be in the form of:

(a) A new use for electrical advertising;
or (b) An identification program, such as has been inaugurated by certain holding companies;
or (c) An enterprise whereby businesses throughout the country, or in a particular community, are brought to a keener realization of the value of electrical advertising;
or (d) An activity which makes possible better merchandising or electrical advertising displays.

The Award

The Award is a Gold Medal to the company making the greatest contribution to electrical advertising during the period of the contest year, and $1,000.00 to the individual in that company responsible for the achievement.

The Period of the Contest

The first contest year will be retroactive and will include the twelve months period ending February 28, 1929.

Exhibits must be filed at N. E. L. A. Headquarters on or before April 15, 1929.

Announcement of the winner will be made at the annual N. E. L. A. Convention.

Registration blanks may be secured from C. E. Greenwood, Commercial Director, N. E. L. A., 420 Lexington Ave., New York, N. Y.

ENGINEERING SECTION

E. C. Stone, *Chairman* H. S. Bennion, *Director of Engineering, N. E. L. A.*

Prime Movers Committee Meeting

By Edwin B. Ricketts, *Chairman*

An exceptionally well attended meeting of the Prime Movers Committee was held in Buffalo, N. Y., on Nov. 12 and 13. There were 41 Counsellors, Officers and Members-at-Large, 4 representatives of Geographic Divisions and 6 guests.

Boiler and Turbine Room Instrument Subcommittee

The final report of the Boiler and Turbine Room Instrument Subcommittee was submitted by Mr. Frost, who outlined the contents of the report and called attention to the increased satisfactoriness of instruments as compared with ten years ago, although likewise emphasizing the necessity for continued improvement not only in the instruments themselves but in the care and accuracy of their installation and use.

Burning Liquid and Gaseous Fuels Subcommittee

The report of the subcommittee on Burning Liquid and Gaseous Fuels contained considerable information on methods of measuring gas for boiler purposes and also many data from various plants showing the heat liberation in various water cooled furnaces when used with oil or gas as fuel. Apparently in a great many installations water cooled furnace walls accumulate a thin coating of ash and are thus somewhat insulated from the intense heat in the furnace. This does not occur with gas or oil fires and some experience indicates that it may be necessary to design water cooled walls for lesser rates of heat transfer than has been the case in the past.

Coal and Ash Handling Subcommittee

Mr. Hurst in presenting the report of the Coal and Ash Handling Subcommittee, called attention to most prominent questions at the present time in connection with pulverized fuel. One is the arrangement for tapping ash from bottom of furnaces in the molten form and the other is experiments being performed to determine the best method of collecting the fly ash from pulverized coal furnaces. The committee will continue this investigation for next year, although considerable data was included in this year's report on these two subjects.

Distillation Products of Coal Subcommittee

An extensive report on the subject of Distillation Products of Coal was submitted by Mr. Lawrence, chairman of this subcommittee. The conclusion seemed to be that most of the past year's activities were by way of improving upon plants and methods already in experimental operation and in further analyzing the economics involved. It seems that particular attention should be paid to the market value of the principal by-products since it usually is necessary to obtain an appreciable return from these by-products before the process as a whole can be justified from a dollars and cents standpoint.

Operating Code Manual Subcommittee

Mr. Thompson submitted final report of the Operating Code Manual Subcommittee, in which the various codes previously published were edited and brought together in standardized form.

When published this complete report will make a very comprehensive and satisfactory handbook for operating companies to use either by way of educating their operators or as basis for the production of operating codes of their own as applied to their particular stations. The matter in this report has been very carefully worked out from the results of several operating companies and represents the best modern practice.

Feed Water

Treatment of Feed Water was covered in a report presented by Mr. Irwin, in which it was shown that about half of the 35 central station plants reporting use evaporators, 7 use chemical treatment, 7 use raw water and 2 use Zeolite softeners. Several companies find it necessary to add sodium phosphate to the distillate from evaporators in order to counteract the small amount of solids carried over with the vapor from the evaporators. There was considerable discussion of caustic embrittlement and another committee member reported trouble recently from this cause where a very pure feed water had been used which, however, showed an excess of carbonate over sulphate content beyond the usually accepted standard ratio of 1 to 3. Considerable discussion on this subject developed the fact that so far no trouble has been known to develop in which the sulphate-carbonate ratio was kept at 3 or more.

Boilers, Superheaters and Economizers

Preliminary reports were submitted by Mr. Alden on Boilers, Superheaters and Economizers. Considerable discussion developed on the question of water cooled furnaces, the rate of heat transfer and width of fins on the fin type walls. Likewise, the question of arrangement and degree of circulation for water walls was discussed at length. Apparently different companies are having satisfactory results with widely different circulation arrangements, some using recirculating tubes and others no recirculating tubes, but with liberal pipe connections to and from the water walls.

Condenser Subcommittee

Mr. Bell made preliminary report for the Condenser Subcommittee and asked for data on heat transfer, particularly for single pass condensers.

Foreign Developments Subcommittee

Professor Christie, chairman of the Foreign Developments Subcommittee, was absent on account of illness, but reported by letter, stating that reports were expected from foreign correspondents and that the final report would be ready for the February meeting.

Specifications Subcommittee

Mr. Iddles presented preliminary report of Specifications Subcommittee, in which standardized specifications for air preheaters, closed heaters and deaerating equipment are included. These specifications are drafted along the line of previous reports of this subcommittee and this year's report completes specifications for all major items of mechanical power plant equipment.

In addition, this subcommittee's report includes an extensive bibliography of specifications of other standardizing bodies covering all kinds of material and equipment used in power plants. The bibliography is arranged by numbers according to the source of the standards and alphabetically according to subjects. References are particularly made to publications of the American Society of Testing Materials, American Standards Association, Federal Specification Board, American Society of Mechanical Engineers, Bureau of Standards and Bureau of Mines.

This bibliography is intended to bring under one cover references to all manner and types of specifications which from time to time are referred to by power plant engineers when writing specifications for specific requirements.

The preliminary report of this committee was substantially complete and it was suggested that the report be finished by addition of the necessary introduction and submitted as a final report prior to the February meeting.

Induced Draft Fan Performance

Round table discussion on Tuesday covered the subject of induced draft fan performance in which recent apparent failures of fans to perform in accordance with manufacturers' guarantees had been claimed by the manufacturer to be due to supersaturated water vapor in the flue gases which condensed in the first Orsat tube and thus caused a better CO_2 reading than actually existed. The manufacturer claimed that this might reduce CO_2 from 10 to 8 and thereby materially increase the quantity of excess air and therefore the calculated quantity of flue gases being handled by the fan.

It was the opinion of the majority attending the meeting that the manufacturer was endeavoring to take advantage of a highly theoretical point to cover improper fan design.

There was some discussion on protection against fires in turbine rooms, particularly from broken or leaking oil pipes around turbines.

Recent developments in feed water regulators were discussed and several members reported satisfactory use of differential pressure regulators installed immediately ahead of the regular feed water regulator.

Pulverized Fuel Installation

Mr. E. G. Bailey, president of Fuller Lehigh Company, upon invitation of the committee, made an address outlining the development of the pulverized fuel installation in the Huntley Station of the Buffalo General Electric Company. This plant was visited in the afternoon by the entire committee and Mr. Bailey outlined the development of the well type furnace with tangential and with opposed firing. This plant is a standby and peak load plant and it therefore was desirable to obtain rapid steaming characteristics with maximum production per unit of space occupied. The result is a water cooled furnace of the well type with direct firing from large pulverizers operating on the unit system. The latest development is tapping of molten ash from the base of the furnace and discharge into a hydraulic sluice so arranged that the ash is broken up into small pieces and thence pumped through pipe line to adjacent fill.

The committee enjoyed a very satisfactorily arranged inspection trip to the Huntley Station and adjourned to meet on Feb. 4 and 5 in Pittsburgh.

Overhead Systems Committee Meeting

By **Harold Cole**, *Chairman*

THE Philadelphia meeting of the Overhead System Committee held Oct. 8-9 was attended by a large group of members, geographic division representatives and interested visitors which at times taxed the capacity of the large meeting room provided. There were 43 members-at-large, 7 geographic division representatives and about 50 vsitors registered during the two days of the meetings.

Committee Reorganization

Since the last meeting of the committee a plan of reorganization had been worked out by the newly formed Executive Committee which had held two meetings for the purpose. The Chairman outlined the new plan which provides for four major standing committees the scope of whose work practically covers the field of activities of the Overhead Systems Committee. Special subcommittees are being formed to study particular problems under each of these Committee Chairmen. The four standing committees and their chairmen are:

Transmission Lines Committee, Sydney Alling, Chairman.
Distribution Lines Committee, T. H. Haines, Chairman.
Materials and Equipment Committee, B. J. Barmack, Chairman.
Safety Rules Committee, E. J. Amberg, Chairman.

Each standing committee chairman described the organization of his committee and the subjects of special interest which were to be studied by its subcommittees.

The Chairmen of the standing committees, together with a number of the older and most active members of the main committee now form an Executive Committee, the purpose of which is to assist the Chairman in deciding upon matters of policy, to relieve the main committee of detailed consideration of reports and other routine matters, and in general to act as a steering committee to the main committee.

Zinc Meta-Arsenite Treatment of Wood Poles

A very interesting and instructive talk on the above subject was given by Mr. P. J. Howe, of the Western Union Telegraph Company and the Curtin-Howe Corporation. This new method of pole treatment has been developed by the Western Union Telegraph Company and is expected to replace to large extent the creosote treatment. It is less expensive, more permanent in its effect and leaves no surface deposits of excess preservative. Zinc Meta-Arsenite is a compound of arsenic and zinc which is very insoluble except in acids. It is dissolved in water by the use of acetic acid. The acid evaporates and leaves the insoluble zinc meta-arsenite in the wood. The preservative is also immune from leaching. It is applied by the pressure method to the full length pole, a cold solution being used. The Western Union has adopted zinc meta-arsenite treatment for all pine poles and pine cross arms.

Other advantages of this treatment are—poles can be painted after treatment, tnere are no ill effects to the face or hands of men handling the poles, the penetration of the treatment is greater than with creosote, it is apparently effective against termites or other insects, it does not increase the conductivity of the pole. The fact that the zinc meta-arsenite used for this treatment is a poison is not regarded as serious by Mr. Howe because it is not soluble in water and it would therefore be necessary to actually swallow some of the salt and have it acted upon by the acids of the stomach to make it effective.

Overhead Distribution Networks

Mr. M. T. Crawford of the Puget Sound Power and Light Company prepared a paper which was presented in his absence by Mr. T. A. Purton. The paper described a very novel and interesting development in distribution system design brought about largely by local conditions in Seattle. Due to competition with a city owned utility water-pipe grounds are prohibited. The alternative adopted was to tie all transformer secondaries in any one circuit together to form a network. The secondary neutral wires were also used as the neutral wires of the 2300/4000 volt primary system and the primary mains were connected in a network. The network is restricted to the area fed by one phase of a primary feeder. All of the transformers in this area are therefore connected across common primary and secondary mains. The common neutral is grounded at each transformer but a heavy neutral feeder is carried back to the substation from various points in the neutral grid over the same route as the three phase wires.

Advantages claimed for this system are:

Economy—The common primary and and secondary neutral makes it necessary to use only four wires instead of five in the network area; the network system makes maximum use of the diversity factor between various services; the system adapts itself readily to growth as it is only necessary to install a new transformer, to handle increased loads, no changes in primary or secondary copper being necessary.

Better voltage regulation—Secondary voltage drops are small as are also drops in the primary grid and by the use of single phase regulators and careful adjustment of compensators a maximum range of 5 volts variation is possible.

Better continuity of service—It has been found that by using No. 4 secondary mains throughout, a fault in the transformer or the secondary grid will not cause the entire grid to "cascade" but will only blow fuses on a few transformers producing a low voltage but not an entire interruption of service. The ability to burn off primary faults is a result of the networking of the primary mains. In 158 cases of primary short circuit during 1927, 152 burned clear.

No complaint of interference with telephone service which could not be remedied has resulted from the use of this system.

220 Kv. Construction and Operation

Mr. W. W. Woodruff of the Philadelphia Electric Company presented a timely paper which described the 220 Kv. transmission system now being constructed in the vicinity of Philadelphia to transmit power from the Conowingo Development on the Susquehanna River to Philadelphia and to interconnect the three large systems in the vicinity, namely, the Philadelphia Electric Company, the Pennsylvania Power and Light Company and the Public Service Electric and Gas Company of New Jersey. In this paper Mr. Woodruff brought out the development of design as experience was gained from the operation of the initial lines.

The first 220 Kv. line to be put into operation in the East was the Wallenpaupack-Siegfried Line of the Pennsylvania Power and Light Company which was placed in operation in 1926. This line was built without ground wires, using 14 units of insulators. The results were not entirely satisfactory as the line tripped out during lightning storms as a result of direct strokes on the line, although it was apparently immune from flashover due to induced strokes. Experimental installations of ground wires indicated that they were of considerable value in reducing the number of flashovers. Recent construction of 220 Kv. lines in this vicinity has included two ground wires over each circuit. All lines built in the East have been of single circuit construction with the wires in a horizontal plane. Ground wires are located midway between and above the line conductors.

During the 1928 lightning season the two Conowingo-Plymouth Meeting lines, which are on the same right-of-way 170 feet apart, experienced three trip-outs due to lightning, although the season was a severe one, 34 storms passing over the lines. Both lines were not affected at the same time. These lines comprise 115 circuit miles.

Mr. Woodruff draws the following conclusions from the experience of the last few years:

> Flashovers on 220 Kv. lines, insulated with 14 or more units, are due to direct strokes of lightning.
>
> By the use of ground wires and high line insulation, many direct strokes may be experienced without flashover.
>
> The use of grading shields may be helpful in reducing damage to insulator strings, but they are apparently not essential.

Transmission Line Insulation as a Source of Radio Interference

It has been found that serious interference to radio reception has been caused in some instances by high voltage transmission lines. The most serious cases have been experienced where 66 Kv. lines have been carried on pin type insulators. Apparently very little trouble has been caused by lines equipped with suspension insulators or by lines of less than 44 Kv. where insulators of a rating higher than the line voltage are used.

A discussion of this problem was led by Mr. M. D. Hooven, Chairman of the Radio Interference Subcommittee of the Inductive Coordination Committee. The experience of several operating companies was related. It was brought out that the trouble was caused by a discharge from the line and tie wires to the insulator. The cure for it is apparently to decrease the contact resistance at this point and insulators have been developed with a metallic coating in the line and tie wire grooves which give entirely satisfactory operation. The installation of these insulators at the point of interference, however, is ineffective as the line acts as a carrier to carry the disturbance caused by insulators in other sections of the line. Efforts to find a method of applying a cure to existing installations have not been very successful in most cases. Some relief has been obtained by placing a stove-pipe ring over the insulator and in contact with the line. It was reported that the Bureau of Standards had developed an aluminum paint which would retain its conducting properties indefinitely. If this is so, it should offer a fairly satisfactory solution.

The representatives of insulator manufacturers were invited to attend the session at which this problem was discussed and it is felt that the opportunity to interchange ideas was of great mutual benefit.

Reports

A Report was presented by Mr. T. H. Haines on "The Patrol and Inspection of Transmission Lines" which had previously been sent to the Committee membership. This report gives the practice of various member companies. It will be submitted as a serial report.

The Great Lakes Division Committee prepared a report on the "Operation of High Tension Transmission Lines during 1927" in their division which was submitted to the National Committee at the request of the Chairman. Mr. W. J. Ducey gave a synopsis of the report which will also be submitted as a serial report.

Rubber Gloves

Mr. K. R. MacKinnon, Chairman of a Special Committee on Rubber Gloves sought the advice of the Overhead Systems Committee as to the desirability of developing a rubber glove for use on voltages above 3000 volts. Gloves made under the present A.S.T.M. specifications are not intended for use above that voltage, although many companies are using them on 6600 volts and above. Mr. MacKinnon's committee proposes to ask the A.S.T.M. to develop a specification for a glove to be used on working voltages up to 8000 volts. The Overhead Systems Committee approved the Rubber Glove Committee's selection of 8000 volts as the proper upper limit for a new glove. They also agreed that the new glove should be somewhat longer than the present 3000 volt glove. It was brought out that gloves with curved fingers and which would more closely fit the hand would be possible in the near future. The Overhead Systems Committee members did not wish to commit themselves as to the desirability of making these features a requirement of the new specification. There was also considerable discussion of the desirability of rubber sleeves to protect the lineman's elbow.

Standardization

In a discussion of the various standardization projects which are under procedure of the American Engineering Standards Committee, it was brought out that members of the industry were being seriously inconvenienced by the slowness of action of the committees. This applies particularly to wood pole and weather-proof wire specifications. The Overhead Systems Committee at various times in the past has issued suggested specifications for wood poles which were widely used by member companies. Some of these are now out of print and also in need of revision. Specifications for pine poles were prepared several years ago but never issued because of the A.E.S.C. project. There was some expression of a feeling that the Overhead Systems Committee should not wait for the A.E.S.C. procedure but should make up suggested specifications for the use of member companies when they were requested.

The situation with respect to weather-proof wire is that the Overhead Systems Committee representative is holding out for certain provisions to which the other members of the A.E.S. Committee refuse to accede. The stand of Mr. W. G. Kelley, the N.E.L.A. representative on the A.E.S.C. sectional committee was approved by the Overhead Systems Committee and the Chairman was asked to take up with the Executive Committee of the Engineering National Section the question of the propriety of issuing a suggested specification prepared by the Overhead Systems Committee.

General

Other discussion included the whipping and vibration of conductors and the use of special insulators under fog conditions.

Most of the members of the Committee availed themselves of the opportunity to visit the Conowingo Plant and Plymouth Meeting Substation.

COMMERCIAL SECTION

Marshall E. Sampsell, *Chairman* C. E. Greenwood, *Commercial Director, N. E. L. A.*

Work of the Electric Water Heating Committee

By Norman T. Wilcox, *Chairman*

That domestic electric water heating has not been developed to anything like its economic possibilities seems quite evident.

That the Electric Water Heating Committee of the Commercial National Section of N. E. L. A. is now considering the economic and practical possibilities of developing this fruitful source of revenue is evidence of the necessity of defining the possibilities from the standpoint of an economic service. Variant conditions, such as climate, character of water supply, investment required by both service company and customer, nature and size of demand, time that the demand occurs, as well as character of heater used, all have a direct bearing. Systems of water heating that may be successful in one section of the country may not be best adopted to another region. The low wattage automatic storage heater, when time of use is automatically and definitely controlled, brings very little added investment or maintenance for the service company. On the other hand, these limitations result in more or less addition to the investment required on the part of the customer.

If larger heaters are used, say 3 to 5 kw. capacity, and there are no limitations as to time of use, the utility must at least pay for and maintain a larger transformer and distribution investment. In this case, no doubt, with a large number of installations, owing to diversity in the time of use, the after diversity demand at the *generating station* may be only a small fraction of the demand at the point of use. A 5 kw. heater may be justified at least for a time if lines or equipment cannot be used in any other gainful way. This is especially true in the early years of operation of a large water power plant.

Farm lines with a low customer density per mile of line and large capacity requirements for other uses may admit the use of comparatively large heater elements and demand without a proportional increase of investment at the *generating station*, but this condition might not exist at other points where customer density might make a low wattage off peak heater more economic.

The dollars both for investment and for service that definite percentages of customers can be persuaded to pay for a satisfying service is a fundamental condition, which must also be known before we can entirely decide as to the lowest kw-hr. rate to be charged for a supplemental service such as water heating.

Our committee is comprised of a membership from various sections of the country and is collaborating with the most experienced manufacturers of electric water heaters. Committee work will be supplemented by comparative field tests already made as well as to be made by companies in various parts of the country. These test data are to be checked by the engineering staff at N. E. L. A. headquarters. The committee hopes to place such definite information in the hands of member companies as to water heating practice both at home and abroad as will be of definite assistance to member companies in the determination of sales policies and rates, such as may be expected to prove of profit to customers and service company alike.

Such a report, we believe, is needed

and will be of great assistance to the manufacturers as well as to utility managements in their effort for greater service to the public as well as profit to themselves and other interests concerned.

We hope to complete the body of the report for the 1929 convention, although this may later be followed by a supplement covering such field tests and data as will not be immediately available. The collection of necessary data is already well under way and all interests are working together with the definite aim of producing a report such as will be of definite assistance to all concerned.

COMPANY SECTIONS

Metropolitan New York Section N. E. L. A. Meeting

APPROXIMATELY 3000 people attended the Dec. 14 meeting of the Metropolitan New York Section, N. E. L. A., held in the ballroom of the Waldorf-Astoria Hotel. The principal address was by M. S. Sloan and is printed elsewhere in this issue.

Mr. Sloan was presented by J. J. Ryan, assistant general superintendent, Bronx, of the New York Edison Company, who as chairman of the Metropolitan New York Section opened the meeting with a report on the scope of the Section and the activities of its numerous committees.

Mr. Ryan, reviewing the work and history of the Metropolitan Section, said in part:

"The Metropolitan New York Section has been in existence as a Section for 17 years. It has, during all this time, done a real effective job in carrying through with its purposes, which are to further the interests of the industry and the public which it serves. The Section has been particularly fortunate at all times in the kind and calibre of men it has had for Section chairmen, officers and committee workers, and they have all carried on faithfully and well, and merit the credit that should go with a job well done.

"Our organization scheme is extremely simple. Membership, for the most part, comes from the various utility companies operating within the Metropolitan Zone, namely, the Bronx Gas & Electric Company, the Brooklyn Edison Company, the New York Edison Company, the Queens Electric Light & Power Company, Staten Island Edison Corporation, the United Electric Light & Power Company, Westchester Lighting Company, the Yonkers Electric Light & Power Company. Our Section members are also Class 'B' members of the national body. At present most of the work is carried on in three general divisions, designated as the Accounting Division, the Commercial Division, and the Engineering Division. In each of these divisions there are a number of working committees made up to follow through on what are natural and logical subdivisions of the utility business. There are representatives on these various committees from every company. These representatives serve with the approval of their respective company department heads and executives. Meeting of these committees are held once a month, from October to May. At these meetings problems, practices and routines covering the particular phase of the work in which the committee is engaged are discussed. The discussion is very free and open, and results in acquiring of knowledge, making contacts and a training among the men in the various companies engaged in the same class of work which could be obtained in no other way. Minutes of the meeting are kept and reports made. There is a distinct relation and tie between these committees and committees of the national association, so that there is little or no wasted effort. It is a fact, however, that in our Metropolitan New York Section there are local problems in which the national organization is not concerned.

"A so-called One Day Convention is held once a year to which all members are invited and at which an outline of the work done by the committee during the year is presented. Men prominent in the utility field or allied industries are invited to address the membership at this One Day Convention.

"A summary or digest of committee reports is made for the information and use of the executives and department heads of the various companies.

"Three or four general meetings are also held during the year, similar to the present one. All members are asked to attend. These serve the useful purpose, by the delivering of addresses by prominent men, of keeping our members up to date in the trend, progress and development of our industry.

"There are also some general committees such as the Educational Committee, Committee on Employee Associations, and the Women's Activities Committee, which are doing a splendid, effective work.

"For the year's work we are very well under way. All of the committees have held two or three meetings, and all report good attendance and interest.

"It may be of interest to note that there are 18 working committees with a membership of 460, and 12 general committees with a membership of 104, giving a total of 564 persons in active N. E. L. A. work This total will be considerably augmented within a short time by representatives from the Brooklyn Edison Company.

"Our membership is approximately 2800, made up of key or leading men in the various companies. This is less than one in every ten employees. It is our thought that the ratio should be much better. There is place and opportunity for more."

WOMEN'S COMMITTEE

Miss Sophia Malicki, *Chairman* Miss Isabell Davie, *Secretary*

News Letter

By Mrs. Thelma Van Ness

ACCORDING to "The Oklahoma Meter," the Women's Committee of the Oklahoma Gas & Electric Company was recently invited by the home service department to visit its new electric bungalow built on the basement floor of the new O. G. & E. Building in Oklahoma City. The building is furnished and equipped just as any home would be. It is designed to show the extent electricity does and can play in the ordinary role of keeping a household. There are embodied in it all the latest designs in furniture, wall paper and fixtures. An auditorium seating 100 people is next to the bungalow and is available to groups of women and women's clubs as a meeting place. A program of food demonstrations and household management will be conducted by the home service department under the direction of Ruth Van Sant, director of the department.

* * *

To quote from the Sixth Round Table of the Kansas Women's Committee: "They did it in Nebraska—at Omaha! Devoted part of one meeting every month to getting acquainted with their commercial department's current specialty. They waffled in January, toasted in February, perked in March and ironed in April. Clear round the calendar they went via the electric appliance route and when the year was over an attractive booklet was prepared by each girl telling the virtues of this and that appliance. Prizes were awarded the three best tales. Write Johanna Truax, Nebraska Power Company, at Omaha, for further information."

* * *

A very interesting booklet comes from the Women's Committee of the Pacific Coast Electrical Association, entitled "How the Women's Committee Promotes Good Will," which contains the prize winning papers in the essay contest on that subject. Mrs. Ruth E. Creveling, chairman, women's committee of the Pacific Coast Electrical Association, was one of the judges. Helen Cowan of the San Joaquin Light & Power Corporation won first prize; Ethel E. Brockelbank, Los Angeles Gas & Electric Corporation, took second place, and Helen Y. Bragg, San Diego Consolidated Gas & Electric Co., was the third prize winner. Honorable mention was given to Miss O. C. Koch, Coast Counties Gas & Electric Co.; Mrs. Marguerite E. Kerline, Los Angeles Gas & Electric Corporation, and Mrs. E. A. LaMour, San Joaquin Light & Power Corporation.

* * *

A recent issue of the Florida Power & Light Company magazine contains an excellent article on "Electricity in the

Home," by Mrs. Helen Holmes of the executive department. This is an address delivered by Mrs. Holmes at a meeting of architects of Greater Miami.

* * *

A remarkable report comes from Morganfield, Ky. With only fourteen girls in this district of the Kentucky Utilities Company, the minutes of a recent meeting show some forty guests. This meeting attracted the most prominent people of the city and nearby towns. Present were lawyers, bank officials, city officials, newspaper editors, the president of the Kiwanis Club and members of the Women's Club. The Parent-Teachers' Association of the Morganfield graded school acted as hostess to the committee. Mrs. Priscilla F. Korb is chairman of this small but active committee and her work should be a real inspiration to other girls faced with the difficulties of a small group.

* * *

At a recent meeting of the Women's Committee of the Illinois Northern Utilities Company at Dixon, each girl took a guest. The purpose of the meeting was to bring about an understanding of the work of the committee. Miss Edna J. Decker is the chairman. All of the Dixon girls were present and each responded to roll call with an item of interest about the company or the industry.

* * *

Miss Esther Rockey, chairman of the East Central Division, reports some exceptionally good meetings of the Women's Committee of her division at Cedar Point-on-Lake Erie recently. Mr. C. I. Weaver, president of the East Central Division, and Mr. P. S. Arkwright, president of the N. E. L. A., both addressed one of the meetings. A very unique feature of the convention was the lampshade class conducted by Miss Mary Webber of Nela Park, assisted by the women of the Ohio Public Service Company, with Mrs. Ella Smethers in charge. This class was open to all women in attendance at the convention. Another meeting included reports by the State chairmen and talks by Miss Eloise Davison, home economics director of the N. E. L. A.; Miss Gladys Applebee, consultant, Electric League of Cleveland, and also A. Bliss McCrum, secretary of the Public Utilities Association of West Virginia.

* * *

In order that all the girls of the Northwestern Public Service Company, Huron, S. D., may see the list of articles of interest to Women's Committee members, Vera Bauman publishes this list in her bulletin.

* * *

The August number of "Cipsco News" reports that the program of the Central Illinois Public Service Company's division C seventh annual safety picnic included the playlet "Never Say Die," the director of which was Mrs. Maude Miller.

* * *

From the far West comes a communication of real interest. Miss Mary K. Walsh, past chairman of the Women's Committee of the Northwest Division, reported the results of a public speaking contest and two essay contests. She quoted Mr. George L. Myers, chairman, Public Relations Section, that division who exclaimed, "Again the women win." The women won the public speaking contest. Mrs. Mabel Maxwell, Portland Electric Power Company, Portland, Ore., was the winner of the contest, the subject of which was "Government in Business." Under the title, "Employees as a Factor in Public Relations," Miss Louise Wilmot, Puget Sound Power & Light Company, won the prize. In the contest under the subject of "The Women's Role in Public Relations," Miss Lula A. Boyes, Utah Power & Light Company, was the winner in the Class A, women's employees, and Mrs. W. H. McMurray, Pacific Power & Light Company, Yakima, Wash., in the Class B, wives of employees. Mrs. Winifred Reed won second place in the women's committee essay contest. Mrs. Reed is affiliated with the Washington Water Power Company, Spokane, Wash. Miss Fern Wheeler took third prize in this contest. She is with the Puget Sound Power & Light Company at Bellingham, Wash.

And here's another item from this very active group. The Women's Committee first aid team of the Portland Electric Power Company put on demonstrations every evening at a recent Electrical Exposition held by the Portland *Telegram*, one of the leading newspapers of Portland.

* * *

The chairman of the Women's Committee of the Kentucky Utilities Company, and also State chairman, Mrs. Beulah K. Yewell, believes in very complete and interesting reports of her meetings, including newspaper clippings, printed programs, and the actual minutes. Some fifty girls of the Kentucky Utilities Company recently held one of their "three-a-year" meetings at the Danville Country Club at Danville, Ky. Mrs. Henry Jackson, of Danville, chairman of the American home department, Kentucky Federation of Women's Clubs, gave the address, and Miss Helen G. McKinlay, Edison Lamp Works of General Electric Company, Harrison, N. J., talked on "Decorative Lighting for the Home." Others on the program were Mrs. Menna L. Jennings, of Paducah; Mrs. Priscilla F. Korb, of Madisonville; Mrs. Hattie A. Wood, Fulton; Mrs. Christine S. Smith, Morganfield; Miss Loretta Shine, Cynthiana; Miss Maxine V. Hydron, Louisville; Miss Velma G. Wilkerson, Franklin; Mrs. Nancy W. Burton, Louisville, and Mrs. Nellie D. Steenbergen, Paris Ky.

* * *

According to the Seventh Round Table of the Kansas Women's Committee, lamp campaigns are playing an important part in committee work in that locality. Grace Mitchell of the Kansas Power Company says they're breaking world's records in their campaign and the Kansas Gas & Electric Women's Committee is another group very much concerned with the "Fill the Empty Sockets" campaign.

* * *

Another Women's Committee number of a company magazine has appeared. "Power News," published in Indianapolis for the Indiana Gas Light Company, Indiana Electric Corporation, Attica Electric Company, Wabash Valley Electric Company, Northern Indiana Power Company, and the Mulberry Light & Power Company, is a clever publication full of interesting articles by the girls of these companies.

RELATED and other ORGANIZATIONS

Conference of Representatives of State Public Utility Information Bureaus

A MEETING of chairmen or representatives of state public utility information bureaus was held at the Electric Club, 30 North Dearborn Street, Chicago, the afternoon of Wednesday, Nov. 14. The meeting was called and was presided over by Mr. T. A. Kenney, Chairman of the Information Bureaus Committee. Eight bureaus had no representatives present, but were indirectly represented by representatives of holding, financing or management companies with which the major operating companies in those states are affiliated. It was the unanimous belief of the conference that the work being carried on by the bureaus should be intensified, that the bureaus should be given every possible support, and that the executives of the operating companies should give their personal attention to the conduct of the affairs of the bureaus.

Chairman Kenney, in opening the meeting, told briefly of the meeting of directors of the bureaus and of public relations men of holding and operating companies at Grand Beach, Mich., in August. He then called upon Mr. B. J. Mullaney for an address on the genesis and development of the information bureau movement. Subsequently he called upon chairmen, or representatives, of a large number of bureaus so that a general geographic picture of the sentiment regarding the work might be had by those present.

A feature of the meeting was a brief address by E. N. Hurley, former chairman of the U. S. Shipping Board and prior to that a member and chairman of the Federal Trade Commission. He spoke of the present investigation of the electric and gas utility industries before the Federal Trade Commission and emphatically denounced the attitude of the Commission, particularly with respect to its "fishing expedition" proclivities. He declared it as his opinion that the Commission is without legal authority to so conduct itself and that its activities in this respect at least are unconstitutional. He related an instance of similar activities on the part of an investigator for the Commission when he was chairman, which resulted in the immediate withdrawal of the investigator and a dismissal of the charges aganist the concern being investigated.

B. F. Weadock, special counsel for the Joint Committee of National Utility

Associations in the investigation before the Federal Trade Commission told briefly of the conduct of the investigation and plans for the presentation of the utilities' side of the case. Mr. Weadock was of the opinion that valuable as the work of the information bureaus had been to the industry in the past, it would prove to be of even greater value now and in future.

Mr. W. H. Hodge, a member of the special supervisory Publicity Committee of the Joint Committee of National Utility Associations, explained the purpose and functions of that committee and urged that the several state public utility information bureaus be utilized in presenting the true facts regarding the Federal Trade Commission investigation to the public.

Mr. W. W. Freeman declared that he is more than ever impressed with the value of the work of the bureaus, with which he has been in close contact in Ohio, and promised continued support by the companies he represented.

Mr. B. C. Cobb complimented the chairmen and representatives present on the excellent work which has been done even under the fire of the adverse criticism as a result of the Federal Trade Commission investigation. He heartily recommended continuance of the work, pledging his support.

Mr. W. A. Jones stated that in his opinion the work of the bureaus in future will be divided into two major parts: one informative work in presenting facts regarding the utility industry, and the other defensive work answering unjust criticism or attacks brought about through misrepresentation of facts adduced before the Commission or through the public press. He urged a definite program of aggressive defense, declaring that every unfair or unwarranted attack upon the industry through the press or otherwise should be answered. All Doherty companies, he said, will actively support the work.

Mr. C. E. Groesbeck announced that he, personally, is decidedly in favor of continuing the work of the bureaus and pledged the active and financial support of his company to the bureaus in those states where companies affiliated with the Electric Bond & Share Company are furnishing service.

Mr. George N. Tidd heartily concurred in the expressions of representatives of other holding, financial and managerial companies and reiterated the expression of others that the work of conducting the bureaus cannot be delegated but must be carried on by the executives of operating companies.

Mr. Britton I. Budd urged that a committee be appointed by Chairman Kenney to survey the work of the individual information bureaus with a view to making definite suggestions in each case, where necessary, as to ways and means of strengthening the work of the bureaus.

Mr. J. F. Owens addressed the meeting as Chairman of the Public Relations National Section of the N. E. L. A. He urged active and aggressive continuation of the work and thanked Chairman Kenney for his unselfish and untiring work as chairman of the committee, and indorsed the idea of having a committee appointed in line with Mr. Budd's suggestion.

At the request of Chairman Kenney, Mr. George F. Oxley spoke regarding the current work of the bureaus as a whole. He urged that executives on the committees take over some of the work which is now delegated to directors in many cases, particularly that relating to the financing of the bureau work. He urged that each bureau appoint some executive to be responsible for the financial support, thus relieving the directors of the necessity of constantly "selling" themselves and their work to the executives and soliciting funds for the support of the work.

Discussion of the bureau work and reports as to the opinion of company executives in their respective states regarding the continuance of the work were made by the following, who were called upon by Chairman Kenney and who in every instance asserted that the work would be continued more aggressively than ever before: Mr. F. J. Hanlon, representing the Iowa Committee on Public Utility Information; Mr. L. O. Ripley, representing the Information Bureau of Kansas Public Service Companies; Mr. E. H. Rosenquest, representing the New York State Committee on Public Utility Information; Mr. C. W. Tippy, representing the Michigan Committee on Public Utility Information; Mr. H. B. Flowers, representing the Louisiana-Mississippi Committee on Public Utility Information; Mr. Joseph B. Groce, representing the New England Bureau of Public Service Information; Mr. J. P. W. Brown, representing the Tennessee Public Service Information Bureau; Mr. N. S. Argabrite, representing the Virginia Committee on Public Utility Information and the Information Committee, Public Utilities Association of West Virginia; Mr. L. W. Scherer, representing the Oklahoma Public Utility Information Bureau; Mr. C. H. Elliott, representing the Rocky Mountain Committee on Public Utility Information.

Owing to lack of time, representatives of other bureaus present were not called upon individually, but it was the unanimous vote of the meeting that the work of the bureaus should be continued.

Subsequently Chairman Kenney appointed the following committee to survey the work of the bureaus and make suggestions for strengthening them and making their work even more effective than it has been:

B. J. Mullaney, Peoples Gas Light & Coke, Chicago, Ill.; W. H. Hodge, Byllesby Engineering & Management Corporation, Chicago, Ill.; S. J. Quinn, Electric Bond & Share Co., New York, N. Y.; Joseph B. Groce, the Edison Electric Illuminating Co. of Boston, Boston, Mass.; James M. Bennett, the Philadelphia Electric Co., Philadelphia, Pa.

International Chamber of Commerce Meeting

THE Holland-American Line S. S. Statendam has been designated as the official ship to carry delegates to the Fifth General Meeting of the International Chamber of Commerce to be held in Amsterdam, Holland, July 8-13, 1929.

The Statendam will land the American delegation at Rotterdam, Holland, July 7th. A special through train will convey the delegation direct to Amsterdam.

Details of the meeting and information regarding bookings, etc., should be addressed to Mr. John P. Gregg, Manager, American Section, International Chamber of Commerce, Connecticut Ave. and H St. N. W., Washington, D. C.

Texas Teachers Association Thanks Industries for Cooperation

THE following resolution of thanks to industries for cooperation was adopted by unanimous vote of the Texas State Teachers Association at their Fiftieth Annual Convention at San Antonio on December 1:

"WHEREAS, it is an established principle that the public schools, colleges and universities have the responsibility of training students for active participation in the duties of citizenship, and for taking their place in the productive activities of American industry, and

"WHEREAS, during the recent political campaigns the integrity and good judgment of school and college officials have been attacked because they voluntarily availed themselves of the offers of cooperation of various industries whereby students could be made acquainted with the basic economic, business and industrial conditions underlying the occupations in which they would later find employment, and

"WHEREAS, such cooperation with the industrial activities has been the result of our mature judgment, and actuated by an honest purpose to provide students with a type of practical information and training otherwise unattainable;

"THEREFORE, BE IT RESOLVED that the Texas State Teachers Association hereby reaffirm its purpose to make available to its students in the schools of Texas all available economic, business and industrial information which properly finds a place in the instructional program that may be obtained through the numerous legitimate sources of cooperative industrial channels;

"THAT we shall, as in the past, guard zealously our responsibility for providing a type of training which will develop our students an independence of attitude and freedom of judgment, upon which the well being of our public institutions depend;

"THAT we fully appreciate the educational value of legitimate cooperation with all industrial activities which place at our disposal, for our voluntary use, the essential information required for the well-rounded training of our students;

"THAT we express our appreciation for the cooperation Texas business and industrial institutions have consistently given us, and welcome a continuance of these efforts which enable us to give our students a deeper and broader appreciation of those factors so essential in productive American citizenship."

Interest in World Engineering Congress

INTEREST in the World Engineering Congress to be held at Tokyo, Japan, from Oct. 29 to Nov. 7, 1929, already great among American engineers, has been further stimulated by the presence in the United States of Dr. M. Kamo, dean of engineering at the Imperial University in that city, president of the Japanese Society of Mechanical Engineers and chairman of the organizing committee of the coming congress.

Conference of Utility Association Secretaries

By O. A. Weller

A UNIQUE movement was initiated by secretaries and managers of state, regional and national utility associations in June, 1923. In October of that year the first conference of those engaged in this work was held at Atlantic City in connection with the annual convention of the American Gas Association. From the modest beginning at that time when less than a dozen persons participated, there has now developed a well established and effective annual session designated as Conference of Utility Association Secretaries. The seventh session for this purpose was held in New York City, December 3, 4 and 5, 1928.

The purpose in coming to New York City was to get a close-up viewpoint of office systems and methods as employed by the American Electric Railway Association, the American Gas Association and the National Electric Light Association. Accordingly Monday, December 3 was A. E. R. A. day; Tuesday, A. G. A. day and Wednesday, N. E. L. A. day. The program for each day included an inspection of the office arrangement and methods used by the respective associations, and addresses by officers and staff members of each association. In this way all the secretaries in attendance secured a more thorough understanding of these national associations than could otherwise have been possible.

In addition to the messages by Lucius Storrs, Alexander Forward and Paul S. Clapp, who serve as managing directors of the three national associations, and the splendid reviews on specific lines of association research and service given by staff members, significant addresses were made by George B. Cortelyou, B. F. Weadock, J. F. Owens, O. C. Fogg and James B. Wootan. The subjects covered by these national speakers have to do with current problems faced by the various branches of the utility industry in the association represented.

Those present will always be indebted to these speakers for such expressions as the following:

"We should shape our course not so much with a view to escaping criticism as to avoid deserving it."—Geo. B. Cortelyou.

"Our vast country is now a single community. We cannot localize the effect of our acts. The amazing perfection of communication causes everyone everywhere to listen and to know. The burden of our work is to measure up to a high standard of conduct in each local community."—Paul S. Clapp.

"A misquoted statement may be corrected but it rarely happens that the second statement can catch up with the first and rectify it."—James B. Wootan.

Practically every state and regional association and geographic division, except in the extreme western sections of the country, were represented at this conference. About 65 persons were in attendance. From the opening session and throughout every speech and discussion there was a constant feeling of good will and friendly cooperation and a driving conviction that the job of those engaged in utility association work is to constantly strive for a more intelligent understanding of the problems and objectives of the industry in its several branches and to interpret this understanding for the benefit of Association members and the general public.

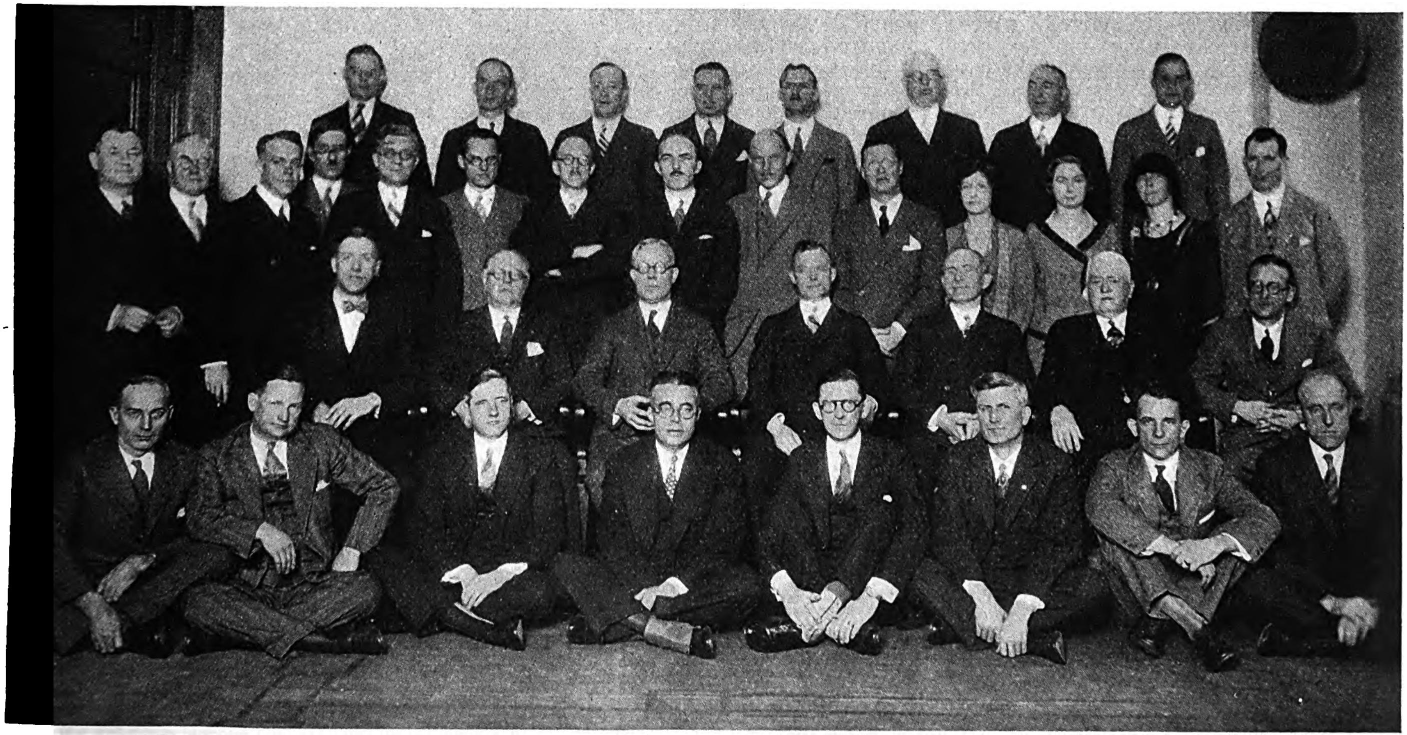
Edward F. McKay, Manager, Oklahoma Utilities Association, presided as Chairman of the sessions. To his personality and skill as presiding officer is to be credited much of the effectiveness of the Conference. O. A. Weller, Budget Director, Public Service Company of Colorado, Denver, who acts as Secretary of the Rocky Mountain Division, N. E. L. A., and of the Colorado Utilities Association served the Conference as Secretary. Officers elected for the ensuing year were O. A. Weller, Conference Chairman and Harold A. Buch, Secretary, Pennsylvania Electrical Association, Conference Secretary. Time and place of the 1929 session are Chicago, December 2, 3 and 4.

Illinois Society Plans Courses in Engineering

A NEW activity just started by the Illinois Society of Engineers is the handling of engineering extension work by a series of short courses, such as are conducted by some technical colleges.

New England Lighting Engineers Club Meeting

THE Lighting Engineers' Club of New England held its third meeting of the Season in Boston on November 20, 1928. An inspection of the new Keith Memorial Theatre and the new Cadillac Sales and Service Building was made.



AMONG THOSE WHO ATTENDED THE CONFERENCE OF UTILITY ASSOCIATION SECRETARIES

Front row: A. B. Campbell, John W. Lapham, C. E. Greenwood, A. Jackson Marshall, George F. Oxley, Thorne Browne, Wilgar Coleman, W. M. Carpenter. Second row (seated): O. A. Weller, E. F. McKay, J. W. Welsh, Paul S. Clapp, J. F. Owens, D. L. Gaskill, K. R. Boyes. Third row: J. B. Wootan, Fred W. Herbert, Fred C. J. Dell, J. W. McCloy, A. G. Schroeder, C. M. Kilian, G. W. Allen, H. A. Buch, H. M. Lyster, William Stokes, Miss Kathryn Herbert, Miss Isabell Davie, Miss O. A. Bursiel, E. N. Willis. Fourth row: S. F. Delaney, C. E. Earlywine, F. L. McKinney, Eustace Smith, Jr., Leslie Vickers, John N. Cadby, Herbert Sylvester, Charles W. Persons

International Conference on Bituminous Coal

By H. B. Lawrence
Henry L. Doherty & Co.

THE Second International Conference on Bituminous Coal, held at the Carnegie Institute of Technology, Pittsburgh, Pa., November 19-24, 1928, was attended by about 1800 engineers, scientists, industrialists and men of affairs. Some twenty nations were represented.

Low temperature distillation received the greatest attention. A projected K. S. G. plant which the International Coal Carbonization Co., a subsidiary of the International Combustion Engineering Corporation, is building at New Brunswick, N. J., was described at length. Dr. Soule stated that this plant had been patterned after the successful K. S. G. plant in Essen, Germany, where, since 1926, 50,000 tons of coal have been carbonized.

The New Brunswick plant will have a capacity of approximately 650 tons per day from eight retorts. A contract has been made with the Public Service Electric and Gas Company of New Jersey for the high calorific gas from the process. This gas will be blended with blue water gas, the final mixture to have a heat value of approximately 550 Btu. The tar from the process is to be sold to the L. J. Lewis Company and the coke will largely be sold for domestic fuel.

It was announced by Dr. Soule that the Lukens Steel Co. of Coatesville, Pa., had just contracted for a K. S. G. plant of approximately 560 tons daily capacity. In this plant, which will be the first in this country in connection with a steel works, the gas will be used for the heat treatment of steel, instead of the raw producer gas now used.

These two K. S. G. plants, which, when completed will be by far the largest in the world, indicate the extremely important advances made in the low temperature distillation field. They will be owned and operated by the International Coal Carbonization Co.

Dr. Soule stated that approximately $20,000,000 had been spent in fruitless attempts to establish commercially successful plants, and he pointed out the need of very careful analysis of conditions before entering into large scale operations.

It should be noted that no claims are being made for the K. S. G. system for the preparation of fuel to be used under boilers in power stations.

Mr. W. H. Allen, Jr., stated that the results realized at the Philo plant of the American Gas and Electric Co. with the "Carbocite" process have been sufficiently successful to warrant further study. The experiments carried out at South Bend and Philo have produced a good grade of domestic fuel, which is being favorably received in the domestic market. Under the present methods of operation about 20 per cent of the char goes through a ½ in. mesh. Studies are being made to reduce this percentage of fines.

At Moundsville, West Virginia, the Ben Franklin Coal Co. is operating a plant, using the Hayes process to convert slack coal from mining operations into domestic fuel, tar gas and light oils. The slack used is Pittsburgh No. 8 coal running approximately 39 per cent volatile, 51 per cent fixed carbon, 7½ per cent ash and 2½ per cent moisture. The products of the distillation were given as approximately 1430 lb. of coke, 29 gal. of tar, 2.1 gal. light oils and 3750 cu. ft. of 800 Btu. gas from 2000 lb. of coal.

It was stated that approximately 40 per cent of their coal mined is slack and in order to find a market for this material, which normally could not be sold for more than one-half the price of the screened product, they turned to low temperature distillation as a possible means of making a domestic fuel from this material. It is possible to operate the plant in conjunction with city gas plants, firing the retorts with producer gas, thus making the gas from the process available for commercial use.

In the foreign field progress in low temperature carbonization is also being made, but before making comparisons between the practice in the United States and abroad, it is necessary to give careful consideration to the economic conditions, natural resources, labor, habits, tariffs and subsidies in each particular field.

Enthusiastic attention was given to the subject of low temperature distillation, especially in its possible relation to utility operations, by the coal operator, the smoke abatement expert and the industrial concerns whose processes can be performed better and cheaper by making use of low temperature distillation products.

The world production of coal is approximately 1,200,000,000 tons per year of which the United States furnishes about 500,000,000 tons and Great Britain about 250,000,000 tons.

Due to conditions in the coal mining industry a large amount of research and scientific endeavor is being devoted to restoring this basic industry to a more wholesome state.

The demand for power in the United States is being met as follows:

	Per cent
Bituminous Coal	50.3
Natural Gas	5.8
Oil	21.4
Water Power	6.3
Firewood	5.5
Anthracite	8.1
Animal Power	2.5
Wind Mill	0.1
Total—	100.0

Between 1917 and 1927 bituminous coal production in the United States decreased 6 per cent, anthracite fell off 20 per cent, the total decrease in production being 8 per cent. In the same period oil production increased 169 per cent, natural gas 82 per cent, water power 110 per cent, so that the total production for coal in the United States for power purposes increased 18 per cent between 1917 and 1927.

Concurrently with this increase of fuel for power, there have been very important changes in markets and efficiency. Natural gas and petroleum have increased rapidly and bunker coal has shown a falling off. For locomotives the unit of production fell from 540 in 1904 to 380 in 1927 and this marked increase in economy has had its effect in reducing mining activities.

Of the total coal mined in the United States, locomotives use 27.7 per cent, electric utilities 7.7 per cent, coke ovens 16.0 per cent, steel works 5.4 per cent, coal gas industries 1.0 per cent, general manufacturing 20.8 per cent, domestic and other fuel 19.2 per cent and chemical and fertilizer plants 2.1 per cent.

In the electric utility field the output has grown from 5 billion Kw-hr. in 1902 to 90 billion in 1927, but along with this marked increase in output there has been made a most enviable record in the reduction of coal used per Kw-hr., the coal rate falling from 6.3 lb. per Kw-hr. in 1902 to 1.9 lb. per Kw-hr. in 1927. The average can be still further decreased because there are already in operation, large stations generating a Kw-hr. on approximately one pound of coal.

Such increase in economy for industries using 35.4 per cent of the fuel, has affected the coal mining industry and neither time nor money are being denied by the coal industry in the endeaver to meet the new conditions. The importance of this matter can hardly be overemphasized as the economic and social life of large areas is affected.

The papers on "Power" and "Combustion" were of interest and indicated that some really worth while information is being crysallized into tangible form.

The suggestions on ash melting, carbon losses, clinkering of, and fusion points of ash should be of especial interest to the power plant engineer. The present methods of taking fusion points of ash, analyses of furnace gases, handling of ashes, prevailing carbon losses and character of mixed fuels were discussed and suggestions made that may be a guide to better understanding of these subjects.

Pulverized fuel and stoker furnaces had their place in the meetings, and questions of temperature, time, turbulence and fineness received consideration. Dr. Rosin of Germany gave an extremely interesting paper on the "Theromodynamic Bases of Pulverized Coal Combustion" which brought out some of the points on fineness, temperature and time of combustion to which American engineers have devoted so much time.

Other papers described some of the important pulverized fuel plants in the United States an outlined developments that have taken place in the continued effort for higher ratings, better efficiency and lower initial capital investment.

Perhaps the most interesting papers, in so far as the small plant, railroad or marine man is concerned, were those presented by Mr. C. J. Jefferson of the United States Shipping Board and Commander J. J. Broshek, U. S. N., on the adaptation of pulverized fuel firing to marine work. The tests on the S. S. Mercer, a 9500 ton cargo vessel were given in detail.

Extremely interesting and illuminating contributions were presented on Gas, Gas Purification and Cleaning, Origin, Composition, Classification and Liquification of Coal, Tar and Oil, Fertilizers, and High Temperature Distillation.

It is a pity not to give some outline of the important work on hydrogenation, handling of pulverized fuel, the syntheses of various materials, etc., but lack of space prevents. The proceedings of the Conference will be published in two volumes and will cost $15.00.

Rural Electric Division, A. S. M. E. Meeting

By Ralph A. Palmer

A TWO-DAY program on rural electrification which sustained the interest of the engineer-audience till the final adjournment, was presented by the Rural Electric Division of the American Society of Agricultural Engineers, in Chicago, December 6 and 7. The rural service departments of the public utilities throughout the country, and particularly the middle west, were well represented.

The too often neglected farm wiring problem was handled by H. S. Hinrichs, agricultural engineer for the Kansas Power and Light Company and by H. H. Weber of the Rome Wire Division of the General Cable Corporation. A lively discussion following the papers, and numerous citations of uneconomical, inadequate and dangerous installations, showed the problem to be acute.

G. A. Rietz, district specialist in rural electrification for the General Electric Company, gave practical information on the subject of motor installation and pointed out that the performance of a motor is affected by the design of farm buildings and of the driven machinery. J. P. Schaenzer, field agricultural engineer of the Wisconsin rural electric project, presented a paper on the "Installation of Water Systems."

"Feed Grinding on the Farm," an illustrated paper by E. R. Meacham, manager of the rural service department, Wisconsin Power and Light Company, was the first paper given after luncheon, December 6. Other papers on the afternoon program were "Research in Rural Electrification," by W. T. Ackerman, director and engineer, New England Rural Electric Project; "Retail Dairy Refrigeration," by Truman E. Hienton, project leader in rural electrification, Purdue University; "Seed Corn Testing," by E. W. Lehmann, professor of farm mechanics, University of Illinois, and "Ventilation by Electric Fans," by G. C. Breidert, sales promotion engineer, Ilg Electric Ventilating Company.

The morning of December 7 was taken up by a series of round-table discussions on "Rural Load Building by Merchandizing," "Demonstrations and Exhibits," "Silo Filling," and "Grain and Feed Elevators."

Through the courtesy of the Public Service Corporation of Northern Illinois, the afternoon session was given to an inspection of the model farm of that company in Lake County.

A. E. S. C. Becomes American Standards Association

UNANIMOUS approval by the thirty-seven member bodies of the establishment of the American Standards Association to succeed the American Engineering Standards Committee, is announced by William J. Serrill, assistant general manager of the United Gas Improvement Company of Philadelphia. Mr. Serrill was chairman of the Standards Committee, and now becomes president of the American Standards Association. One of the most important results of the abandonment of the committee form of organization will, according to Mr. Serrill, be a much greater degree of participation by trade associations in the direction of the national industrial standardization movement.

The new body will not formulate standards, but will provide systematic means by which units in industry, when they find it necessary to set up standards, may come together for the purpose of formulating them.

The *Almost* Perfect Book

ALARMED by the failure of volunteer proofreaders to report errors in the "Code for Electricity Meters—Third Edition," published last May by the N.E.L.A., K. M. Elish, Editor of Publications, recently inquired of Dr. J. Franklin Meyer, U. S. Bureau of Standards, what errors had been discovered. Dr. Meyer, who headed the committee which revised the Code, made the following reply: "I have received no notice from anyone of errors in the Code."

Thus is challenged the ancient printers' dogma that no book is errorless, and another example given of what an editor can do when subjected to pressure by a committee that reads proof carefully.

Surges and Flash Overs

By Fred W. Herbert,

Director, Service Department
NELA

There is no mystery or black magic in the electric industry—just plain horse (power) sense.

* * * *

When the wagging tongue of a dissatisfied customer is converted by satisfactory service to a warbling tongue of praise, two things have been accomplished, one is the knocker has been changed to a booster.

* * * *

More and more property is becoming exempt from taxation and this places an increasing burden on the property that is not exempt.

* * * *

The electric industry not only talks of its abilities but it demonstrates them.

* * * *

Statistics cannot take the place of judgment.

* * * *

When a complaint desk gets the word, "We are all out of juice," watch your step. It may not always mean what you think it means.

* * * *

Trying to make customers out of friends is a natural plan, but making friends out of customers is a much wiser procedure.

* * * *

In our public relations we give out friendship, then we expect to get it and if you fail to receive friendship, keep right on giving, for the law of averages will win out.

* * * *

Plant and equipment are tangible assets, but "good will" is that intangible something that keeps plant and equipment going.

* * * *

What is the connection between Easy Street and Easy Payment Street—Simply an extension.

* * * *

What does buying comfort mean —Buying electric appliances of course.

* * * *

Statistics are those irrefutable figures the great orator makes up as he goes along.

* * * *

People accept you for your "face value" when you look pleasant and reject you when you look ugly.

* * * *

No matter how compelling your advertisement, how well dressed your windows, how inviting the threshold of your shop, all the care expended upon these important sales helps is greatly discounted if, when you are face to face with the customer, your deportment is not in keeping with the external qualities which induced him to come into the shop.

* * * *

A college education never hurt anybody who was willing to learn something afterwards.

FACTS and FIGURES

National Statistics of the Electric Light and Power Industry

As the result of the cordial cooperation of some 380 electric light and power companies in the United States in returning to the N. E. L. A. their monthly report of operating data, the association will soon be in a position to furnish, each month, a summary of the more important statistics of the light and power industry of the country.

The following form has been drafted in accordance with the suggestions and cooperation of the Statistical Committee of the Accounting National Section.

Proposed Form for Publishing of Monthly
NATIONAL STATISTICS
of the
Electric Light and Power Industry
Statistical Department—National Electrical Light Association

	This Year	Last Year	Per Cent Increase
Final Data for Month of			
Monthly Data			
*Kw-hr. generated plus kw-hr. received from other sources	....	....	....

Total number of customers	....	....	....

*By courtesy of U. S. Geological Survey, with deductions for plants not considered electric light and power enterprises.

It is proposed to make this report a feature in the "Bulletin" each month and beginning with the next issue, data for the month of September or October will be published. Comparative monthly data, however, will not be available until the January, 1929, reports have been summarized.

Due to the time required to receive the monthly reports from the companies and to summarize and extend them for the entire industry, it is proposed, as suggested in the above form, to issue final data for one month and preliminary data for the succeeding month.

It now requires approximately sixty days for all of the reporting companies to file their monthly report forms. As time goes on, however, it is hoped that the companies will be able to forward the reports to us so that final figures will be published not later than thirty days from the close of the month.

Capital Requirements of E. L. & P. Industry

The capital requirements of the light and power industry for extensions and improvements is graphically illustrated by figures given by the Statistical Research Department of the National Electric Light Association in a comparison of expenditures during the past three years with the expenditures of the railroads. The gross amount spent for new construction by these two branches of public service during this period is as follows:

Year	Spent by Railroads	Spent by Electric Light and Power Companies
1926	$885,086,000	$772,515,000
1927	771,552,000	793,744,000
1928 (estimated)	650,000,000	800,000,000
Total	$2,306,638,000	$2,366,259,000

An analysis of the expenditures of the light and power industry shows that more than twice as much is spent for the purpose of getting the current to the consumer as is spent to generate it. More than twice as much is spent for plants generating by steam than is spent on water power plants. The investor's dollar is being split up by the industry approximately as follows:

For steam generating plants	19.7 cents
For water power plants	8.8 "
For transmission lines	17.7 "
For distributing systems	27.7 "
For sub-stations	15.0 "
Miscellaneous	11.0 "
Total	$1.00

Public Utilities Make Best Showing

While 33 per cent of all the public utilities in the United States (exclusive of transportation) reported no net income for the year 1927 to the Bureau of Internal Revenue, an analysis of the figures by the Department of Statistical Research of the National Electric Light Association shows that these companies received only 5 per cent of the total gross income. In other words, while only 67 per cent of the companies earned a net revenue, these companies represented 95 per cent of the production. This is a better showing than that made by any other industry.

It is interesting to note that, while the average gross revenue of the companies reporting net earnings was $425,750, the average gross revenue of the company reporting no net income was only $47,100. This is one more indication that the day of the small isolated public utility is over. The trend of the average unit rate for the whole United States has been steadily downward for years, and with greatly increasd operating expenses it is only the large system that can show adequate returns on the money actually invested in the public service. The isolated plant has a relatively much higher unit cost of production, and in the face of the public demand for lower rates and continued improvement in service it cannot charge a rate which will pay a fair return on the value of the property.

The left hand side of the following table, prepared by the Statistical Research Department of the N. E. L. A., shows for various industries the per-

(*Continued on page* 62)

The Far Reaching Significance of Power Plant Efficiencies

By H. S. Bennion

Director of Engineering, N. E. L. A.

THE large industrial centers of the United States, generally speaking, are today served by steam generated electric power. Absence of water power possibilities makes more complete their dependence on power from fuels to supply the increased needs of the future. At the present time steam generating capacity is being installed in the United States three and a half times as fast as water power and this ratio is increasing.

Fortunately for these large centers primarily dependent on steam power, the history of the past 100 and more years gives promise of a long continued improvement in the art of producing such power.

The development of the steam engine by James Watt 160 years ago represented a tremendous advance in the harnessing of energy for the use of mankind and yet practically all of the energy in the fuel burned in those early steam engines went up the smokestack into the ash box or out of the exhaust pipe. From an almost negligible percentage, the overall efficiency—boiler and engine—has climbed slowly by one improvement after another until today the average better class steam station has an overall efficiency of over 25 per cent, and the latest and best plants have developed efficiencies a little over 31 per cent.

The chart (Fig. 1) shows the long slow climb over a span of a century and a quarter of the efficiency curve of steam power equipment. More than that, it shows the long distance yet to climb to reach perfection or 100 per cent efficiency. How rapid the climb will be and how near to 100 per cent will ultimately be attained is beyond the power of anyone to predict, but the record of the past promises well for the future of power supply in the industrial cities of the United States.

A second chart shows the range of coal prices of the past 25 years, and, for the same period, the corresponding fuel cost per kilowatt-hour generated.

The third chart shows for the 25-year period the pounds of coal needed to produce a kilowatt-hour of electrical energy. This curve translates into concrete and understandable terms and figures the direct advantages of the rising efficiency curve of the steam turbine and its boiler. In other words, the rise in the curve of efficiency is accompanied by an equivalent drop in the number of pounds of coal per kilowatt-hour.

These curves, recording as they do the compounded benefits from many improvements in power plant machinery, partly explain the downward trend of the electricity in the face of generally rising costs. Coal now costs three times what it did in 1905 and yet the fuel cost per kilowatt-hour of electric energy generated is the same now as it was then—thanks to increased mechanical efficiencies.

As each new development in combustion, in the production of steam, in the saving of waste heat, in condensing of steam to produce vacuum, and in the prime mover itself has been exploited

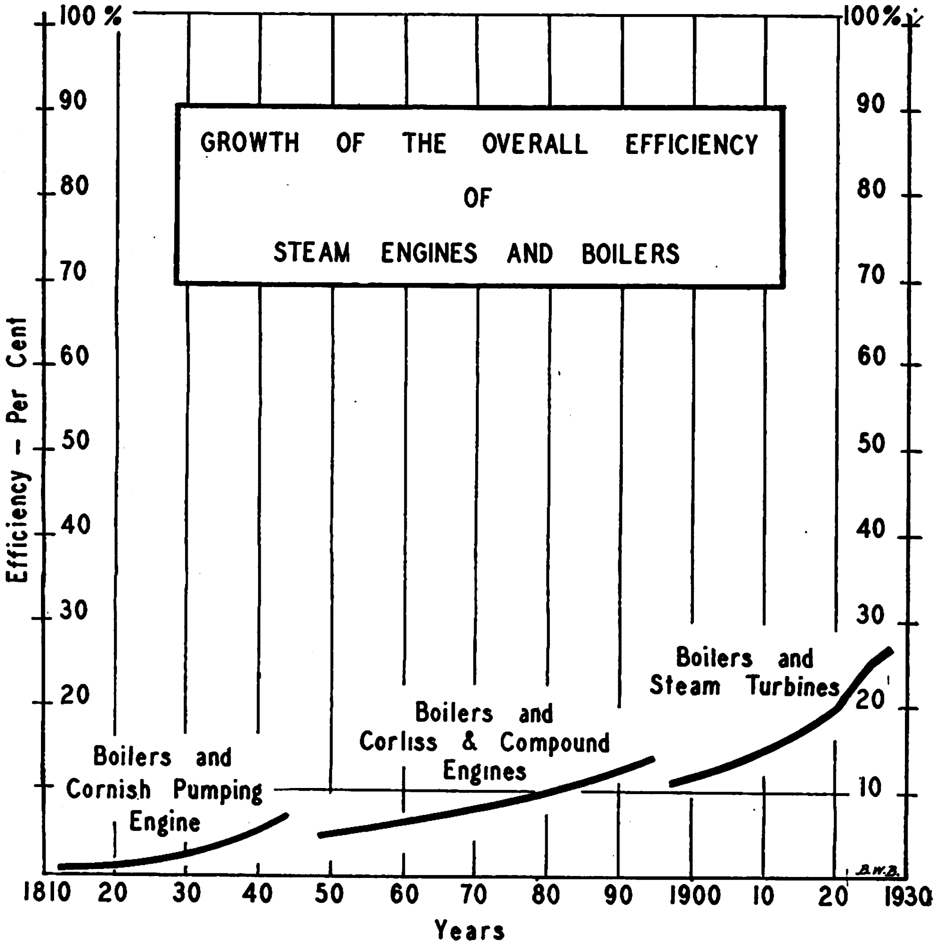

Fig. 1

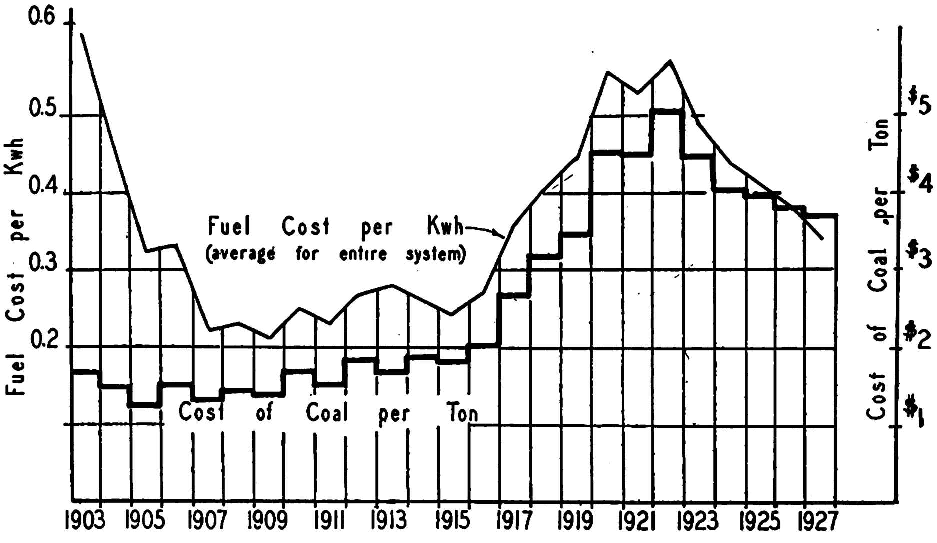

Fig. 2

and brought closer to perfection, it has seemed that the possibilities for further improvement in overall efficiency were nearing exhaustion, but there is yet so much room for improvement and improvements have been coming along so consistently that it may be taken for granted that they will continue to come. It is believed by those closest to the development field that efficiency in steam power production will climb in the next fifteen years about as far as it climbed in the past.

Turbine Efficiency Near Top

A fourth chart is added to show that the hydraulic turbine—the prime mover of the hydraulic power plant—has been perfected until it is now near the top. It is practicable to increase its efficiency a fraction of a per cent here and a fraction there but it is too near the ultimate to leave room for much improvement.

Turbine efficiency is of course but one factor in the cost of developing water power. Most of the other factors likewise hold out little or no promise of future development. Foremost among these is the increasing difficulty of meeting all the demands or satisfying all the interests which are attached to rivers and streams. The importance of streams for water supply, for fishing, for park and recreational purposes, for irrigation, together with the possibility of benefiting navigation and controlling floods, now have to be reckoned with more seriously than ever in the past as the interests affected by each of these uses or purposes become more pronounced.

The problem of coordinating the development of streams best to serve all purposes is rendered more difficult at the present time by the fact that the public generally holds an exaggerated view of the value of water power sites as revenue producers. This condition is readily explained by the fact that a lag of five to ten years is required for the public to become educated to a change in economic conditions, and the changed relation between the cost of steam-generated power as compared to hydro-electric power generation has been too rapid for the public to catch up with it. In a few more years the public's misconception will correct itself. The problem of coordinating the many uses of a river or stream will, however, remain because of inherent difficulties which are growing in magnitude with time. The chances of working out a scheme that will win approval become less and less.

Water Power Development to Decline

As shown by the last report of the Federal Power Commission, the rate of development of water powers has continued up to the present with very little abatement. This would seem to contradict what has just been said. This continued rate of development has largely been due, however, to the impracticability of closing out large development programs in the short space of three or four years. It is noteworthy, however, that at the present time on the entire Pacific Coast the construction programs for 1929 call for several steam plants, and no important water power developments are included. It may confidently be predicted that another five years will show a marked reduction in new water power developments and still greater dependence on steam, with an added urge to improve the efficiency of steam power production.

Picked up from

ELECTRICAL NEWS ITEMS

Issued weekly by Department of Public Information, National Electric Light Association, 420 Lexington Avenue, New York City. All or part may be used without further notice and with or without credit being given.

Cost of Lighting Streets

LIGHTING the city streets of the United States is an undertaking of amazing ramifications that devolves upon thousands of companies and an untold amount of equipment, as well as electric power from steam and hydro-electric plants. An attempt at calculating the benefits of this service would lead one into a maze of advantages and an added realization of the contributions of the electrical art.

Yet, what does this cost? What is the annual expense for the electricity that lights the street lamps of the nation? The bill for current for this purpose amounted in 1927 to slightly more than 68 million dollars, which is practically the same amount that was spent last year for dentifrices, perfumes and face powders by the people of this country. These latter figures are from a statement, dated November 20, 1928, from the Bureau of the Census of the Department of Commerce. For dentifrices and perfumes the nation's bill last year was more than the total bill for the electrical energy required for the motive power of all the street and interurban railways. Shampoos and depilatories cost about as much as the electrical power for all the electrified steam railroads.

Domestic Consumers Subsidized at Expense of Industry

THE Toronto (Canada) Globe of October 29th tells us: "Hydro officials (Officials of the Hydro-Electric Power Commission) point out that the system is not falling behind, but that they consider householders are getting current at less than cost, while commercial users are paying about $800,000 a year more than they should." However, it seems that adjustment of the Toronto rates, increasing the rates of small householders, will not take place before the end of the year and may be indefinitely deferred.

Light and Power authorities have long insisted that the domestic consumer of Ontario is being subsidized at the expense of the industrial and commercial power user. It is something to have the Hydro-Electric Commission admit it.

The Swiss Federal Railway System

THE Swiss Federal Railways have at various times been referred to as outstanding examples of successful government operation of utilities. Nevertheless these roads have been encountering difficulties in making ends meet, according to C. E. R. Sherrington, Secretary, Railway Research Service of the University of London.

The present tendency in Europs, he has pointed out, is to sever the relationship previously existing between the state railways and the financial affairs of the different governments. This was found necessary because the railroads were leaning too heavily on the national budgets.

Discussing the Swiss Federal Railways, the total mileage of which is 1,837, with about 627 miles electrified, Mr. Sherrington, as quoted in the December 14 issue of *Railroad Data*, said:

"The efficient Swiss Federal Railways are deservedly chosen by many as the ideal at which State-owned and operated systems in Europs should aim. Its economic studies, notably those dealing with the comparative advantages of steam and electric traction, have been the object of envy by many railway managements, and have provided very valuable data for similar studies in other countries. For some years the railway budget has been separated from the Swiss national budget.

"It is estimated that the financial results of 1927 may close with a deficit of 12 million francs, which would include 7 millions for amortization of deficits unavoidably incurred during the war period.

"During the ten-year period, 1915-1925, their railway debt has risen about 1,000 million francs. Thus, in spite of efficient management and the adoption of courageous policies, the Swiss Federal System is no exception to the State-operated systems showing no profit."

Why the Industry Will Prosper

MR. HENRY A. PORTER, research editor of the *Magazine of Western Finance*, lists the reasons advanced by competent authorities as to the certainty of continuous growth and prosperity in the electric light and power field as follows:

1. Less than two-thirds of the population of the United States live in homes which use electricity.
2. Less than 50 per cent of the homes wired for electricity use any domestic electric appliance except the flatiron.
3. The use of electricity in the home would be increased more than 1,000 percent if homes were equipped electrically throughout.
4. Less than 10 per cent of the farms in the United States use electricity in any form.
5. Less than 1 per cent of the entire railroad mileage of the United States is electrified.
6. The lighting of the nation's great network of highways and airways will prove a large source of new revenue.
7. Radio broadcasting, and the radio with an electric socket, have opened up a new field for consumption of current.
8. Present use of electric power by industries is less than 50 per cent of their actual power requirements.

Electricity in the Medical Field

AN announcement comes from Chicago that Dr. W. T. Bovie, head of the Department of Biophysics at Northwestern University, has been awarded the John Scott Medal and a premium of $1,000 by the City of Philadelphia for his work in the field of electro-surgery. The apparatus which he has developed makes possible surgical operations with an electric current instead of a knife. Operations performed in this way are entirely free from pain or surgical shock. For example, growths on the brain can be removed while the patient is fully conscious and aware of what is going on. The electric current not only makes the incision, but at the same time it closes the blood vessels so that even in operations usually accompanied by great loss of blood, no bleeding occurs.

The work of Dr. Bovie is only one more of the many tremendous contributions which have been made to the medical profession and to surgery by electricity. It will be recalled that when he occupied the Chair of Biophysics at Harvard University he conducted many experiments with the ultra-violet ray with the cooperation of President C. C. Little of the University of Maine. The ultra-violet ray is of particular value in the curing of rickets, a disease of the bones. Statistics show that between 95 and 100 per cent of the babies raised in large cities are more or less afflicted with it.

Another important development is an air compressor device used to draw the dangerous diphtheria membrane from a patient's throat and thus prevent strangulation. It is a delicate machine and has been used successfully in removing cataracts from the eye. Still another is the diathermia apparatus used in the treatment of pnuemonia and other diseases where it is necessary to generate internal heat.

The importance of the X-Ray not only in the treatment of disease but in diagnosing is known to every one. This has been developed to such a stage that the doctor in a small community or rural district can carry a portable machine to the patient's bedside, take a picture, send it by wire or radio to the specialist in a distant city and in a few hours have the benefit of his advice.

Another interesting apparatus is the electric stethoscope, a product of the investigations which are being constantly made by the Bell Telephone Laboratories. Every sound of the heart tells its story to the expert diagnostician and the electric stethoscope greatly magnifies these sounds. The most impressive application of this is in connection with the cathoderay oscillograph which makes it possible to see the graphic representation of the pulsating heart. This enables the physician or group of physicians to check hearing against sight in diagnosing.

ON page 731, December N.E.L.A. BULLETIN, in a group photograph the seated figure of Mr. W. T. McCaskey of the Middle West Utilities Company was erroneously captioned S. I. McElhoes, Counsel, Southwestern Light and Power Company. As one of the gentlemen involved has already expressed pleasure over the mixup and the other is expected to, an editorial apology would perhaps be out of place.

WHAT OCCURRED LAST MONTH

Consolidations

The Rochester, New York, Central Power Corporation has filed with the Public Service Commission of New York a petition for permission to acquire the outstanding common stock of the Lake Ontario Power Corporation, which serves a number of communities in New York State. The New York Public Service Commission has approved the transfer to the New York State Electric Corporation of the Morris, New York, Light and Power Corporation.

* * *

The Cities Service Company of New York has bought from the Central States Power and Light Corporation the Tecumseh, Michigan, Electric Company. The Central States Light Corporation has bought the Independence, Iowa, plant, formerly the property of the Northeastern, Iowa, Power Company.

* * *

The consolidation of the Delaware Public Service Company and the Delaware Electric Power Company was approved by the stockholders of both companies on Dec. 3.

* * *

On Dec. 10 was announced the formation of the Utilities Public Service Company, which is to acquire a group of companies valued in excess of $11,750,000. The company has attained control of the Associated Public Utilities Corporation and the Standard Service Corporation, through which service will be supplied to 171 communities in ten States.

* * *

On Dec. 11, the W. N. Albertson Company of Omaha announced the purchase of control of forty-one utility properties in North and South Dakota, North Carolina and Wisconsin.

* * *

Stockholders of the Northern Ontario Light & Power Company and of the Northern Canada Power Company, subsidiaries of Canada Northern Power Corporation, have approved the merger recommendation of directors.

* * *

The Newport, Vt., Electric Light Company has been acquired by W. B. Foshay & Company, Minneapolis.

* * *

The majority of the common stock of the North American Water Works & Electric has been acquired by the Atlantic Public Utilities.

* * *

The National Utilities Company has sold to the Georgia Power Company the electric plant at Manchester, Ga.

* * *

On December 1 the consolidation of three public service companies of Macon, Georgia, with the Georgia Power Company became effective.

* * *

The Federal Trade Commission's Investigation

Among the resolutions adopted by the American Federation of Labor at its convention at New Orleans was one opposing "all efforts of private and public service corporations and of real estate boards and other private corporations to inject covert propaganda into the public schools and universities." The National Grange, in session at Washington, D. C., Nov. 24, adopted a resolution opposing the "policy of the power trust in making use of our institutions of public education to carry on propaganda designed to further its interests."

* * *

On Dec. 1, the Federal Trade Commission filed in the Federal Court for the Southern District of New York an application asking for an order to require officers and employees of the Electric Bond and Share Company to produce certain records heretofore refused by the company, and to answer certain questions which were propounded at a Commission hearing and which witnesses then declined to answer.

* * *

The budget sent to Congress by the President on Dec. 5 calls for $262,000 for the Federal Trade Commission's investigation of the utilities and a chain store inquiry.

* * *

On Dec. 5 Senator Walsh of Montana introduced two bills, one forbidding any person, firm or corporation engaged in interstate commerce to offer or give anything of value to any teacher or member of a school board to induce him to write or revise textbooks or printed matter for schools or to teach any doctrine to influence opinion in favor of a policy advocated by such person, firm or corporation; the other bill provides that no publication claiming second class postage rates shall print any reading-matter for pay or furnished in substance by any person, association or corporation paying for display advertising in such publication, knowing it was so furnished, unless the fact that it was so provided or paid shall be plainly indicated.

* * *

The annual report of the Federal Trade Commission, sent to the Senate and House on Dec. 10, gives an outline of the progress of its utilities investigation.

* * *

On December 17 the Federal Trade Commission sent to the Senate its ninth interim report on the utilities investigation. This contains the statement that public hearings will be resumed early in January if court engagements permit. On December 8 Senator George, whose amendment to the Walsh Resolution caused the investigation to be conducted by the Federal Trade Commission instead of by a Senate committee, declared that the investigation thus far has rendered "an excellent and helpful service to the American people and to honest American business."

* * *

Hydro-Electric

On Dec. 2, the Federal Power Commission issued its annual report. This calls attention to the lack of adequate personnel which is preventing the proper functioning of the Commission and makes certain suggestions in regard to the regulation of interstate commerce in electric energy. It also states that water-power continues to supply about one-third of the total demand for electricity of the country.

* * *

On Dec. 5, the Federal Power Commission opened hearings on the application of the Cumberland River Power Company for a license to develop power at Cumberland Falls in Kentucky. The application is opposed by those who would create a State park, including the Falls.

* * *

It is announced that the Maine Development Commission will, for the information of the next Legislature, undertake a fact-finding survey of the power resources of the State.

* * *

A dispatch from Boise, Idaho, says that a permit for a $650,000 power-development on the Snake and Salmon Rivers has been issued. This calls for construction of a 450-foot dam on the Snake River, a diversion dam on the Salmon River and a 9-mile tunnel to connect the two.

* * *

The Canadian Government has named its group of experts to the Joint International Committee which has been authorized to examine the possible effects on fisheries of the proposed scheme for using the tides of the Bay of Fundy to develop electric power.

* * *

A dispatch from Sacramento says that the California Railroad Commission and the State Division of Engineering have begun an investigation into State supervision of dam structures with the possibility that new legislation may be prepared.

* * *

Engineers of the Central Maine Power Company have started preliminary work on the company's projected development of the hydro-electric resources of the Kennebec River near Bingham. This project is expected to develop about 60,000 H.P.

* * *

The Gatineau Power Company, controlled by the Canadian Hydro-Electric Corporation, a subsidiary of the International Paper Company, has commenced construction of another storage dam on the Gatineau River in the Province of Quebec. This dam will store the waters of Lake Cabonga and will form a reservoir of 45,000,000,000 cubic feet capacity.

* * *

Dispatches from Cedar City, Utah, say that the Dixie Power Company plans the erection in 1929 of an additional hydro-electric power unit on the Virgin River.

* * *

On December 13 Republican leaders of New York State announced that they would cooperate with Governor-elect Roosevelt in some of his proposals, but that this would not include a change in the Republican attitude on state development of water-power.

* * *

Production of Power

The Geological Survey of the Department of the Interior announces that production of electric power by public utility plants in the United States for October aggregated 7,900,899,000 kilowatt-hours, an increase of 14 per cent over the production a year ago.

Rates

The Public Service Electric and Gas Company, a subsidiary of the Public Service Corporation of New Jersey, has announced reductions in electric and gas rates effective Jan. 1, which, it is estimated, will result in savings to consumers of approximately $1,250,000 annually.

* * *

On Dec. 2, the New York Power and Light Company announced a reduction from 5½ to 5 cents per kilowatt-hour in Schenectady.

* * *

Reductions in gas and electric rates for Wakefield, Mass., will go into effect Jan. 1. The new rate for electricity for lighting will be 6 cents.

* * *

The Mohawk Hudson Power Corporation, since March 1, 1928, has had in operation in the Schenectady District of the New York Power and Light Corporation the so-called "counted room rate" for resident's use of electricity. This rate included a 25-cent charge for each room counted, a minimum monthly bill of 75c., a rate of 5½c. per kilowatt-hour for the first ten kilowatt-hours per month per counted room, and 3 cents per kilowatt-hour over that quantity. Operation from March 1 to Nov. 1 shows the rate-schedule has meant a saving to consumers at the rate of $56,000 per annum. A new reduction from 5½ cents to 5 cents for the initial rate has just been announced, and it is estimated that this will mean an additional annual saving to consumers of over $55,000, the total anual saving over the old rate being $111,000.

* * *

The Public Utilities Commission of Washington, D. C., has ordered reduced rates, to become effective Jan. 1. The household lighting rate will be reduced from 5.9 cents to 5.2 cents. The residential heating and cooking rate is reduced from 5.9 cents to 5.2 cents, with a secondary rate of 3 cents for current in excess of 10 kilowatt-hours. Commercial schedules are also reduced. The total annual reduction is estimated at $625,061.99. A feature of the new rate-schedule is a charge of $2.00 for reconnection of service for customers whose meters have been cut off because of non-payment of bills.

* * *

On December 18 Chairman Prendergast of the Public Service Commission of New York State said that the subject of the difference in the types of rates for gas and electricity in New York State is being studied by engineers of the Commission. Mr. Prendergast declared that at present there are six general types of rates employed in the electrical business and mentioned confusion resulting from use of different types in adjoining territory.

* * *

The Alabama Public Service Commission on December 13 conducted a hearing on the petition of the City of Mobile for lower residential lighting rates.

* * *

Regulation

The Massachusetts Department of Public Utilities, in response to direction by the last Legislature to investigate and report on the best methods of regulating and supervising gas and electric utilities, has submitted a report to the incoming Legislature advocating a bill similar to that sponsored by the Department last year. This contains provisions which would cause the utilities to enter into contractual relations with the state concerning rates. A second bill presented would repeal the present Massachusetts statute requiring municipalities to purchase the property of local companies if the municipalities should decide to go into the utility business.

WITH OUR CONTEMPORARIES

Appreciates Effort of Tennessee Public Utility Information Bureau

While this newspaper has always looked with favoring eyes upon the utilities of the state, it is just now beginning to appreciate the full service which they are rendering to the public. For a long time we thought of the power companies as organizations whose sole function it was to generate power to turn the wheels of industry. Now we have awakened to the fact that their service is more far reaching than we have hitherto realized.

The public utilities here in Tennessee have had, and are still having a tremendous part in the industrial development of the state. Without them Tennessee's now brilliant hopes of becoming the new industrial center of America would have remained unborn. The utilities have in a sense pregnated Tennessee with the desire to encourage new industries to locate within her borders.

The *Graphic* appreciates the splendid efforts that the Tennessee Public Utility Information Bureau is exerting in behalf of the state as a whole, and it is proud to have a small part in carrying the utilities' messages to the thinking people of this community.—Halls, Tenn., *Graphic.*

The Real Yardstick in the Utility Business

The Golden Rule is the real yardstick in the Utility Business. The extent to which the consumer is given his money's worth in service and satisfaction, is the measure of our success. If we do that our business is what it should be. If not, then representatives of the company must get a new and better conception of their work.—*The Southwestern.*

Why Our Country Uses Most Electricity

Our country uses almost as much electricity as all the rest of the world put together. Why? Because it has been made almost universally available; because the standards of service are maintained to the general satisfaction of the customers and because the price at which service is sold is easily inside its value.—Atlanta, Ga., *Constitution.*

Canadian Province Rejects P. O.

After a spirited fight between advocates of public and private ownership of hydro-electric developments, the provincial government of Manitoba has leased the water powers of Seven Sisters Falls on the Winnipeg river to a subsidiary of the Winnipeg Electric Company for a term of 50 years, under stipulation that the province may take over the property at the end of 30 years. More than that, the government at Ottawa has confirmed the lease, a procedure that was necessary, for when Manitoba was admitted to provincial status, the Dominion government reserved provisional control over natural resources there. With respect to the provinces of the original confederation there is no such provision.

The leasing of the power of the Seven Sisters Falls, marks somewhat of a departure from policy in Manitoba. It is a great victory for the advocates there of private enterprise. Clearly the people of the prairie province no longer share belief with the people of Ontario that there is virtue only in public ownership and operation of power developments. In this license Manitoba has declared for the policy, commonly accepted in the United States, of private operation under public control a policy the wisdom of which experience has amply demonstrated."—Buffalo, N. Y., *News.*

Not Shocked at N.E.L.A.'s Efforts

We are not particularly shocked at learning that an occasional utility group, especially the National Electric Light Association, has been financing research work in some of the agricultural colleges. A number of the professors, apparently, are on the utility pay roll. Does it mean that the educators and the institutions have been bribed? We guess not. Of course the power groups want to sell electric current to the farmer, but they probably are too clever to waste money in useless propaganda. Unless the use of "juice" for power and light is practical in the country, as it is in town, high pressure salesmanship will not make permanent customers. Electricity is fine on the farm. No doubt about that. But is it just useless expense, or is it a money-saving investment? That's what everybody wants to know—the power companies, experiment stations, and farmers. Any honest attempt to answer that question seems to be worth while, even if the N. E. L. A. provides some part of the funds used by the experimenters in research.—*Farm Life.*

"Damned if They Do and Damned if They Don't"

If the Nebraska Power company and the rest of the electrical industries in Nebraska had not come out in the open and told the public their story they would have been damned by some for keeping information under cover. Now, when they tell the people their story, they are damned for being propagandists.

If the electrical companies had tried to solve the rural electrification problem without cooperation from outside sources, they would have been damned because they had not got all the help possible to speed electricity to the farm. Now, when they appeal for outside help to bring about quicker electrification of the farms of Nebraska, they are damned for trying to spread propaganda in our state university.

It appears to us that they are damned if they do and damned if they don't. This kind of destructive criticism will never build our city and will never build our state. Prosperous cities and progressive states are developed by cooperation, by recognition of merit, and by confidence, and not by destructive criticism, suspicion and harangue.—Chas. E. Hall, in *Omaha's Own Magazine and Trade Review.*

An Ordinary Incident of Modern Business

Time was, not so many years ago, when a merger of utility companies, such as that just reported from Weston and involving plants there, at Glenville St. Albans, Dunbar and Rainello, raised a howl of protest. Now, however, such mergers are accepted as an ordinary incident of modern business.

What is the reason for this radical change of public opinion! There are several. The main one is, perhaps, an awakened appreciation of the fact that in union there is greater efficiency, more economy and enhanced public service. It represents a logical economic improvement. But behind this other factors have operated during the intervening years.

The public utilities learned through experience that it paid better to conduct their concerns with due regard for the needs and welfare of the people than to subserve the wishes and whims and greed of their owners.

Then public regulatory laws and bodies were created to prevent exploitation of such properties for personal benefit.

Also, ownership of these utilities has changed over the years. Formerly they were held by individuals, families or a small group. Now these concerns are largely owned by the people.

Without these factors, there would probably be as much of a howl today against such combinations as formerly. —Clarksburg, W. Va., *Telegram.*

Senator Walsh Pulls a Popgun on Propagandists

(Original title of article)

The Congressional mill has already begun to grind and even before its working parts have started to function smoothly it has yielded something of interest to all advertisers and publishers. This consists of a bill (S. 4707) introduced in the Senate by the senior Senator from Montana—Thomas J. Walsh. It was read the first time by title, the second time at length (ask a parliamentarian to explain what that means) and then referred to the Committee on Post Offices and Post Roads. This is how it reads:

> Be it enacted, etc., That no publication entitled to or claiming second-class postage rates shall print any reading matter for pay or furnished in substance by any person, association, or corporation paying for display advertising in such publication, knowing it was so furnished, unless the fact that it was so provided or paid for shall be plainly indicated in a statement published in connection with such reading matter: Provided, however, That the prohibition hereof shall not extend to matter that is obviously ordinary advertising. Upon finding by the Postmaster General that any publication has violated the provisions of this act all privileges it enjoys to second-class rates shall cease, but after the lapse of six months from and after such finding they may, in the discretion of the Postmaster General be restored.

The story back of this bill is quickly told. Senator Walsh is the author of the original Senate resolution, passed during the last session of Congress, which directed the Federal Trade Commission to investigate the public utilities. Anyone who reads the news knows that the Trade Commission lost no time in setting in motion the wheels of the investigation and what has since been uncovered is either an atrocious plot or a perfectly legitimate educational campaign—it all depends on the glasses through which one views the discovery.

Of course, Senator Walsh's binoculars have been of the kind that radically distort everything the Commission turns up. Two things in particular have roiled the Senator. One is the work which the public utilities have done through the school system. The other is their method of utilizing the advertising and news sections of publications to further their aims.

These things have so annoyed the Senator that he has introduced two bills which, if they are ever passed—and that scarcely seems likely—would most effectively put a quietus on the educational activities of the utilities. By some that might be considered serious enough, but it becomes downright calamitous when one realizes that the second of these two bills—the one aimed at propaganda in publications—would, according to the New York *Sun*, cause most authorities on various subjects either to give up their anonymity or their honorariums.—*Printer's Ink.*

The *New York Sun* in the editorial referred to above concludes thus:

Senator Walsh's bill is fortunately silly enough to kill itself. When it is dead we suggest that he draw one aimed at obnoxious propaganda methods: an act which will prevent, for instance, a Senator from using his franking privilege to send out 300,000 pieces of mail in a primary campaign. The senior Senator from Montana is quite familiar with the evils that attend the frank, for he is the Senator who sent out the 300,000 pieces of mail, at the public's expense, in his effort to capture the Democratic delegates from California to the Houston convention.—*New York Sun.*

REVIEWS OF N. E. L. A. AND RELATED PUBLICATIONS

State Laws Relating to Theft of Electric Current: Serial Report of Meter Committee, N. E. L. A. Pub. No. 289-7, 26 pages. Price, 40c; to members, 25c.

THE Meter Committee of the National Engineering Section has just published a compilation of statutory provisions of the states of the Union and the District of Columbia governing the unlawful diversion or theft of electric current. The statutes were compiled by the general counsel for the Association. The compilation shows that the District of Columbia and every state, with the exception of Oklahoma, have laws of some kind on the subject. Most of the statutes are limited to electric current and gas, but many cover electric current, gas, water and steam. In Oklahoma the statute covers only gas. In other states, steam heating, telegraph and telephone are included.

The New York law, which is very comprehensive, reads as follows:

> Sec. 1431.—A person who willfully, with intent to injure or defraud:
>
> 1. Connects a tube, pipe, wire or other instrument or contrivance with a pipe or wire used for the conducting or supplying illuminating gas, fuel, natural gas or electricity in such a manner as to supply such gas or electricity to any burner, orifice, lamp or motor where the same is or can be burned or used without passing through the meter or instrument provided for registering the quantity consumed, or uses such gas or electricity obtained by reason of the making of such connection; or,
>
> 2. Obstructs, alters, injures or prevents the action of a meter or other instrument used to measure or register the quantity of illuminating fuel, natural gas or electricity consumed in a house or apartment, or at an orifice or burner, lamp or motor, or by a consumer or other person or a person other than a State inspector or deputy inspector of gas meters or an employee of the company owning any gas or electric meter, who willfully shall detach or disconnect such meter, or make or report any test of, or examine for the purpose of testing any such meter so detached, or disconnected; or,
>
> 3. In any manner whatever changes, extends or alters any service or other pipe, wire or attachment of any kind, connecting or through which natural or artificial gas or electricity is furnished from the gas mains or pipes or wires of any person, company or corporation without first procuring from said person, company or corporation written permission to make such change, extension or alterations, or uses gas or electricity obtained by reason of such changes, extensions or alterations without first procuring the written permission aforesaid; or,
>
> 4. Makes any connection or re-connection with the gas mains, service pipes or wires of any person, company or corporation furnishing to consumers natural or artificial gas or electricity; or turns on or off or in any manner interferes with any valve or stopcock or other appliances belonging to such person, company or corporation, and connected with its service or other pipes or wires, or enlarges the orifice of mixers, or uses natural gas for heating purposes except through mixers, or uses electricity or artificial gas for any purpose before it has passed through an instrument for measuring the quantity consumed, without first procuring from such person, company or corporation a written permit to turn on or off such stopcock or valve, or to make such connections or re-connections or to enlarge the orifice of mixers or to use for heating purposes without mixers, or to interfere with the valves, stopcocks, wires or other appliances of such person, company or corporation as the case may be; or,
>
> 5. Retains possession of or refuses to deliver any mixer or mixers, meter or meters, lamp or lamps or other appliances which may be or may have been loaned or rented to them by any person, company or corporation for the purpose of furnishing gas, electricity or power through the same, or who sells, loans or in any manner disposes of the same to any person or persons other than the

said person, company or corporation entitled to the possession of the same; or,

6. Sets on fire any gas escaping from wells, broken or leaking mains, pipes, valves or other appliances used by any person, company or corporation in conveying gas to consumers, or interferes in any manner with the wells, pipes, mains, gate-boxes, valves, stopcocks, wire, cables, conduits, or any other appliances, machinery or property of any person, company or corporation engaged in furnishing gas to consumers unless employed by or acting under the authority and direction of such person, company or corporation; or,

7. Opens or causes to be opened or re-connects or causes to be re-connected any valve lawfully closed or disconnected by a district steam corporation; or,

8. Turns on steam or causes it to be turned on, or to reenter any premises when the same has been lawfully stopped from entering such premises, is guilty of a misdemeanor.

Sec. 1431-a—The existance of any of the conditions with reference to meters, or attachments described in Sec. 1431 of this article is presumptive evidence that the person to whom gas, electricity, water or steam is at the time being furnished by or through such meters or attachments has, with intent to defraud created or caused to be created with reference to such meters or attachments, the condition so existing.

Sec. 1937—A person convicted of a crime declared to be a misdemeanor, for which no other punishment is specially prescribed by this chapter, or by any other statutory provision in force at the time of the conviction and sentence, is punishable by imprisonment in a penitentiary or county jail for not more than one year, or by a fine of not more than $500, of by both.

The courts have held that electric current and illuminating gas may be the subjects of larceny. In the case of Commonwealth v. Caroline Shaw, 86 Mass. (4 Allen) 308m, the court said: "There is nothing in the nature of gas used for illuminating purposes which renders it incapable of being feloniously taken and carried away. It is a valuable article of merchandise bought and sold like other personal property, susceptible of being severed from a mass or larger quantity and of being transported from place to place."

The statute of Vermont was contested on the ground that it makes it a crime to use unlawfully the current from a line owned by a corporation, but it does not make it a crime to so use the current from a line owned by an individual, partnership, or association. In sustaining the statute, the court said that "Speaking broadly, it is the province of the Legislature to decide what acts are sufficiently inimical to the public welfare to be declared to be criminal. In the matter of creating and defining criminal offenses, the Legislature has a very broad discretion, with the exercise of which the courts can interfere only when constitutional limitations plainly have been transgressed. The power of classification for such legislative purposes will be reviewed only when exercised in a palpably, arbitrary manner. It is established by the decisions that a criminal statute enacted for the protection of a particular class is not unconstitutional simply because the specified class is not all-inclusive or might have been so enlarged as to include other equally meriting the same protection." (State v. Shady, 186 Atl. 27; 188 Atl. 777.)

A comparison of the compilation shows a great diversity in the text and the punishment for the violations thereof. Penalties range from fines of $5 to $1,000 and/or imprisonment of one day to ten years. Some statutes provide for the recovery of damages in a civil action by the person or corporation injured. In New Hampshire, in addition to a fine, the person or corporation injured may recover treble damages. What is to be desired is more uniform legislation in the different states. — John D. Van Wagoner.

Practical Uses of Steel and Concrete Poles: Serial Report of Overhead Systems Committee, N. E. L. A. Pub. No. 289-6, 22 pages. Price .40; to Members .25.

This serial report presents some of the general considerations relative to the use of steel and concrete poles, followed by summaries of replies to questionnaires on their use by companies in this country.

The report gives the advantages of steel poles over wood as: longer life, greater strength, lower maintenance cost and smaller depreciation charges. Conversely, the disadvantages are: Higher initial cost, greater hazard for linemen at work, and in the case of fabricated structures, greater ease with which they may be climbed by an unauthorized person.

However, the report points out, there is no hard and fast rule which dictates the use of steel poles over wood poles or any other structure. Each line must be judged on its own merits, and a careful study made of all the factors involved before a choice can be made.

There has been comparatively little use of reinforced concrete line poles by power companies in America, but the subject will undoubtedly be a very live one in the near future, the report says.

Most of the concrete poles now in use were made at the places where they are installed, and because of their great weight could not be moved economically with the equipment available in the past. Answers to questionnaries indicate that past installations have been limited to locations where there was good assurance it would not be necessary to move these poles, and to locations where requirements were for greater strength, improved appearance or longer life. In all cases which have come to the attention of the subcommittee which prepared the report, concrete poles have been used for distribution purposes where one or more of the above considerations were particularly urgent.

It seems probable that there is room for considerable improvement in the methods at present employed in manufacturing concrete poles. The use of waterproofed concrete and of rust-proofed reinforcement may prove decidedly beneficial in increasing the life of reinforced concrete poles. P. W.

Canadian Rum Runners Send Hooch by Electric Cable

NIAGARA FALLS, N. Y., Dec. 13 (A. P.)—Rumors have been current for some time that rum runners have smuggled liquor across the Niagara Gorge from the Canadian to the American side by means of the cables of the power transmission line which spans the gorge from near the Ontario Hydro Commission's plant at Queenstown to a location below Devil's Hole on the American side were given credence. Ontario Provincial police seized an automobile containing liquor, block and tackle lines and pulleys near the hydro plant on the Falls Queenstown Highway on the Canadian side.

The transmission towers on the Canadian side are much higher than on the American side and the cables have a sharp descent toward the American bank of the gorge. This aids the runners in working a basket or other carrier containing the liquor over the cable, the Canadian authorities assert.

With block and tackle and sufficient lines, the Ontario Provincial police say, the runners could work the liquor across.—*New York Evening Post.*

Maybe that's how white lightning gets that way.

The Genesis of a Joke

Or How the Scotchman Is Made to Pay and Pay and Pay

The story has come to us that when the door to a hidden closet was recently opened in an Alpine, Mich., home an electric light bulb was found to be burning and as far as the tenants and former tenants were able to recall, that closet had not been opened for sixteen years etc., etc.—January, 1928, N. E. L. A. Bulletin.

* * * *

And now look what's going the rounds.

* * * *

When electrical engineers were asked to give quotations on overhauling the lighting system of a theatre in Aberdeen, Scotland, a certain line was found to disappear in a wall where the trail ended.

Nearby was a locked door, the key to which had been lost. No one from the manager to the call boy could remember that the door had been opened. It was forced. The unknown room had been used by billposters, and according to a poster lying on the floor there the place had not been used since 1906.

A 16-candle-power carbon lamp was burning brightly just as it had evidently been left by the last occupant of the room. *When the manager estimated the cost of the wasted light for 22 years, he fainted.*

CORRESPONDENCE

To the Editor:

In a recent article, the writer made some such statement as this—"—service, (punk word)" and since has had his sensitive ear drums smitten with anguished protests.

So he repeats, "Service—punk word."

Now it didn't use to be, or so I am told. But it is now—in many instances. We need a new word to denote *personal* service. Most present day usage of the word service denotes *dollar* service. We hear about this service and that service, and a thousand and one different "services," and in many instances—most instances—when you try them out, you feel you didn't get a Continental dam's worth more for your money than what you paid for, and sometimes not what you paid for.

If service is merely a commodity, to be bought and sold, perhaps the present use of the word is all right. However, everybody with any old thing to sell, from worn out automobile tires to a patent hickey to keep your last collar button from rolling under the chiffonier when you're in a hurry, yells at you from roadside signs, pennants, newspaper and magazine ads, slogans on letter heads, envelope enclosures, shipping tags, telephone calls, etc., etc., ad infinitum, about their wonderful service, and in only rare instances do you get what, to the writer's way of thinking, is real SERVICE.

Now, delivering a man exactly what he orders, or pays for, from a hot dog with trimmings, to dependable electric service, is service—of a sort. But real SERVICE is delivering him more than he expects to get, with extras thrown in—the slice of pickle on the sandwich without being charged an extra nickel or dime for it—little personal things—courtesy—(genuine courtesy, not the commercial variety)—thoughtful consideration of individualistic needs—the personal relationship with him that makes him feel as though he is being dealt with as a flesh and blood human being, instead of just another one of those things classed as a customer—good, fair or poor, or a prospect, hot or cold.

The heads of most businesses, including the public utility business are imbued with the idea of service as I have outlined it in the preceding paragraph. The sad part of the situation is that so many of the people who must come in contact with the customers or prospects of big business can't or won't get the idea into their heads.

How to pump it into them? It probably can't be pumped in. Some people are so selfishly constituted that they'd never get the idea. But somehow or other the writer feels that if he were the president or general manager of a big business — ANY business — public utility, chain lunch counter or hair tonic dispensary, he'd spend a lot of his time —most of it—in trying to get this idea of *personal* service beyond the *dollar* service over to his employees, and let somebody else do some of the other things he might be tempted to do, instead of making an occasional speech on the subject, or issuing a perfunctorily worded bulletin or command semi-occasionally and then presumably forgetting about it until some particularly grievous complaint brought it to his attention again.

The success or failure of any business or endeavor depends not nearly so much on the excellence of its product, as on what people think about it; and what they think about the employee with whom they must come in contact in buying, using or paying for it has a whole lot more to do with what they think of the product than the product itself.

Do I hear somebody say, "What a fine, idealistic sermon! But old stuff. Sounds well, but in these days of huge corporations it can't be done. If they get *dollar* service, people ought to be satisfied."

Well, maybe so.

C. M. KILIAN.

centage of companies reporting a net income, the percentage of the total gross income earned by these companies and the average income per corporation. The right hand side shows the percentage of companies reporting no net income, the percentage of the total gross income earned by these companies and the average income per corporation.

This table emphasizes one of the major trends of American industrial progress, namely, the continual concentration of successful business in larger units which, because of the economies effected by mass production, are able to show profits to their investors and at the same time reduce the cost of service to the consumer.

The Electric Light and Power Industry During 1928

(*Continued from page* 24)

books at approximately $10,000,000,000, being exceeded only by agriculture, steam railroads and the oil-producing and refining industry. Gross revenues from the sale of current during the year approximated $1,900,000,000, out of which the light and power industry paid $175,000,000 in taxes.

Electric power costs to the public, including industrial, commercial and domestic uses, remain at pre-war levels, despite the fact that living costs are 65 per cent above pre-war levels. Advances in efficiencies of steam turbines and high-pressure boilers have reduced the average consumption of coal from 3.2 lb. per kw-hr. in 1919 to 1.7 lb. in 1928. Lowered cost of electricity generated by fuels brings such power into increasingly sharp competition with water power, which forms but 36 per cent of all power generated by the electric light and power enterprises of this country.

Information from the National Electric Light Association records shows that each year 250,000 customers buy the stocks of the light and power companies. The total number of individual security holders (excluding such indirect ownership as is represented by insurance companies, banks and similar institutions) is estimated to be in excess of 1,500,000.

Extracts from the Constitution of the National Electric Light Association

ARTICLE II—OBJECT

The object of this Association shall be to advance the art and science of the production, distribution and use of electrical energy for light, heat and power for public service.

In the furtherance of this object its activities shall be largely educational and for the fullest development of the electrical engineering arts and sciences in all their branches.

It shall not be engaged in business.

ARTICLE III—MEMBERSHIP

SECTION 1. *Members shall be divided into ten classes — Central Station Company Members (Class A), Central Station Individual Members (Class B), Invited Members (Class C), Manufacturer Company Members (Class D), Manufacturer Individual Members (Class E), Associate Company Members (Class F), Associate Individual Members (Class G), Foreign Company Members (Class H), Foreign Individual Members (Class I), and Honorary Members.*

SECTION 2. *Class A members shall be regularly incorporated public service companies engaged in producing and supplying electrical energy for light, heat or power for public use. They shall be entitled, through their regularly accredited delegates, to attend all meetings of the Association, to vote and to hold any office.*

SECTION 3. *Class B members shall be officers or employees of Class A members, elected or continued from year to year with the written approval of the Class A members with which they are connected. They shall have the same privileges as Class A members, except the right to vote at the executive sessions of the Association.*

SECTION 5. *Class D members shall be companies or firms engaged in the manufacture of apparatus, machinery, equipment, supplies or material for the production or use of electrical energy. They shall be entitled, through their regularly accredited delegates, to attend all meetings of the Association, to vote and to hold offices not restricted by provisions of this Constitution to other classes (see Article V—Officers).*

SECTION 6. *Class E members shall be officers*

To *Members* and NON-MEMBERS

IN 1923 Class B members (officers and employees of Class A members —electric light and power companies) numbered 9096 (membership in all classes totaled 12,529).

Without a membership campaign or the application of any pressure of whatever nature to gain new members, Class B membership now stands at 15,368 (membership of all classes totals 20,847).

Campaigns for Class B members have been proposed and discussed on a number of occasions, but the invariable conclusion has been that some members gained through the emotional stimulation of a high pressure membership campaign might not be the type desired by the association.

It is felt that those men and women who voluntarily become associated with the National Electric Light Association do so with the realization that membership is, in itself, and aside from

any immediate and tangible value, a token of the interest they take in their profession.

To judge from numerous inquiries that have reached headquarters and from other evidence, there are many eligible men and women, of the type who can profit most from membership, who are unacquainted with the conditions under which they may join the Association.

To these men and women, these pages, carrying the necessary information, are addressed. For their convenience and immediate use a detached application form is made available on these pages. Additional class B application blanks, or blanks for any other class of membership will be mailed upon request to the Secretary, National Electric Light Association, 420 Lexington Avenue, New York, N. Y.

It is also hoped that any member who feels so disposed will pass this copy of the N. E. L. A. BULLETIN to some coworker who may be interested.

EXTRACTS FROM CONSTITUTION

ARTICLE III—CLASS "B" MEMBERSHIP

Section 3. Class B members shall be officers or employees of Class A members, elected or continued from year to year with the written approval of the Class A members with which they are connected. They shall have the same privileges as Class A members, except the right to vote at the executive sessions of the Association.

Section 12. Individual members (Class B, Class C, Class E, Class G and Class I) may purchase, at member price, proceedings, handbooks, and other literature that may be published by the National Electric Light Association for general distribution.

ARTICLE IV—CLASS "B" DUES

Section 2. The annual dues of Central Station Individual Members (Class B) shall be Three Dollars ($3.00).

Section 11. In the event that an applicant for Class B, Class E and Class G membership is elected after July 1st, the dues for the remainder of the year shall be Two Dollars ($2.00), which will entitle the member to the *National Electric Light Association Bulletin* for the same period.

Section 15. All dues shall be payable in advance and shall cover the period of the calendar year. Any member in arrears for sixty (60) days shall be suspended from all privileges of membership, but may be reinstated when all outstanding dues have been paid.

Section 16. All dues of individual members (Class A, Class B, Class C, Class D, Class E, Class F, Class G, Class H, Class I), include subscription to the *National Electric Light Association Bulletin.*

or employees of Class D members, elected or continued from year to year with the written approval of the Class D members with which they are connected. They shall have the same privileges as Class D members, except the right to vote at the executive sessions of the Association.

SECTION 8. *Class G members shall be officers or employees of Class F members, elected or continued from year to year with the written approval of the Class F members with which they are connected. They shall have the same privileges as Class F members.*

SECTION 9. *Class H members shall be individuals or corporations not residents of the United States or of Canada, engaged in the central station industry, or interested in advancing the use of electrical energy, who shall ally themselves with this Association. They shall have the same privileges as Class A and Class D members, except the right to hold elective office or to vote at executive sessions.*

SECTION 10. *Class I members shall be officers or employees of Class H members, elected or continued from year to year with the written approval of the Class H members with which they are connected. They shall have the same privileges as Class H members.*

SECTION 12. *Individual members (Class B, Class C, Class E, Class G and Class I) may purchase, at member price, proceedings, handbooks, and other literature that may be published by the National Electric Light Association for general distribution.*

ARTICLE IV—DUES

SECTION 2. *The annual dues of Central Station Individual Members (Class B) shall be Three Dollars ($3).*

SECTION 5. *The annual dues of Manufacturer Individual Members (Class E) shall be Three Dollars ($3).*

SECTION 7. *The annual dues of Associate Individual Members (Class G) shall be Three Dollars ($3).*

SECTION 9. *The annual dues of Foreign Individual Members (Class I) shall be Five Dollars ($5).*

SECTION 16. *All dues of individual members (Class A, Class B, Class C, Class D, Class E, Class F, Class G, Class H, Class I), include subscription to the* NATIONAL ELECTRIC LIGHT ASSOCIATION BULLETIN.

Eye Openers from this Issue
THE SPOTLIGHT
So that he who runs may read

THERE are so many developments for the use of electricity for the benefit of mankind (and they have come so rapidly and each is so interesting, even fascinating) that we have jumped from one development to another, and all but the latest have been neglected.

It is time that we organized departments of high-grade men to specialize each in its branch of exploitation work. Then we will get the real development which each of these wonderful human helpmates is entitled to.

JOHN F. GILCHRIST, *in "Central Stations Think They Are Interested in Electrical Advertising."*

Many farmers who today are prosperous because of electrification combined with scientific methods of farming were as good as bankrupt a few years ago.

Amplifier Looks at Agriculture.

HE seems always to be in an enthusiastic glow about something—science, truth, education, the cosmos, turtle husbandry, some experiment of promise. So marked is the simplicity of his manner, and so hearty and informal his greeting, that it is difficult for the casual visitor to realize that this is a world-renowned scientist, the recipient of many degrees and medals, a man whose words are respected in the gatherings of grave and distinguished men.

MAURICE HOLLAND, *in "Willis R. Whitney — Moulder of Genius."*

NEVER has another industry been able to look back upon a scene of accomplishment equal to the contribution of the electrical industry to the people of their country. No other industry or group of people connected with it has ever been privileged to turn about and look forward with such hope and such confidence to the enormous contributions which still lie in their hands for further development.

PAUL S. CLAPP, *in "The Electrical Industry and National Progress."*

IF the personality of the employee is so important, then upon what is this personality based? What causes one employee to make a good impression upon the customer and another to make a poor impression? What governs the conduct of the employee as he stands face to face with the customer? If so much depends on this conduct, is it possible to, in any way, control or standardize that conduct?

The questions are answered by C. E. MICHEL, *in "Service Suggestions."*

THE method of treatment of one of our greatest natural resources, the shade tree, by the utility is proof to us, who may be a trifle emphatic in our desire to perpetuate shade tree growth, that there are yet great material organizations which are not inclined toward the fallacious opinions rampant today that progress is a thing to be measured in material gain.

C. G. CODDING, *in "The Philanthropy of Tree Clearance Programs."*

It has been said that the State Committees and the State Information Bureaus have been furnishing material to the newspapers and concealing its source. This is not an indictment of the public utilities—it is an almost comical indictment of the average newspaper editor—either that or downright libel, when sinister "influence" is implied. Every publicity man and every newspaper man knows the utter futility of sending any kind of a statement to a newspaper without giving its source. The person who does so with the hope of getting the statement printed is unsophisticated to a high degree. The editor who would print such a statement, without having some one to "hang it on," would soon find himself operating an elevator or cleaning up the city room after the staff had finished its work and gone home.

BERNARD MULLANEY, *in "Public Utility Information Bureaus and Why."*

COOPERATION between the National Electric Light Association and the Bell Telephone System has brought about a mutually acceptable code of principles that stands as a basis upon which adjustments of problems arising through inductive interference can be effected. A few practices have already been agreed upon. These practices, however, do not contain quantitative values which are important to their direct application in the field. Our problem now is to expand these practices to cover all our needs, and to do this we must know the extreme limits to which coordination measures can be carried out in both systems.

H. L. WILLS, *in "Development and Research in Inductive Coordination."*

What profit it to scientific men, physically and mentally, to develop and enrich civilization if they remain passive toward the higher arts and the humanities?

W. H. ONKEN, *in "The Louvain Memorial and What It Suggests."*

DOESN'T this steady increase in manufacturing, business, amusements, and general activities of all kinds represent nothing more or less than a steady demand for an increase, or, rather, an improvement, in standards of living? If the answer to these questions is "yes," then the increase in demand for electricity represents not only a statistical prosperity, but a psychological prosperity which, after all, may be the only real prosperity.

Electric News Items Section.

IN this plant will be found the hopes and aspirations of thousands of men who have spent their days in laboratories and in research to the end that the giant electricity, which has slumbered in the bosom of the universe for so many ages, be tamed and harnessed to serve mankind.

A. W. ROBERTSON, *in "On the Occasion of a Ground Breaking."*

***"In the busy days of a great business a matter which is not forcing itself upon you is put aside for other matters."*—JOHN F. GILCHRIST.**

THE PRESIDENT'S PAGE

Why We Advertise

ONE cigarette company is said to be spending eighteen million dollars a year for advertising. Do you suppose it is doing it to control the editorial or news policies of the papers? No. It is doing it to increase consumption of the cigarette, which will reduce the cost of the cigarette. The consumer will get every bit of the advantages, and more, too, of every dollar spent.

We are a business institution. We are competitors with other producers of power. There is still a great deal of missionary work to be done in making even the domestic use of electricity universal. Our problems and motives are the same as those of other advertisers. We desire to sell more electricity, and advertising is one way to help do it. The electric light and power companies manufacture a commodity, which, in recent years at least, is on a mass production basis, with all that that connotes. Advertising by central stations, by manufacturers of electrical apparatus, by the financial houses that handle our securities, and, yes, by our customers, has helped to place it there.

We have no right to throw our money away or waste it. We are justified in spending our money only for business reasons, within our own judgment, of course. For every dollar spent on advertising our customers get manifold returns, for it helps us to increase the consumption of electricity and thereby reduces the cost of production and distribution, which in turn is reflected by lower rates. If it did not do that it would not be justified. That is the basis on which we, and everybody else, advertise.

P S Arkwright
President.

NATIONAL ELECTRIC LIGHT ASSOCIATION

A Voluntary Organization of Companies Engaged In, and Individuals Affiliated With, or Interested In, the Electric Light and Power Industry: "Organized to Advance the Art and Science of the Production, Distribution and Use of Electrical Energy for Light, Heat and Power for Public Service"

N·E·L·A·
BULLETIN

Entered as Second Class Matter Jan. 28, 1914, at the Post Office, New York, N. Y., under the Act of March 3, 1879.

Published monthly at 420 Lexington Ave., New York, N. Y., by the

National Electric Light Association

P. S. Arkwright, *President*
Paul S. Clapp, *Managing Director*

Subscription price of the N. E. L. A. Bulletin, in United States, is $3.00 per year to members and non-members. Half price to colleges and libraries. Single copies, 25 cents. Foreign subscriptions, $4.00 per year to non-members.

Orders should be made direct to the National Electric Light Association, 420 Lexington Ave., New York, N. Y.

The closing date for the N. E. L. A. Bulletin is the fifteenth of the month preceding the month of issue. Material intended for publication must be in the hands of the editor by that date to insure publication the following month.

Manuscripts and correspondence relating to the N. E. L. A. Bulletin should be addressed to the Editor, N. E. L. A. Bulletin, 420 Lexington Ave., New York, N. Y.

The National Electric Light Association does not assume responsibility for nor necessarily endorse, or approve, statements made by individual contributors.

Code address of the National Electric Light Association is "Nelap," Bentley's code.

Facts on Government Ownership

Of more than passing interest to the electrical industry is the new edition, 1928, of "Government (Political) Ownership and Operation and the Electric Light and Power Industry," which has just been made available at the headquarters of the N. E. L. A. The book represents the compilation of a vast number of authentic facts and figures on the municipal and government operation of public utilities. It is written for every one concerned with the industry and its relations to the country and the people whom it serves.

The more than five hundred pages are devoted to reviewing the relation of government to business and the origins and developments of the electrical industry. A large number of quotations from prominent industrial leaders and government officials are given and the last chapters are devoted to chronicling the large number of municipally operated power companies that have turned to private operation. The book is a record, in a measure, of the accomplishments of the privately operated electric light and power companies of the country and it deals in an authoritative and conclusive manner with a problem that not only confronts the industry in some parts of the country, but is also a vital issue in government.

The Field for Electric Water Heating

At a recent meeting of the Merchandising Bureau of the Commercial National Section, Norman T. Wilcox, chairman of the Electric Water Heating Committee, estimated that an annual gross revenue of over $100,000,000 of electric water heating awaits development.

The committee has set as a serious objective the stimulation of active interest in water heating, by pointing out and demonstrating the investment limitations and possible revenues incident to an understanding development of the water heating load. It is the intention of the committee, through tests already made and others that are to be made, to demonstrate the peculiar advantages as well as limitations of the water heating systems already developed, and the benefits to be derived by a well-applied control, such control to be consistent with the utmost of customer satisfaction, and not hedged about with annoying limitations.

Much of the information now at hand, because of the lack of definite data as to time of use and quantities affected is not satisfactory for the determination of diversity of this type of load. Since the diversity has a decided bearing on the total investment required, for a given connected load, it is of prime importance in determining the legitimate rate for this type of service. The committee is therefore now undertaking a comprehensive survey of the field.

The success of this survey will depend upon the cooperation received from member companies as it is contemplated that all tests will be made under their direct supervision. The data which will be of utmost value to the committee may be obtained directly from printometric records and should preferably consist of a number of simultaneous records for a group of similar heaters. The burden placed on the individual company will not be great, but the results of the combined efforts of the individuals will furnish the committee with invaluable data and it is therefore urged that the member companies heartily cooperate with the committee in the tests and field work.

Twice as Strong

"What is the major influence in forming the customer's opinion of us?" Almost anybody can give the answer. One group of companies after an extensive investigation, based upon scientific method, confirmed what has been accepted as an axiom of the utility business. It was found after analysis that the impression left by personal contact with employees was twice as strong as all other factors combined in determining the customer's estimate of the utility's service.

This month's Service Suggestions tells how one company working upon this premise instituted a course of employee training which was met with enthusiasm by employees and resulted, according to the author of the article, in "Improvement in dozens of indivi-

The Electrical Industry and National Progress

By Paul S. Clapp

THE rapid stride forward which this country has made since the war is without parallel in all history. No nation in a corresponding period of time has made such rapid advances in their general standard of living and well-being.

We have made remarkable gains in enlarged productivity, in more effective utilization of materials and natural resources, in wiser expenditure of effort, in better organization and management, in acceleration of conduct of business, in expanded world relations, in education, in better methods and processes, in better homes, in scientific invention and discovery, and in quicker translation of their findings into every day use. There has been wider diffusion of wealth and more general participation in the good things of life.

All of the people of the country have contributed to and share in this accomplishment. Likewise all business and all industries have contributed to it. It has been a great national effort, in which the electrical industry has played a leading part.

The Country's Electrical Development

Electrical development in the nation far outstrips population growth. Since 1912 the population of the country has increased 25 per cent; generation of electricity has increased 615 per cent; the number of people living in electrically wired homes has increased 470 per cent; and the number of customers receiving service has increased 510 per cent. Consumption of electricity has increased twenty times faster than population.

Mr. Clapp—Managing Director of the National Electric Light Association

The people of this country use as much electrical energy as all the rest of the world combined. The generating capacity operated is four and a half times greater than the generating capacity in any other nation.

In 1882, when Pearl Street Station was opened in New York City, heralding the birth of the electric light and power industry, the lamps which it was to light were carried across the Hudson from Mr. Edison's laboratory in a single bushel basket. Today, to meet the needs of lighting alone, there must be manufactured 1,000,000 lamps in a single day. A bushel basket of today's lamps will give five times as much light as the original basketful, and at about one-third of the cost.

Interconnected Systems the Source of Power

With the rapid development since the war in high voltage transmission, and improvements in power generation a fundamental change in the character of the nation's essential power supply has occurred. It is based upon the development of the interconnected electrical system, and shares the general business trend toward large scale operation with attendant economies. Interconnection, the fundamental change, is, briefly, mass production and distribution of electric power. Interconnected electrical systems provide a source of power supply at once reliable and adequate, available over wide areas, day and night, flexible, and at low cost.

Nation's Power Increases Are Electrical

The nation's power equipment, if we except steam railroads, automobiles and draft animals, consists essentially of that installed in factories, mines and quarries, and in public utility powerhouses. The total installed in these three groups is now 60,000,000 h.p. This may be looked upon as the main power supply directly engaged in manufacture and the productive processes.

A critical and significant turning point has been reached in the nature of new additions to the nation's power equipment, as represented by these groups, and is emphasized by the fact that local installation of boilers and engines in factories, mines and quarries, has come to a standstill. Since 1919, 14,500,000 h.p. or nearly 32 per cent has been added. This stupendous increase in the power equipment of the nation has been in the power-house of the electrical industry. It marks the definite trend toward electrification.

Electric Power and the Worker

Each American worker in 1900 was directing 2.11 hp. In 1925, the average available to each worker had doubled by increase to 4.27 hp. The American worker directs more power than the worker of any other country. Enlarged use of power has contributed largely to increased output per worker, which, in turn, has given to the American worker the largest real wage he has ever enjoyed. It has decreased his hours of labor, it has given dignity to labor, it has reduced industrial fatigue and accidents, it has improved the conditions under which he works, and it has enabled the American worker to participate in a general advance in well-being never before equalled. According to the Department of Commerce* between 1919 and 1925, the output of factories on a quantitative basis increased 28½ per cent; the number of workers was less by 8 per cent; thus showing a gain in output per worker of 40 per cent. The average earnings per worker in 1925 were twice as much as in 1914. His present wages, adjusted for buying power of money, on a 1914 basis, gives him a 35 per cent increase in real wages.

Many factors have contributed to this: education and research, increased use of capital, mass production, elimination of waste, favorable attitude of workers toward machinery. Electricity had a large part. Between 1919 and 1925, six and one-half million hp. was added to factory power equipment. This total increase was in electric motors. There was no increase in local installations of boilers and engines in factories. The volume of power supplied to industry by the utility companies is six times pre-war. Factories are electrifying. Electrification varies in different industries. In some it has already reached nearly 100 per cent. Taking factories as a whole in this country, they are 75 per cent electrified, with two-thirds of the energy supplied from interconnected systems. This degree of factory electrification is greater than that of any other country; Germany has 66 per cent; England, 48 per cent.

Economic Effects of Factory Electrification

This factory electrification has far-reaching effects upon the entire economic structure of the country. I shall discuss certain of these effects.

Release of Capital for Factory Expansion

The installation of electric motors by factory operators and the purchase by them of electric power from the interconnected electrical systems releases to the operators enormous sums of money which would otherwise be needed for investment in boiler and engine equipment. A careful estimate shows that the amount so released in the last seven years amounts to at least one-half billion dollars. This money has been made available to factory operators for investment in other phases of their business where it can often turn over as much as four times in a year. It has greatly accelerated and facilitated factory expansion. The investment in prime movers, on the other hand, has become a part of the investment of the electric light and power industry where it does not turn over more rapidly than once in five years. Large increases in the plant investment of the utilities have been necessitated.

Fuller Coal Utilization

The electrification of factories also has a very important bearing upon the quantity of coal consumed to produce power for factory production. The average factory plant will burn from 3 to 7 pounds of coal for the generation of the equivalent of a kilowatt-hour of energy. The central station plant will burn 2 pounds of coal, or less, to generate the same energy. It is a matter of vital difference where the coal is consumed. The burning of coal in the central station plants of the utilities, instead of in the isolated factory boilers, has resulted in the savings of millions of tons of coal. The estimate of this saving in the single year 1927 is 40,000,000 tons, or more than one-fifth of the total tonnage used by factories.

Fuel Transportation Simplified

This shift in the burning point of coal also has an effect upon transportation, for not only has there been a decrease in quantity of coal required in factory operation, but the transportation of coal has been greatly simplified. Instead of moving to a large number of factories scattered over wide areas, coal now travels more directly in large quantities from the mine to the central station plant. This represents an enormous release of transportation facilities.

Better Factory Location Possible

The provision of these electrical power supplies, adequate and reliable as they are, over wide areas, is also having an important effect upon the economic location of factories. The factory operator looking about for a place to locate is now relieved from going to a power source with his factory. He is free to consider other factors, such as transportation, markets, raw materials, and labor, etc., which enter into factory location. He is able to get a more economical and sounder business location of his factory. The utilities have been active forces in their communities in attracting industries and facilitating expansion.

Diffusion of industry has been made possible, and is rapidly progressing, with benefits both to industry and agriculture. Factories operated in the midst of agricultural areas benefit the farmers. The wealth created lowers tax burdens; increases money available for public improvements and education: perishable farm products become marketable; stability is improved.

Advances in Art of Power Production and Delivery

The electrical industry has made outstanding contributions to the art of power production and power delivery which are shared by all. To the electrical industry are due the major advances since 1890—the reciprocating engine pushed to highest limits of performance; the steam turbine, concurrently with the high speed electric generator, steadily increasing in size and improving in performance; higher pressure, larger boilers, and better fuel utilization; the mercury boiler and turbine; advances in water wheels and hydroelectric development; electric transmission freeing the prime mover from need of mechanical connection to the machines its actuates.

---

*Commerce Year Book, 1928.

Effective Utilization of Natural Resources

The use made by the electric industry of the natural resources—fuel and water—intrusted to it is a record of effective, efficient, and economic utilization of these resources.

Fuel—Coal, Gas, Oil

Concurrently with the increase in size of public utility power houses and power house units, there have been decided improvements in fuel utilization. From 1919 to 1927, the amount of energy generated from fuels increased 107 per cent; the quantity of coal and its equivalent used increased only 19 per cent. In ten years the average amount of coal burned to produce a kilowatt hour has been pushed down from 3.2 lb. to 1.7 lb. In nine years, 1919 to 1927, the electrical industry generated 324.6 billion killowatt-hours of electricity from fuels. If the industry had made no improvements and had stayed at 1919 fuel efficiencies, the equivalent of 519.4 million tons of coal would have been required. This amount was decidedly reduced—376.5 million tons were actually burned. Improvements in fuel utilization resulted in equivalent saving of 142.8 million tons —an amount equal to one-fourth of the nation's entire coal production in 1928.

Water Power

There are developed and at work in the country 12,300,000 hp. in hydroelectric plants. Of this amount, 10,600,000 hp., or 85 per cent, is operated by the electrical industry; 5,000,000 hp. of which has been developed since the passage of the Federal Water Power Act in 1920. This total new development has been in the electrical industry.

Water power is no longer developed by the factory operator. There is an actual decrease in factory operated water power.

Development and utilization of water power is real conservation. These developments, as they have gone on, embodied the most advanced designs in hydroelectric machinery. This country has contributed more than any other country to the advancement of the art of hydroelectric development.

Through interconnection of hydroelectric plants and their interspersion with steam plants, the difference in time of seasonal flows of different drainage areas has been taken advantage of and more hydroelectric energy has been obtained from the group than would have been possible if they had been operated singly. It may be said, almost literally, that not a drop of water goes to waste.

Federal Water Power Act

We hear a great deal about grabbing water power. Those who talk about grabbing water power show lack of knowledge of the Federal Water Power Act and of the Federal Power Commission, and of the safeguards therein provided for the public. Every hydroelectric development on navigable streams and within Federal jurisdiction is passed upon by the Commission as to the character of construction, as to capital charge which will be allowed, and as to the rates of return upon the money therein invested. It must not be forgotten that under the provisions of the Federal Water Power Act title to these water power cites is conserved to the public. There can be no exploitation—there is no exploitation; there is only sound development for public service.

Changed Situation as to Water Power

We must revamp many of the viewpoints with regard to water power which have long existed.

Last year, only 39 per cent—and it was a very high year—of the energy requirements of the country came from water. Our principal dependence is on steam, and the advancement in the art of steam generation is so rapid that there is already keenest competition between steam and hydro power.

Efficiencies of hydroelectric machinery have reached a high state of performance—well over 95 per cent. In spite of the remarkable improvements in steam generation, the best over-all efficiencies are about 30 per cent, which indicates the enormous field of future possibility where research and engineering can work for further advancement.

Many of the large undeveloped water powers are far removed from market. Seventy-five per cent of the potential water powers of the United States lie west of the Mississippi, whereas 79 per cent of the power load of the nation lies east of the Mississippi. These are all contributing factors toward a retardation in the rate of water-power development.

Without going into the technical and financial problems involved in hydroelectric development, it can be pointed out that the cost of the power at the switchboard is not the full story. It constitutes probably less than 20 per cent of the cost of the power as delivered to the domestic customer's premises. Costs of transmission, distribution, and of rendering the service make up the large proportion of the cost, as is the case with most commodities. We do not compare the cost of beef on the hoof in Kansas with a steak at a New York hotel.

Local Character of the Industry—Interstate Power

With the growth of interconnection and the construction of high-voltage electric transmission lines, there has also been created a misconception as to the quantity of electric power involved in interstate transmission. Studies by Harvard University for 1927 show that of all the electrical energy generated, less than 10 per cent—actually, 9.6 per cent—at any time crosses state lines. More than 90 per cent of the total is locally generated and locally consumed.

The foregoing gives an all-over picture. It tends to exaggerate the size of the interstate power movement. An analysis of the 9 per cent sector of power which is in interstate movement shows that half of the total amount occurs in nine specific major transfers of energy, such as the Keokuk Dam, Cahokia Steam Plant, Conowingo Plant, etc. With these major transfers of energy across state lines eliminated, the total amounts in interstate movement in the entire country represent only about 4½ per cent of all energy generated. This gives a clearer concept of the factual situation with regard to energy transfers across state lines.

The number of transmission lines crossing state borders, of which there are about 500, is not an adequate test of the interstate implications of electric power. These crossings, in a large proportion, come about in the ordinary process of borrowing and returning power. Maps of interconnected electrical systems look somewhat like railroad maps. Perhaps from this arise erroneous conclusions that these two utilities are similar in their interstate implications. This is not the case. They are totally different in this regard. Whereas from 70 per cent to 80 per cent of all goods loaded in cars by steam railroads is transported across several states, less than 10 per cent of the electric power generated ever crosses a state line.

The Nation's Electrical Bill

The electrical bill of the nation is 1.8 billion dollars annually. This is for all electricity suppied to 19,000,000 homes; for the power turning out over one-half the nation's factory output; for much of the power in electrical transportation; for farm electricity, and for all other uses. Light alone is perhaps worth this whole amount to the people, in increased comfort, safety on streets, saving of eyesight, better working conditions, better space utilization, acceleration and facility of business, and larger productivity. The bill is small compared with other national expenditures. We spend more than this for cosmetics and confectionery.

Power is a relatively small item of cost in manufactured goods. Omitting items essentially based on power, such as electric-chemicals, power is less than 2 per cent of the cost of goods ready for delivery at the factory. The power in the same goods as paid for by the consumer is less than 1 per cent. Taxes alone are more than this.

Electricity takes barely 1 per cent of the average housewife's expenditures. It is the cheapest essential in the "cost of living," and the smallest item in the housewife's expenditure. It costs her 18 per cent less than before the war, while everything else—her rent, food, clothes—have found new higher levels.

Electricity for All the People

An outstanding characteristic of this wonderful electrical development we are having is the fact that it is becoming universal; the service is not for a few alone, it is becoming available to all the people. A democracy, after all, does not consist in charters and bills of rights. A democracy is built upon equal opportunity and common sharing in the benefits of the telephone and the radio, of schools and other blessings. So that the universal use of electricity by rich and poor, high and low, in big town and small town alike, is a great contributing factor to this fundamental of democracy.

The Spread to the Small Town

The high voltage transmission spreads from town to town, reaching out like a pioneer. In five years, the electrical industry has extended electric service to 4,000 towns and villages which before had no service. Not only has there been extended to them electric service, but there has been extended to them 24-hour reliable service of the same quality that the city dweller has. Every city of 5,000 population and more has electric service; 97 per cent of communities between 1,000 and 5,000; 50 per cent of communities with between 250 and 1,000; and 25 per cent of all hamlets with less than 250 population. Such is the universal character of the service.

Contributions to American Home Life

In just seven years the industry has connected up to receive for the first time the benefits of electricity, 9,000,000 American homes, representing the hearthstones of some 40,000,000 American boys and girls, men and women. Some 19,000,000 homes are now served.

Last year, there were added one and a quarter million homes and certainly to these people for the first time came electric light, and there has been opened to them the whole gamut of household appliances which will mean increased comfort in the home and decreased toil.

Electrification of Farms

The electrical industry is aggressively at work in extension of its service to farms. It covets the benefits of electricity for the farm home—and none would benefit more—and for the farmer in his work. Intensive experimentation and research on groups of electrified farms are under way in 24 states. A national research project for rural electrification was established in Maryland last year. The same zeal which successfully accomplished electrification of manufacturing industries, such as steel, paper, etc., is being focused toward farm electrification.

Farms conected with electric power lines have increased 125,000 in three years. Some 350,000 farms now receive central station electric service. Although this is a small proportion of the total number of farms in the country, it clearly indicates the rapid progress being made, and gives assurance of future accomplishments.

Railroad Electrification

The growth in population of the country has enormously increased congestion at the terminals of our great railroads, both passenger and freight. Electricity has commenced to aid in the solution of this problem of congestion. It has facilitated wonderful developments, such as the Grand Central and Pennsylvania Terminals in New York City, and such as the Illinois Central in Chicago. It has enhanced property values. It has opened up whole areas in those cities to an enriched use. Much attention is now being given to main line electrification. In no country does transportation equal that provided by our railroads. Our railroads will make that use of electricity consonant with soundest development.

I have endeavored to interpret some of the contributions the electrical industry is making toward business stability, progress, and security and enrichment of home life. It is upon this foundation that, as a people, we will build toward attainment of the rich moral and spiritual values which we now enjoy to such large degree and to which we aspire in increasing measure.

The Future Challenges

So far, I have indicated what has been done. We have just commenced. Enormous fields of opportunity lie ahead of us. Less than two-thirds of the population live in homes using electricity. We should not be satisfied until we have extended this service to all of the people. Less than one-half of the homes now wired use anything beyond lights and a flat-iron. We should not be satisfied till it becomes possible for every home to buy and utilize the equipment which electrical science has and will make available. This is the largest single field of opportunity. Less than one per cent of the country's railroad mileage is electrified and but few of its terminals. The full utilization of electric power by factories is far from being accomplished. The lighting of the nation's network of highways and airways is just commencing. Radio broadcasting and the home movie give us but a faint opening of the curtain as to what future invention and discovery may bring forth.

Never has an industry, or a group of men connected with an industry, been able to look back upon a scene of accomplishment equal in contribution to the people of their country. No industry or group of people connected with it has ever been privileged to turn about and look forward with such hope and such confidence to the enormous contributions which still lie in their hands for further development.

We are concerned in the physical problems, in the financial aspects, in the economic interpretations—but of much greater moment is our feeling that, in the span of time allotted to us for the expenditure of our effort and the expression of our hearts, we are contributing to the forward march of this great country.

Public Utility Information Bureaus—AND WHY

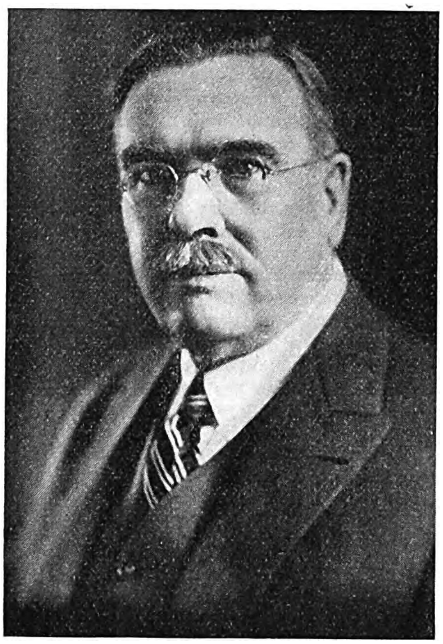
By Bernard J. Mullaney

FOR nearly a year the so-called State Bureaus on Public Utility Information have borne the brunt of the investigation into the alleged methods adopted by the light and power industry to combat municipal or government ownership and operation of public utilities which is being conducted by the Federal Trade Commission.

The implications in the manner in which the testimony of certain witnesses has been brought out, the exhibits which have been introduced entirely apart from their context and the accounts of the various hearing as reported by certain portions of the press, are obvious. The public has been led to understand that these Bureaus, as operated by managers or state directors, have been furnishing sinister propaganda to the newspapers without indicating its source, and that editors have been either innocently publishing it without dreaming that the public utilities themselves were its sponsors, or have been publishing it in response to improper or corrupt "influence;" that the bureaus have been furnishing material for use in the public schools intended to give both teachers and pupils an entirely erroneous conception of public service operation, again without indicating its source; that speakers have been furnished various kinds of civic organizations which presumably haven't even a speaking acquaintance with such a person as a public utility official; and doing all sorts of other things designed to keep the public satisfied with service of a much poorer quality than that to which it is entitled and at a price much higher than it should be asked to pay.

Suspicion Comparatively Recent

While I am familiar with the work of most of the state information bureaus, many of which are modeled after the one in Illinois, it is my intention to approach the subject in this article entirely from the standpoint of my own nine years' experience as Director of the Illinois Committee on Public Utility Information.



Mr. Mullaney is Vice-President of the Peoples Gas, Light and Coke Company, Chicago. He was largely instrumental in the formation of the Illinois Committee on Public Utility Information and has been its Director since its organization in 1919, *as the pioneer public utility information bureau. This article originally appeared in the Industrial Digest.*

I have no reason to believe that, except in isolated cases and incidents, other committees have not operated in much the same way. I wish to emphasize particularly the fact that our committee has been in existence nine years and that only during the past year has any question been raised as to the legitimacy, not to say the praiseworthiness, of its efforts. During these nine years every newspaper editor in the State has known of its existence and has never been in any doubt as to the source of the material which it has sent out from time to time, and it has never issued a line of so-called propaganda, to newspapers, teachers or anybody else, that was not conspicuously labeled.

The Illinois Committee was set up in 1919 "to make the public better acquainted with the fundamental economic facts of the public utility industry." Surely there can be nothing particularly reprehensible in such a purpose. It is a procedure which is being followed not only by every national industry in the United States but by thousands of individual manufacturers and other business enterprises. It is not only the basis of all advertising, whether direct or institutional, but it is also the basis of all publicity, whether governmental or private. It is anybody's and everybody's prescription of "pitiless publicity" and it has high acclaim—frequently—as when the late Judge Gary, of the United States Steel Corporation many years ago adopted the policy of taking the public into his confidence with regard to corporate affairs. As the doing of this has progressed, it has naturally included illustrative and expository use of collateral facts and circumstances.

There was a very good reason, in the spring of 1919, for the organization of the Illinois Committee. The public utility industry of the country generally was in difficulties. Labor, material and other operating costs had been doubled and trebled. Rates remained fixed and stationary at or near pre-war levels. Earnings were, in consequence, adversely affected; often disastrously.

Investor Confidence Essential

Utility development was all but stopped. The war had interrupted plant and equipment construction. This deficiency, plus the additional plant and equipment needed for new service demands, could not be supplied without new capital. The new capital could be obtained on feasible terms only by restoring credit and rewinning investor confidence on a basis of fair rate readjustments.

Most companies in all branches of the utility industry—gas, electric, telephone, electric railway, etc., were crippled. Some were being strangled. By March 15, 1919, upwards of 70 street railway systems were in receiverships and many others were near it. The street railway situation reacted upon all other utilities, correspondingly increasing their difficulties, and the general utility situation was, consequently, disturbing the entire financial and economic structure of the country.

President Wilson's cabinet (he was in Paris at the Peace Conference) found the situation grave enough to be taken up in his absence, to be discussed with him by cable, and to receive attention. The financial steadiness of the country was involved.

In Illinois the public utility companies faced a need of 75 million to 90 million dollars of new capital a year for at least five years to catch up with their new plant and equipment requirements. The state regulatory commission was slow to act, and such bodies always will be—inevitably—while government is political. When the public is unaware of the economic reasons for rate readjustments, it opposes them, and regulatory bodies cannot be expected to ignore such opposition.

In these circumstances the responsible managers of Illinois utilities determined to take their case directly to the people. They believed, as events proved true, that public understanding of the facts would end blind opposition to fair rate readjustments and would generally improve relations between companies, customers, regulatory bodies, and the public. Their double objective was to protect the existing property of their stockholder-owners and to hasten the plant extension and service improvements which the public interest was demanding.

Never Any Secret

This, then, was the genesis of the State Committee on Public Utility Information and the State Bureau of Public Utility Information operated by it. There has never been any secret about it and never any misunderstanding on the part of the public. Without public confidence and without a public understanding of the many financial and operating problems of the public utilities, there can be no progress in the industry. The meaning of this can be best understood when it is realized that the light and power industry alone is now requiring approximately 800 million dollars a year of new capital with which to meet the demands for additional service being made upon it throughout the country.

SHORT SERMONS

Just what is right in all cases we cannot foresee. We make mistakes. We try to correct them. By and large, looking over the quarter century with which I have been familiar, I am pleased with the rapid progress which we are making toward the right in business. We are not perfect and never shall be, but we are training young men with a sense of these great responsibilities, and we are providing them experience from our own mistakes.

As time goes on I feel that the right in business will more and more prevail. The larger business becomes the more scrupulously careful the administration of it will be. We have had much difficulty with questions of technical competence and moral responsibility in the offices of Aldermen, but we have had practically none in the great office of President of the United States. Somehow, as responsibility increases, men are found big enough to meet adequately the great questions of right and wrong which come to them. So I welcome big business and big responsibilities, not in the fear that it will make business wrong, but in the hope and belief that it will make business right.

—*Owen D. Young.*

* * * *

We may be sure that any opposition to industrial advancement which is made by men who see political advantage in it will fail to recommend itself to the common sense of the American people. The record of electricity supply in the United States is one of continuously better service at continuously lower rates. I believe that that record can be maintained and that it will be maintained by the men who made it, not by political meddlers.

—*Henry Ford.*

* * * *

If your goods are acceptable, or your services useful, you will receive a profit. If, on the other hand, your fellow-creatures decide (wisely or unwisely, it makes no matter) that they do not want your goods, or that they will get on better without your services, then you will make a loss. The profit-making system is the only one under which the consumer can be perfectly sure of obtaining the article he wants—any other scheme can only mean that he will have forced upon him the article which somebody else thinks he ought to want.

Working for a profit on an individualistic system also ensures that the people who receive the goods are the same as those who pay for them — a very important point. Based upon the interests of the consumer, it is the only system under which the consumer can ever stand a chance. We can make no money, we can do no good, unless we can persuade others to accept our services at the value that we and they jointly place upon them.

—*Ernest J. P. Benn, in "The Confessions of a Capitalist."*

Although the National Electric Light Association, the national organization of the light and power industry, has no control over these State Committees and State Bureaus, it has always urged upon them the policy which the Illinois Committee adopted for itself from the day of its organization. This is, to deal only in facts and to leave out of the picture anything which might seem to be political or controversial. When opinion or argument has been handled, it has been by direct quotation of a responsible person, organization or publication. The facts with which the committee has dealt fall naturally into three classes:

1. The details of utility operation and the inter-related economics of operating costs, rates, service, financing, fixed charges and return to investors, as accentuated by war consequences.

2. The fundamentals in which the utility industry differs generally from other industries and business, as: Regulation and the details thereof, fixed selling prices, new capital needs, high ratio of capital investment to turn-over, etc.

3. Origin and development history of the industry in its various branches, and its present stature and significance as the largest industry in the country, next to agriculture and railroads, with some five million direct security holder investors and many more millions financially interested indirectly, as owners of fire and life insurance policies, bank accounts, etc. Insurance companies, banks and other corporations are large holders of utilities' securities.

Means Used in Getting Facts to Public

What means has the Illinois Committee used to get the facts across to the public? It has made them available to anybody and everybody who might find them usable—writers, speakers. publicists, educators, public officials and, of course, newspapers and other periodicals. In so doing the public utility industry of Illinois has revealed itself and its workings to a degree never exceeded, if ever equaled, by any other industry. Nobody has been solicited to make use of this informative and expository material, in writing, speaking, printing or otherwise. It has been made available always, on a take-it-or-leave-it basis. It has had to win its own way by force of its inheritent importance or interest.

It has been said that the State Committees and the State Information Bureaus have been furnishing material to the newspapers and concealing its source. This is not an indictment of the public utilities—it is an almost comical indictment of the average newspaper editor—either that or downright libel, when sinister "influence" is imnewspaper man knows the utter futility plied. Every publicity man and every of sending any kind of a statement to a newspaper without giving its source. The person who does so with the hope of getting the statement printed is unsophisticated to a high degree. The editor who would print such a statement, without having some one to "hang it on," would soon find himself operating an elevator or cleaning up the city room after the staff had finished its work and gone home.

School Pamphlets

It has been said that the State Committees and the State Information Bureaus have distributed hundreds of thousands of pamphlets in the public schools designed to "pollute the source of education" and to instill in the minds of both teachers and pupils the idea that government ownership and operation is an exceedingly bad thing for the public generally, and socialistic in its tendencies, while private ownership and operation is the only sound policy to be followed by the American people.

Even the most superficial examination of these pamphlets—which I frankly admit have had very wide distribution, but only because they have been requested by school authorities all over the country—will show the utter absurdity of such a charge. It is exactly the same sort of material which will be found in the modern supplementary reader, except that in most cases it is more accurate, more detailed, better organized, and is written in a more interesting style. Much of it is so adaptable that it can be used in connection with the teaching of Geography, History, Civics, Popular Science or English, and it cannot help but give added zest to lessons in these subjects.

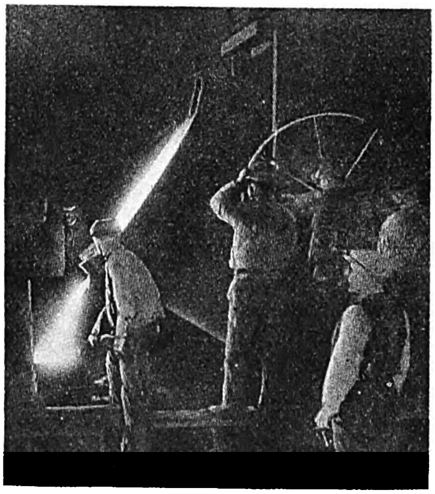
As to the ideas which these pamphlets may instill in the minds of the teachers and pupils, they are nothing more or less than factual information dramatized to make them impressive to both teacher and pupil. The preaching of any particular creed, social philosophy, or industrial policy has been carefully avoided. It is only by the widest stretch of the imagination that one could interpret any particular statement as an effort to condemn government ownership or to eulogize private ownership and operation of public utilities.

Educators Requested Material

The furnishing of this material was, in effect, initiated by educators and not by the public utilities. Superintendents, principals and teachers, from time to time, had requested first-hand information concerning these public services. This eventually led to the preparation of the pamphlets. In no instance are they distributed direct to the pupils, except upon individual request; the pamphlets are first submitted to the school authorities and, if approved, furnished free in such quantities as they may order.

Public utilities, in some localities, have been furnishing the public schools with this service for years without criticism, and in doing so they have done nothing which is not being done by almost every other American industry. There is this difference, however: the public utility pamphlets have been more strictly factual and less "propagandaish" than most of the others. For example, a survey of the public schools of Cleveland, Ohio, showed over 2200 separate items ranging from pamphlets to books, introduced into the schools by every conceivable industry and including all sorts of writings that were little more than straight advertising matter. Of these 2200 items, the light and power industry was responsible for just three pamphlets.

It has been said that the State Committees and State Bureaus make surveys of textbooks in use in the public schools, the implication being that the surveys were made for the purpose of "censoring" these books in order to eliminate from them anything which might seem to be inimical to the interests of public utilities. In Illinois we made a very complete survey of these books and the results were highly interesting. I can only say that I would advise every national industry to do the same thing if they wish to make sure that the coming generation is not being taught strange and curious things about their various activities.



Some Survey Results

The survey brought about some interesting disclosures. For example: plenty of government ownership propaganda in public and school libraries; little or nothing on the rise and development of utility service; practically no book or pamphlet literature on public utilities comparable to that available on banking, railroads, iron and steel, salesmanship, advertising, and so on; school textbooks utterly deficient and obsolete in relation to this great and pervasive industry.

Many of these textbooks had no mention of regulation, as now applied in nearly all states; no mention of theory and practice in utility operation as exists today. They discussed franchises, financing, rates, service and regulation in the terms of a dead and buried past. They expressed a distinct bias in favor of government ownership and they sometimes used language that would have been prima facie libelous if applied by name to persons or companies. And yet the critics of the light and power industry insist on the teaching of things to children which are not true or which, while they may have been true 25 years ago, are no longer true, and all because it is the industry itself which has attempted to call attention to many glaringly inaccurate statements about its own affairs.

The State Committees on Public Utility Information are rendering a very distinct service to the public and to the public utilities. One might write a book reciting economic facts of great significance to the people of the United States and which can only be given to them by the utilities themselves through some such agency. The right to continue this informative work is, now as always, unquestioned except by that small but vociferous group which seems to be engaged solely in an effort to tear down what other men have built. In a country less well informed they might be successful. It is the obligation of all business and industry to see that the country is kept informed.

An Invitation to Compete for the CHARLES A. COFFIN Medal

THE Charles A. Coffin Prize Committee of the National Electric Light Association cordially invites *all* electric light and power companies in the United States to make presentations of their accomplishments in connection with the award of the Charles A. Coffin Medal for 1928.

Under the terms of the Charles A. Coffin Foundation as established by the General Electric Company, the award will be made to that company which, during the year 1928, has made a *distinguished contribution* to the development of electric light and power for the convenience of the public and the benefit of the industry.

In order to aid the committee in its difficult task of bestowing the honors at its disposal, all companies are requested to list their achievements in accordance with the following outline:

Introduction

In the introduction there should be revealed the particular initiative, skill and enterprise which have been manifested in popularizing the general use of electrical energy and there should be emphasized the outstanding accomplishments of the company which, in the opinion of its officials, have done most to create and maintain a friendly public. As every operation of a Company bears upon its relation with the public, the section which has heretofore appeared in the Charles A. Coffin Foundation announcement, namely, "Public Relations" has been eliminated and each company is requested to reflect this fact in reporting on the three sections following. Mention should be made here of any one accomplishment and its related activities which the company considers entitled to the most consideration by the committee. Among the subjects, suggested for review by the company in its exhibit, are:

Section I—Accounting and General Administration Operations

Outstanding Accomplishments:

(a) Economies resulting from introduction of modern methods in customers' records and billing.

(b) Benefits which have accrued from improved collection methods.

(c) In improving personnel, office facilities and management and benefits which have accrued therefrom.

(d) In improving purchasing and store room records and operations.

(e) Improvements in capital records and development of statistical data.

(f) Results which have been obtained from educational facilities extended employees, building loan and similar operations, employee welfare work, group insurance, bonus plans and pensions.

(g) In improving institutional advertising.

(h) In improving transportation equipment and operations.

(i) In relations with the public and evidence thereof.

Section II—Commercial Progress

Outstanding Accomplishments:

(a) Promotional plans which have produced unusual increase in new customers.

(b) Promotional efforts to raise load factor of domestic consumers.

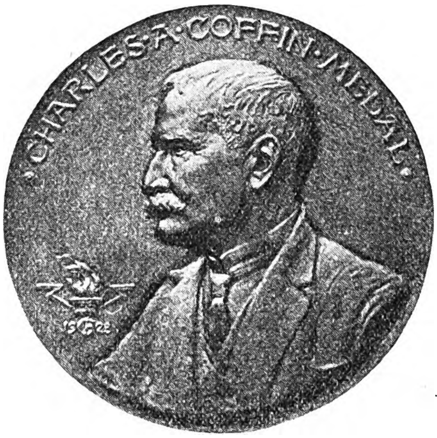
(c) Efforts and accomplishments in pioneering and popularizing electrical devices.

(d) Plans and results in selling greater use of light, heat and power in the commercial and industrial fields.

(e) Activities in farm electrification including the promotion of electric equipment on the farm and in the home.

(f) Methods used for coöperative promotion and selling of more adequate wiring, and electrical appliances, to develop better trade relations.

(g) Activities to develop better customer relations.



For having made a distinguished contribution to the development of electric light and power for the convenience of the public and the benefit of the industry, awards of the Charles A. Coffin Medal have been made to:

Southern California Edison Company for 1922.

Public Service Company of Northern Illinois for 1923.

Consumers Power Company for 1924.

Commonwealth Edison Company for 1925.

Edison Electric Illuminating Company of Boston for 1926.

Puget Sound Power and Light Company for 1927.

The Charles A. Coffin Medal is the most coveted prize bestowed within the industry and its award is a very great distinction to the company which succeeds in obtaining it. The exhibits are of great value and helpfulness to the industry as a whole and stimulate all of the companies to an even greater contribution to the development of the electric light and power industry. The exhibits made by companies in previous years are on file at the New York headquarters of the association and are available for inspection

Section III—Engineering Activities

Outstanding Accomplishments:

(a) In the field of generation, transmission, distribution, construction practice, etc.

(b) In improving overall efficiency as measured by kilowatts of system capacity per dollar of investment.

(c) In planning of system development.

(d) In improving reliability of service.

(e) In accident prevention.

(f) In relations with the public and with other utilities—telephone, telegraph, railway, etc.

It will be noted from the foregoing outline that the committee is principally interested in outstanding accomplishments resulting from a well developed plan. The companies are, however, requested to also give the comparative statistical data shown on the last page of the official invitation, which has been mailed to electric light and power companies.

While the exhibits and statements should relate to the year 1928, the committee will consider any achievement which, although the result of efforts of previous years, has manifestly reached its fruition during the past year.

The award of both the Charles A. Coffin Medal and the one thousand dollars for the employees' benefit fund will be made at the 1929 Convention of the National Electric Light Association.

The preference of the committee is that all presentations be made on standard typewritten sheets, accompanied by such exhibits as may be required.

All statements should be filed with the committee not later than April 1, 1929. These documents should be addressed to the Charles A. Coffin Prize Committee, National Electric Light Asciation, 420 Lexington Avenue, New York, N. Y.

(*Signed*)

P. S. Arkwright, *chairman, president of N. E. L. A.;* R. H. Ballard, *Chairman of Public Policy Committee;* Samuel W. Stratton, *President of Massachusetts Institute of Technology.*

The Louvain Memorial and What It Suggests

By William H. Onken, Jr.

PERMANENT friendship between the nations, an evangel preached with fervor by ardent souls in every country for a hundred years or more, is, we may surely hope, nearer accomplishment than ever before.

Such a prophecy may be unduly optimistic; but at least a basis can be found for it not so much in the reformation of governments or the absence of irritating factors similar to those which have produced war in the past, as in the enduring hatred of war engendered by that vast and terrible conflict that ended only a decade ago.

Indeed, one of the promising signs of the times is the fact that in every land the young man on whom the burden of fighting falls are losing the primitive impulse to "seek the bubble reputation in the cannon's mouth," and are satisfied to find opportunities to follow patriotic and heroic impulses while persevering in the paths of peace and in seeking to improve life rather than to destroy it.

However this may be, one thing is beyond peradventure: Between the United States and Belgium there will always be, as there always has been, profound peace based on mutual regard and unruffled by any diplomatic controversy.

BELGIUM, despite her two tongues and two races of Flemings and Walloons, is a small country. Only seven of our forty-eight states fall below it in area. Geographically, it is not quite the size of Maryland, and its eight million people are exceeded by the population of either New York or Pennsylvania.

But what a glorious history is crowded into that small territory, and what splendid activities are there embraced! From the day when Caesar recorded in his commentaries that of all the Teutonic tribes that withstood his legions, the Belgians were the bravest, to the day, so recent and yet so distant, when a startled world heard the guns at Liege roar defiance at the invader, valor has been Belgium's honor and her passport alike.

Mr. Onken is Senior Editor of the *Electrical World*. He was one of the delegates of the American Institute of Electrical Engineers at the dedication of the Louvain Memorial, held on the Fourth of July last year. As will be recalled, American engineers subscribed a fund for a memorial to our engineers who lost their lives in the war. This took the form of a carillon and clock erected in the tower of the library of the University of Louvain, Belgium. This address was made by Mr. Onken on Jan. 7 at a dinner held at the University Club, New York, and attended by fifty of the leading engineers of the country. The Committee on the War Memorial to American Engineers made its report on this occasion. At the dinner Prince Albert de Ligne, Belgian Ambassador to the United States, presented to Edward Dean Adams, chairman of the war memorial committee, the insignia of Commander of the Belgian Order of the Crown. In making the presentation Prince de Ligne expressed the gratitude of King Albert and the people of Belgium both for the good will of the donors and the choice of Louvain as the site of the memorial

Longfellow, singing of the belfries and the carillons that so enchant the traveller, tells how he—

> Beheld the Flemish weavers, with Namur and Juliers bold,
> Marching homeward from the bloody battle of the Spurs of Gold;
> Saw the fight at *Minnewater*, saw the White Hoods moving west,
> Saw great Artevelde victorious scale the Golden Dragon's nest,
> And again the whiskered Spaniard all the land with terror smote
> And again the wild alarm sounded from the tocsin's throat
> 'Till the bell of Ghent responded o'er lagoon and dike of sand:
> "I am Roland! I am Roland! there is victory in the land."

But Belgium's soil has been shaken many a time by the roar of strange cannon and the tramp of foreign feet. She has been sore tried, as it were, in the furnace of affliction and has drunk deep from the cup of adversity; but throughout it all she has maintained her spiritual life unblemished and undimmed.

MEN and nations have become great, not in proportion to the largeness, but in proportion to the smallness of their natural advantages. It is not size but valor that counts. The Persian hordes were driven back by ten thousand at Marathon and Greek culture and the world's civilization saved. William of Orange vanquished the mighty Philip of Spain when he tore down the dikes and buried the Netherlands beneath the waves of the sea. The Light Brigade at Balaklava will ever be remembered in story and song. And what of that great epic in the world's history fought on Belgium's soil? Not even the World War has dimmed the fame of Waterloo—the theme of Byron and Thackeray, Hugo and Stendhal and many another foreign author. A pall of blood and battle smoke hovered over Europe. Thrones tottered. The world wondered. Napoleon seemed unconquerable. Then came Waterloo and civilization resumed its joyful march.

Again in our day Belgium, through no fault of her own, was forced to become the "cockpit of Europe," and the fortress of the high fort of her walls was brought down, laid low, and brought to the ground, even to the dust. But to Belgium "the path of duty was the way to glory." From the East and from the West, from the North and from the South, whole nations rushed to her cause, determined to settle once for all whether might or right was to be leader of the world. Leige, Namur, Charleroi and Mons—what are they but the burial place of some of the noblest and best that Europe ever saw! But

> "They never fail who die
> In a great cause. The block may soak their gore;
> Their heads may sodden in the sun, their limbs
> Be strung to city gates and castle walls;
> But still their spirit walks abroad. Though years
> Elapse, and others share as dark a doom,
> They but augment the deep and sweeping thoughts
> Which overpower all others, and conduct
> The world at last to freedom."

And what shall be said of Louvain, from whose charred remains has risen a recreated city, glorious as the morning sun? Many of us have seen that city and the magnificent library which the Americans out of a free heart have erected there as a gift to the Belgian people. The building is a work of art, rivalling in grandeur the other great libraries of the world. It represents an ideal and the attainment within of that spiritual height which ennobles and endures. Petrified, indeed, must be the heart that catches none of the inspiration of such a temple.

OF a truth, "wisdom hath builded her house," and while the scholar furnished the means and the architect piled the stubborn stone into superb and stately proportions, it was the engineer who gave that magnificent tower its final majesty and rhythm, and lifted the environed human spirit toward that which transcends it.

That was an inspiration, you say? Aye, it was more than that. It was genius and labor combined and sanctified by a noble and god-like purpose. It furnishes one of the rare instances where engineers have departed from the cold intellectualism of pure and applied science to give expression to the loftier and nobler ideals of human activity and human sympathy. For of what profit is it to scientific men, physically and mentally, to develop and enrich civilization if they remain passive toward the higher arts and the humanities?

Hence the significance to American engineers of the memorial carillon and the greater circumstance of its placement in that ancient seat of learning at Louvain.

There "in notes by distance made more sweet" songs that nerve a nation's heart vibrate along the arch of heaven and neither men nor angels will let them pass into oblivion. And might I here pause to note, while memory is clear and events are still fresh, that to Edward Dean Adams we are beholden for the concept of the memorial.

THE carillon is "an outward sign of an inward and spiritual grace," and according to L. Van der Essen, secretary of the University, the ringing of the bells has absolutely transformed Louvain. And here note the deep religious sentiment with which the Belgian people view that memorial! "From a city which seemed dead and dull since 1914 when the carillon tumbled down under German fire," Professor Ven der Essen says, "It has now become a town full of memories." * * * "There has been a moment when every man of Louvain has had tears of emotion in his eyes. That was on August 4 last, at 9.30 in the morning, when, as every year since the war, all the bells of Louvain were ringing in memory of the violation of Belgian soil. When suddenly, the 'liberty bell' began to strike. overpowering all the other bells of the city, many persons ran to the Place du Peuple and stood there, looking at the tower, deeply moved as if the voice of the dead American engineers was spreading through the air and saying: 'This is the Liberty Bell now ringing in Free Belgium on this fateful fourth of August. Remember that we died so that you might live and be free.'

"The carillon," says Professor Van der Essen, "has now become in the everyday life of the people of Louvain what I would call a part of their soul. It would be henceforth unthinkable to have Louvain without that carillon, and when one is walking through the fields far out from the city, everywhere he sees that tower and carillon, and the aspect of Louvain with the Engineers' Memorial is now something of a perpetual remembrance of those great things which you intended the memorial should keep alive in our memory."

> O! who shall lightly say that Fame
> Is nothing but an empty name,
> When memory of the mighty dead
> To earthworn pilgrim's wistful eye
> The brightest rays of cheering shed
> That point to immortality?

Tree and vine and flower and shrub now cover the place made desolate by torch and shrapnel and contending armies, and as nature covers the shell-holes and trenches and graves with a verdant green, so time has softened and mellowed the passions and hatreds engendered by that stupendous strife.

On an old stone in an English churchyard will be found this epitaph:

> "He who saves loses; he who spends
> saves, and he who gives away takes
> it with him."

Our engineers gave away their lives and took with them immortal glory and the undying gratitude of millions of people.

But if in the annals of war Belgium has a foremost place, in the annals of peace she deserves recognition out of all proportion to her relative size. In the art of painting she may boast such old Flemish masters as Rubens and VanDyck. A long line of poets and prose-masters has culminated in the twentieth century in men of such world-fame as VanHaeren and Maeterlinck, while in the severer field of political economy the late Emile Laveleye stood in the foremost ranks.

BELGIUM has today four great universities, including the University of Louvain, now a second or adopted Alma Mater, as it were, to every American engineer. She has her Royal Academy of Fine Arts at Antwerp, that great European port where antiquity and industry jostle each other, and her Royal Conservatories of Music in Brussels. that resplendent capital; in Antwerp. in historic Ghent, and in heroic Liege. She has scores of cultural institutions less only than these, and on the other side of life's tapestry she has her mines and her manufactures and her engineering enterprises.

First to suffer in the great war. Belgium was the first of the devastated nations to recover. Most densely populated of European countries, she is among those where prosperity is most general and most evenly distributed. When we hear the "Brabanconne" there comes to our minds the vision of an industrious, pious and naturally peaceful people, united in spite of their racial diversity, and guided by men like Albert, of Flanders and Minnesota, who has proved himself a wise statesman as well as a brave king, and the late Cardinal Mercier, beloved and honored of all mankind.

To have aided in ever so unimportant a degree in insuring for Belgium a future tradition as certain as those of her past, will be worth in satisfaction to America's engineers a hundred times the efforts that they made.

And when we contemplate the memorial at Louvain and listen to its enchanting music may we repeat

> "Their song to us descendeth
> The Spirit who in them did sing
> To us his music lendeth
> His song in them, in us, is one;
> We raise it high, we send it on,
> The song that never endeth."

WILLIS R. WHITNEY—A Moulder of Genius

By MAURICE HOLLAND

A chapter from INDUSTRIAL EXPLORERS, by Maurice Holland, in collaboration with Henry F. Pringle. Published by Harper & Brothers. Reprinted by permission of author and publishers. Copyright by Harper & Brothers, New York

WILLIS R. WHITNEY, of the General Electric laboratories at Schenectady, N. Y., is undoubtedly the best beloved of all the remarkable men who are the crowned heads in the world of research. One says this without hesitation or fear of contradiction, for it seems to be the unanimous opinion of all his fellow monarchs. Many a scientist, scheduled to make the address of the evening on some solemn occasion when a medal is being presented, has intended to hold forth on Whitney's technical achievements, but has dwelt for an hour, instead, on the man's human, lovable qualities. In another decade or so, perhaps, Whitney will close his desk and will retire to his farm on the Troy road, there to continue private explorations into the realms of truth. If he does, and if a farewell dinner is given by his associates, the orator of the evening will have the unenviable task of finding something new to say. Flowers are invariably tossed when Whitney is spoken of.

HE is taller than the average, quick in movement, with dark hair beginning to grow thin and eyes that reveal inner energy, vitality, and joy in life. He seems always to be in an enthusiastic glow about somethiing — science, truth, education, the cosmos, turtle husbandry, some experiment of promise. So marked is the simplicity of his manner, and so hearty and informal his greeting, that it is difficult for the casual visitor to realize that this is a world-renowned scientist, the recipient of many degrees and medals, a man whose words are respected in the gatherings of grave and distinguished men. Not until he has been talking for a moment or two does it become clear that he thinks with the cold, bright logic of those who build dreams only on demonstrable facts.

Mr. Holland is Director of the Division of Engineering and Industrial Research of the National Research Council. He has made studies of the National and Industrial organizations of research in the principal industrial nations of the world and is a contributor to periodicals of both special and general appeal, among the latter being the Atlantic Monthly and Travel

Among all the traits men treasure in their fellows there is none more enduring than generosity. This Whitney has to an almost fanatical degree. He is constantly sought by men from the factory or engineering department for his opinion, advice or other help, and he always give freely, without showing the eagerness he feels to get into the laboratories, to observe and talk over the experiments going on there, where he feels his real work to be. There is not an experimenter on the staff who has not felt the stimulus of his interest, the encouragement of his understanding, the helpfulness of his pointed suggestion. It may be only his suggestion, born of knowledge and broad experience, that has made possible the solution of some knotty problem, but seldom, indeed, is this known except to the man who has received it. But, you say, this urge to help is only part of his job. Then what about the man who writes to say that he has a good opening for a competent chemist and would appreciate Whitney's suggestions? Invariably, if the opening is an attractive one, that man is invited to come to Schenectady to become acquainted with all the men there who might fit the position. "I don't want to lose Smith, Brown, or Jones. They are doing good work here. But if you can persuade one of them to leave he will go with my blessing," is apt to be Whitney's generous response. Rarely, be it said, is a man persuaded, but the desire to help his men to greater opportunities, either within or without the organization, is never lacking. There is here a fundamental generosity of the spirit that makes for better understanding in every contact. It is this quality that prompted Whitney to say, in effect, in initiating the work of the laboratory, here is one industrial research laboratory which will welcome visiting scientists and will publish its experimental results just as rapidly as they can be published without injury to the interests of the company's stockholders.

WHITNEY'S popularity, then, is based partly on his generosity. Obviously he is a busy man, but he always has time to see the most unimportant caller. "Come in, Rain or Shine," is the sign lettered on the door of his private office, an invitation upon which he insisted against the wishes of his secretary and assistants. He sincerely dislikes personal publicity, but the magazine writer or reporter who says that an interview can be sold for a good sum is not likely to be disappointed.

"The chap said he could get $100 for it," remarked Whitney, a little plaintively, after one long session with a rather importunate reporter. "What else could I do?"

Whitney picks good men and loads them up with all the responsibility they will carry. But he himself is the first to enter the laboratory in the morning and the last to leave it at night. A tireless worker, a constant source of inspiration for his associates who work, not for him, but with him.

Whitney's generosity, his quick sense of the ludicrous or absurd, and a certain assumed irresponsibility combine to make him beloved. But the universal respect in which he is held by his fellow scientists in this country and abroad is based on his profound knowledge and of the manner in which he inspires his colleagues to new bursts of endeavor. Restless, active, constantly on the move, Whitney is to be found in all parts of the huge G. E. laboratory. One day he is standing near the lead shield watching Coolidge hurl his cathode rays against a diamond lent by George F. Kunz of Tiffany's. The next he is bending over Langmuir, watching the experiments with gases, optimistic that progress is being made. Whitney is here, there, everywhere, to the distraction of Miss Christie, his secretary. Sometimes he is down in the basement, where, in electric furnaces, tungsten is being drawn into fine wire. Sometimes he is at the shoulder of a junior member of his staff, a young man working with a microscope. And if he is not in a laboratory he is at his desk talking with some one about the work that is going on. Always he is molding men, always creating and maintaining that atmosphere of harmony and cooperation which makes the G. E. laboratory known throughout the world.

As a result of his personality and his passionate devotion to the cause of research, Whitney is called upon to make innumerable speeches before civic associations and at universities and colleges. He hates having to speak and has expressed the wish that an automatic talking machine might be substituted; one which would make appropriate gestures and speak in clear, fluent, even eloquent tones. But, lacking such a machine, he must often yield to the constant pressure, growing stronger every year, despite his protestations that he is a poor speaker. His audiences seem to feel otherwise.

Whitney's addresses reveal many fascinating things concerning his mind. They demonstrate that he is a broadly educated person, that his knowledge is not limited to chemistry and physics. He has pondered the mysteries of anthropology. He finds gratification in the fact that "the arrival of the vertebrates slowly brought forth brains," that "Herodotus, Socrates, Xenophon, Plato, and Aristotle" were "our first and leading phychological engineers" who started the doctrine of "Know then thyself." He realizes that the miracles of science are giving men time to think. When he thinks of "men" he includes women, too.

"Let her experiment," he said in a talk to the girls at Vassar, in touching on the new woman, "and, whether the researches be on dresses or eugenics, in politics or industry, the direction will be right."

It is, he went on, "an interesting young world" we live in, and the miracles of today are the commonplaces of tomorrow. The danger is that "we do not appreciate what we so easily discover." At this moment "a man's voice may penetrate to all parts of the earth, but where is the man to say the things worth every one's hearing?" Whitney is, it appears, no narrow specialist in the fields of physics and chemistry; he is a philosopher in the true sense, a man who loves wisdom for its own sake.

It is almost superfluous to point out that the traits and characteristics found in the Whitney of today had their beginning in his youth. He has remarked that he is "at a loss to know why so many men go through college keeping their eyes mainly on a ball of some kind when the world is so full of greater interest." From this, one concludes, and correctly, that the youthful Whitney was rated as a serious lad by his companions. He was born in 1868, at Jamestown, N. Y., that city not far from the blue waters of Chautauqua Lake, not far from the fields where sprang up discussion groups at which men talked of religion, morals, and other mysteries and where the Chautauqua Idea had its birth. More than half a century later, ill at ease because he had to make a speech, Whitney stood up to receive the Perkin Medal, a badge of knighthood in American industry, for his work in stimulating research. Sir William Perkin, he said, had become a chemist "through the influence of an Englishman named Hall, with whom he came into contact when under fifteen years of age."

"I have the honor," Whitney continued, "to have started as a chemist in this identical manner, and I will tell a little more about it, because I have always wished I had some way of expressing my gratitude to my particular Mr. Hall.

"When I was about fifteen years old a mill owner and one of the leading citizens of my home town, William C. J. Hall, assisted in establishing a Young Men's Christian Association. He had also long been interested in the microscope and was a scientist such as we seldom find among business men today. He formed a free evening class for about half a dozen boys—all that could work together around the rotating table on which he placed his immense microscope. This was so arranged that specimen, instrument, and illuminating system did not have to be disturbed as they passed from one boy to another for observation. He did not merely show his specimens, of which he had thousands, but he taught us how to prepare them in all the various ways, now more or less common. They were wonderful to me, and still are.

"My mother gave me some money which, combined with that of one of the other boys, purchased a small microtome, and my father gave me $75 for a microscope. Under Mr. Hall's guidance I bought the instrument, with the understanding that whenever I wanted a better one the old one would be taken back at the original price. I later procured one for $250 which, throughout thirty-five years, I have used almost daily. One of the first experiments I tried with the microscope was to precipitate metallic silver from silver nitrate solution onto a speck of copper filings. Any one who has watched these beautiful crystals grow knows that they are surpassingly wonderful. They constituted my first chemistry. It was those little bottles of salts and bugs in alcohol that led some one to call me a chemist, and it apparently determined my future work.

"It does not seem now as though any one else ever enjoyed a tenth of the pleasures my old microscope introduced to me. I find them inseparably interwoven with about everything I know. Even the barren North Pole reminds me of Andrée and Amundsen and microscopic algæ which drifted across the polar circle from the Lena delta. The equally barren Sahara reminds me of Darwin and De Vries and the diatoms which were carried by the wind from central Africa and fell on the deck of the Beagle, hundreds of miles away."

Whitney began to ride a hobby, evidently, at the age of fifteen. He has been riding one ever since. The nature of the hobby is less important. Whitney is not particular so long as it offers another outlet for his inquiring mind. Once he devoted all of his spare time to looking for Indian arrowheads. He would spend entire days tramping through field and meadow, and when he had found one he would examine it, classify it, learn everything there was to know about it. Then he would compare it with crude tools used by prehistoric men, would dig through musty volumes dealing with anthropology. Another time he became fascinated by turtles and raised quantities of them on his farm. He learned of their private habits, their life-span, their characteristics. Some years ago he was forced to make a trip to the West in connection with the work of his laboratory. On the way out he made several speeches, and on the return trip stopped off to attend scientific meetings. His chief anxiety, however, was to get back home before the turtles came from their places of hibernation, and he was delighted when this turned out to be possible. He has experimented with numerous agricultural problems, and is actively interested in the application of various physical agencies to the treatment of human ills. He is a student of heredity. And he does all these things, not as a faddist who takes up one subject to drop it for another, but as a serious student. Nothing in nature is alien to him; everything is filled with possibilities that are startling and beautiful. Withal, as we have seen, he is a jovial soul. He has complained, in at least one solemn address, that it is difficult for him to keep from "being facetious." He is said to have dodged several technical powwows to attend a musical show.

SOME day a book will have to be written about Whitney, for the many sides of his character cannot adequately be told in a few thousand words. No doubt, the most accurate summation of him would be to say that he feels deeply on all things. No one who did not could say, as Whitney has, that "the only perpetual motion is the growth of truth." Another way to offer a portrait of Whitney's nature is to say arduous if through it young men can be taught. He is a member of the board of governors of Union University, a trustee of Union College and of the Albany Medical College, and was, for ten years, a member of the Corporation of the Massachusetts Institute of Technology. There is slight doubt that he would withdraw, without hesitation, from the General Electric Company and again go to teaching were he to decide that in such a way the education of young men could better be advanced.

He began as a teacher, in the days before industrial research, as it is known today, had been thought of. He had been graduated from M. I. T. in 1890, with the degree of S.B., and was immediately appointed assistant instructor in chemistry. His formal education was, however, far from complete and he spent two years at Leipzig and received the degree of Ph.D. in 1894. He also studied in Paris. It does not seem to have bothered him that progress in an educational institution is slow. He was content to accept, in 1895, the job of instructor at M. I. T., and that of professor in 1901. He has recalled that he once asked for a salary increase of $75 a year and did not receive it, and he thinks that he learned thereby that "financial rewards are not the main thing." His chief recollection of his early days is one of gratitude for the inspiration he received from his teachers. Professor A. A. Noyes, of Tech, he has said, liberated him "forever from the wiles of college football." He had been experimenting with Noyes and had planned to attend a Harvard-Princeton game. The experiment proved so fascinating that he forgot all about the game.

WILLIS R. WHITNEY

It is incredible, in the light of the position held by scientific research in industry today, that it was almost an unknown thing in 1900. Of course, there were experimental laboratories in some of the larger plants, but these existed chiefly for the purpose of assisting in manufacturing processes. They were "trouble stations," called when something went wrong. What is now known as research was then the unchallenged province of the inventor. It was not until 1904 that Frank B. Jewett, another M. I. T. man, was called to take charge of the research work of the American Telephone and Telegraph Company. Whitney, asked to organize the General Electric laboratories in 1900, has seen research in industry develop before his eyes. And the research laboratory at Schenectady will be, despite his varied work in many fields, his most enduring monument.

WHITNEY must have known what this laboratory was going to mean. Even in 1900, he looked into the future and saw an industrial laboratory in which pure science would be encouraged. Nothing else would have called him from teaching, a field where young men could be inspired and where, at the same time, truth could be sought for its own sake. Several years before that he had been offered a position by Arthur D. Little, of Cambridge, and had declined, saying he would "rather teach than be President." On another occasion he had remarked that unless there were "problems to be solved in Heaven," he did not desire to go there when he died.

Whitney is able always to be attacking problems, many of them in the field of abstract science, because so many of the everyday details of laboratory operation are handled with efficiency and dispatch by Hawkins, his research engineer. Hawkins is, in many ways, as busy a man as Whitney himself. He must attend to a thousand details, obtain the needful appropriations, adjust complaints, supervise the purchase of equipment and other expenditures, keep things running. He commands the Service of Supply. And yet he has, no less than the director of the laboratory, a clear vision of the true significance of research. Hawkins has said that research is "simply an exploration, a systematized search." It goes on "whether or not what is found is eventually applied." Research is "not the obtaining of additional data regarding what is already known; it is the exploring the unknown for generic facts or principles." It "seeks the new knowledge which makes new things possible."

Such, with a personal leaning toward the acquisition of knowledge for its own sake, was the vision of Whitney when he assumed charge of the new laboratory in 1900. In his direction of the laboratory activities, he is not commercially minded in the sense that he must see an immediate profit from each undertaking. He has the broader vision that sees that the greatest ultimate results come from the scientific pioneering which opens broad new fields of knowledge, but which cannot be expected to yield immediate financial returns. His point of view was clearly demonstrated when, in the summer of 1909, Dr. Irving Langmuir came to the laboratory.

LANGMUIR had been teaching chemistry at Stevens Institute and expected to return to his post in the fall. Arriving at Schenectady, he was told by Whitney to look around and determine what interested him most. He noticed that many of the men on the staff were working on the development of drawn tungsten wire under a process devised by Coolidge, and Langmuir suggested that some of the difficulties being experienced might be due to impurities in the wire. There might be, he thought, certain gases present. His work proved so interesting that Langmuir was glad to resign from the Stevens faculty to continue his purely theoretical researches. No definite program was assigned. He was even given assistants to aid in the study of gases, merely to see what would happen when he introduced them into the lamps.

"During these first few years," he has recalled, "while I was thus having such a good time satisfying my curiosity and publishing scientific papers on chemical reactions at low pressures, I frequently wondered whether it was fair that I should spend my whole time in an industrial organization on such purely scientific work, for I confess I didn't see what applications could be made of it, nor did I even have any applications in mind. Several times I talked the matter over with Dr. Whitney, saying I could not tell where this work was going to lead us. He replied that it should lead anywhere. He would like to see me continue working along any fundamental lines that would give us more information in regard to the phenomena taking place in incandescent lamps, and that I should feel myself perfectly free to go ahead on any such lines that seemed of interest to me. For nearly three years I worked in this way with several assistants before any real application was made of my work. In adopting this attitude Dr. Whitney showed himself to be a real pioneer in the new type of modern industrial research."

In the end, of course, this virtue brought its reward in millions. Langmuir was the first to apply argon and nitrogen to tungsten lamps, and nearly 1,000 million of the new lamps have been made in the United States. The American public has been saved $1,000,000 a night on its lighting bill.

Similarly, in the case of the Langmuir radio power tubes, the General Electric laboratory demonstrated that apparently unrelated research may well lead to a device of outstanding industrial importance. Langmuir, scholar and explorer, studied electron emissions and perfected a power tube capable of amplifying high-frequency current in amounts requisite for radio transmission. If research yields new knowledge in fundamentals, there is no need to worry about its application.

THE genius of the gentle and amiable Coolidge is just another example of this. He was studying the phenomena of electron discharges in high vacuum, and his new X-ray tube has virtually displaced all other types. It has been developed in sizes up to 250,000 volts and down to a dental tube so small that both it and its transformer can be inclosed in an oilfilled metal casing and swung on a wall-bracket or carried like a hand bag. Now Coolidge is playing with cathode rays developed by giant tubes. No one knows quite where this cathode ray work is leading. No one, if the enthusiastic interest at Schenectady is any indication, worries greatly. The effect of these cathode rays is equal to that of a ton of radium. Its significance is still clouded with doubt, but untold possibilities lie in the new lands which this explorer is beginning to enter. Germs and spores have been killed by an exposure of less than a second. It has been possible to produce the vitamin which cures rickets. The rays have been found to be powerful catalytic agents. It is not impossible that new forms of energy will be discovered and a new world created. Meanwhile Coolidge is stepping up his voltages, building larger tubes, wondering what will happen when he has reached 7,000,000 volts!

But the story of the General Electric laboratory, like that of Whitney himself, needs a volume for its telling. Of all of this work Whitney is the inspiration. He writes papers and makes speeches, sometimes with amazingly revealing titles like "Vacuum, There's Something In It," and "Aristotle was

Electricana

"A professor of Harvard University has sent Mr. Edison 50 specimens of fibres to test for the carbon horseshoe instead of the paper formerly used. Amongst those who have the best opportunity of judging what he has done, or is likely to do, little hope seems to remain of his ultimately attaining success with his incandescent lamps."—*The London Standard,* 1879.

Heh, Heh, Heh!

IN DARKEST AFRICA

"Dr. Harold Gifford of Omaha, Neb., one of the League's most faithful supporters and president of the Nebraska Public Ownership League, recently returned from a trip through South Africa. Upon his return he wrote us as follows:

"'I am more than ever impressed with the importance of public ownership, and was surprised and pleased to find that in South Africa they are far ahead of us in this respect. All the railroads, telegraphs, etc., are government owned and run.

"'In Durban, and I think in the other large cities, all public utilities are publicly owned. Durban has its own street cars, water works, light and power, public abattoir and fertilizing works. The latter two are conducted without any bad smells, just as our packing houses could be made to do if we made them as clean.

"'In Durban, they also run a brewery for the natives, who had formerly been getting their beer (pombe) at private joints where they were constantly getting into trouble. Now they get it at the public breweries or not at all. They are not given more than so much a day, and can get with the beer a very hearty meal for about seven cents.' "—From *Public Ownership,* official organ of the Public Ownership League of America.

* * * *

Is this an argument for public ownership?

A MODERN MILKMAID

Modern version of an old rhyme:
"Where are you going, my pretty maid?"
"I am going to oil the bearings on the electric milking machine, sir," she said.

Recent drolleries attributed to Mazda Lane. Compiled by S. E. D.:

Don't be a dim bulb all your life, dearie.

We call him Bulb, because he goes out so often.

His eyes look like a couple of empty light sockets.

I hope to broadcast myself hoarse, it is!

It may be the greatest circuit in the country for some, but it's going to be a short circuit for me.

Own your own Ohm.

What's the voltage of this liquor, anyway?

He was so dumb he thought that "A. C." meant Athletic Club, and that "D. C." stood for District of Columbia.

WHERE MEN ARE MEN!

"Hello, old man, where have you been?"

"Just got back from a camping trip."

"Roughing it, eh?"

"You bet! Why, one day our portable dynamo went on the bum and we had no hot water, heat, electric lights, ice or radio for almost two hours."

There is a striking decrease in the number of municipal plants in many states, according to *Electrical News Items* which quotes the U. S. Bureau of the Census as saying that this is "due to the abandonment of municipal generating stations and the acquisition of municipal distributing lines by commercial systems."

* * * *

To a regular reader of the published reports of the Public Ownership League of America it seems that there just must be something wrong with ELECTRICAL NEWS ITEMS, or the U. S. Bureau of the Census, or both.

GOVERNMENT (POLITICAL) OWNERSHIP AND OPERATION AND THE ELECTRIC LIGHT AND POWER INDUSTRY

Published the first of the year and now available at the headquarters of the National Electric Light Association.

Contains 530 pages devoted to the intrusion of government into business and the municipal operation of electric light and power plants. Chapters on:

1. History of Political Ownership and Operation.
2. Questions Usually Asked About Political Ownership and Operation.
3. Authoritative Opinions on Political Operation and the Relation of Government to Business.
4. Municipalities which have abandoned, sold or leased their electric plants to private companies. Municipal distributing systems (where municipalities had no generating plants) sold or leased to private companies.
5. Municipalities which have abandoned, sold or leased their generating plants and are now purchasing power wholesale from private companies, but which still own and operate the distribution systems.
6. Bibliography.
7. Index.

Bound in maroon board covers, lettering in gold. Prices, plus transportation:

1 to 10 — $1.50 per copy
11 to 25 — $1.40 per copy
26 to 100 — $1.30 per copy
101 or more — $1.25 per copy

NATIONAL ELECTRIC LIGHT ASSOCIATION **420 Lexington Ave., New York**

Right." There are at the present time about 400 men and women employed in the laboratory, about half of them scientists. Whitney knows all of them personally, however. When some new man is taken on it is not long before the director has dropped into his laboratory to see how his work is coming on. He is cheerful, encouraging, optimistic. He seems to spread hope and faith wherever he goes. And he knows, in some uncanny fashion, everything that goes on. Whitney is, perhaps, more like Coolidge than Langmuir in temperament. The latter is rather too systematic for Whitney's volatile nature. Langmuir sometimes insists that some particular path is not worth following. Whitney, without thinking about it, sees red when he is told that something cannot be done, and occasionally the laboratory is vastly entertained by a brisk row between the two men. They are, it is needless to say, devoted friends.

Coolidge says, "It's because Dr. Whitney is there that Langmuir and I can play around. He stands between us and the demands that we do something practical."

IT is hard to believe, looking at Whitney, that he is sixty years old. His vigor is that of a man of forty; his curiosity that of a child asking questions about the winds, the rains, and the beams of light that slant down across a room from a window. Of course, he takes pride in the laboratories he has built and the organization he has developed. Naturally, he rejoices that it was possible to leave the realm of teaching and find that a great industrial corporation would encourage the search of truth. From time to time another medal is presented to him and the orator of the evening again tells of Whitney's profound knowledge, his lovable traits, his generosity. But Whitney best described himself, unconscious as he may have been of that fact, when Langmuir was the guest of honor and received a medal on a night in March of 1928. On that occasion he said, in part:

"THERE is something in Langmuir's work that suggests, by sharp contrast, an Oriental crystal gazer seated idly before a transparent globe and trying to read the future without doing anything about it—a hopeless philosophy. In my picture an equally transparent and more vacuous globe takes the place of the conventional crystal sphere. It is a lamp bulb, a real light source. Langmuir boldly takes it in his hand, not as some apathetic or ascetic yogi, but more like a healthy boy analyzing a new toy, even as Langmuir himself studied and fixed the complex watch of his boyhood days, but seeing visions, too, of many new things. There might have been nothing in that vacuum, but he was driven by insatiable curiosity to investigate and learn for himself.

"Thus he peopled that empty space with new and strange little beings or personalities which he had first dreamed of, then devised, and finally endowed with real character—and all this solely to make his various dreams come true. He first dreamed that tungsten atoms were being carried by foreign atoms (of oxygen) from the filament to the glass to obstruct the light. He dreamed of banishing or imprisoning these, and when he made this dream come true we got good, clear, long-lived tungsten lamps.

"Still Langmuir dreamed, with both eyes on the ball, of a greater light. Therefore he populated the lamp bulb with new beings, rare gases of dependable character, like nitrogen or argon. By this method the light he foresaw in the bulb became just twice as great as it was before, and all of us now easily see it, and the world is glad to pay for it.

"Gazing into the same sphere again, he dreamed about disembodied electricity, and soon the reliable little electrons were tamely obeying special laws —laws that had never been known before and that most men do not yet understand. He gazed again and saw atoms cooperating with his electrons, so that he was able to add to the thermionic servants of the radio sphere accurately controlled groups of electrical helpers in the shape of gas ions, and thus he continually improved radio tubes.

"Here lies the difference between the ancient and the modern seers or prophets. The modern prophet is a doer. No one can fix the best ratio between thinking and doing. The pure thinker is apt to think too much, and the active man to be too active. Evidently that Mendelian law which determines mutations and produces increased strength by cross-breeding explains why a certain mixture of thinking and acting yields the greatest product. I know of no one who seems to combine these two characteristics in better balanced ratio than Langmuir."

On the Occasion of a Ground Breaking

Truths of more than local application uttered by A. W. ROBERTSON, President of the Philadelphia Company at ground breaking ceremony of the proposed power station of the Duquesne Light Company at Brunot Island, near Pittsburgh, Pennsylvania. Since this occasion, Mr. Robertson has become Chairman of the Board of the Westinghouse Electric and Manufacturing Company

ON this spot will be built a giant power station. Its foundation will rest far below on the granite rocks. It will tower above us, beautiful and massive in its outline. The immense brick building will house great boilers and mysterious machines. From this point electric current will flow out to Pittsburgh's mills, factories, offices and homes. Here will be the center of 400,000 hp. of energy tamed, ready to serve the community.

Some will see only money, money, money, in the project, and it is true that money can be found at every stage. The investors who will furnish the money to build the plant will be looking for a profit on their investment. The company expects to use the plant to make a profit to pay the investors who have furnished the money for the plant; and that who buy the electric current expect to use it to make money or save money. As a business proposition this must necessarily be so, for if the plant is not a financial success, there would be no known way of keeping it in operation.

BUT there will be many unseen things here also. Within the plant we will find the inventive genius of the Edisons and Westinghouses of the electric world embodied in many wonderful devices. The results of many master minds will be here. The hopes and aspirations of Mr. Callery, former president of the Duquesne Light Company, are blossoming here. Here will be found the latest and noblest conquest of man over the laws of nature. In this plant will be found the hopes and aspirations of thousands of men who have spent their days in laboratories and in research to the end that the giant electricity, which has slumbered in the bosom of the universe for so many ages, be tamed and harnessed to serve mankind.

One often hears fathers say to sons, "Things come easy now," and I am reminded of this thought by the confidence with which we plan this power station. We haven't the money to build it this minute, but we have surveyed the development and growth of the Pittsburgh district and are certain that it will need additional electrical capacity in 1930 and we are going ahead with perfect confidence that we will be able to get the money to build the plant and earn a return on the cost of the plant after it is completed.

The money to build the plant must come from many different people. The investments in public utilities are so huge that they never can be financed out of earnings; and the company must sell bonds and stocks to get extra money to make additions and betterments. We will get the money from big and little investors the country over. If we get it, and we will, it will be for one reason; and that reason is that those men and women who have saved money and want to invest it, think it will be safe with the Duquesne Light Company in Pittsburgh. That is, safe with the Duquesne Light Company and safe with Pittsburgh. If the company were some other company we might not be able to get the money. If the company were in some other place, we might not be able to get the money. Both the company and the place where it is located are of vital importance. If these potential investors did not think it would be safe with us, and by us, I mean Pittsburgh and the Duquesne Light Company, we could not get one penny and you would never see here what we have said you will see.

This power plant, in a sense, is possible only because of the mutual confidence which pervades the whole situation including investors, community and company. It is a magic circle in which Pittsburgh looks to the Duquesne Light Company for power for every purpose and is not disappointed. The mills, factories, offices, and homes depend upon it almost as much as we depend upon the air we breathe. And, in turn, the Duquesne Light Company depends upon Pittsburgh to help it protect and guard the great investment of others' money it has made here. The investor trusts both the company and community with what may be the savings of a life time. And, knowing this, we plan with confidence this new power plant, costing many millions of dollars, to serve Pittsburgh in 1930. It will take the place of hundreds of power plants scattered throughout the territory.

IT will be seen that the management of the Duquesne Light Company occupies a position of trusteeship in which it must be faithful and look after the interests of the consumers who depend upon it. Millions upon millions of investments of consumers would be lost if the Duquesne Light Company service failed. The management must be faithful also and look after the interests of the investors who furnish the money for the plants such as this. Millions upon millions of money of investors would be lost if the Duquesne Light service failed. And the management must be faithful and look after the interests of thousands of its own employees who devote their lives to maintaining the service of the company; and it is significant that these three groups are made up of many individuals and small groups. In other words, the company is owned by many investors and employs many persons to serve many consumers.

These three duties of management must be harmonized and serve impartially, and all successful managements realize this triple trusteeship and measure up to the requirements as best they can, reconciling conflicting interests wherever necessary.

This thought of trusteeship in public service management brings us naturally to the great name which this station will bear. It will be known as the JAMES H. REED POWER STATION of the Duquesne Light Company. It is named after our dear friend and associate familiarly known as "Judge Reed," who, for a quarter of a century, was either president or senior

(*Continued on page* 113)

Central Stations Think *They Are Interested in*

ELECTRICAL ADVERTISING

But They Don't Realize What the Possibilities Are

By JOHN F. GILCHRIST

THE handwriting on the wall at Belshazzar's feast some three thousand years ago is the first record we have of an illuminated sky sign. From that early example there has been a great development, bringing the art up to its present standard as viewed in the theater district of Broadway and other similar centers in the great communities of today. Practically all of this development has been in the last forty years. The first outdoor electric signs in Chicago which I can remember were two placed on the Jackson Boulevard canopy of the old Grand Pacific Hotel in the summer of 1888 by supporters of Senator Allison of Iowa in his race for the Republican presidential nomination. They were crude receptacle sockets fastened to the face of a broad pine board and equipped with lamps of that period, the point of the lamp being probably ten inches in front of the face of the board.

Electricity is one of the greatest mediums for advertising. Perhaps it is the greatest of all. But it has not been developed as it should be. We people in this business control it; the fault is all ours.

From One Development to Another

There are so many developments for the use of electricity for the benefit of mankind (and they have come so rapidly and each is so interesting, even fascinating) that we have jumped from one development to another, and all but the latest have been neglected.

It is time that we organized departments of high-grade men to specialize each in its branch of exploitation work. Then we will get the real development which each of these wonderful human helpmates is entitled to.

We are told the advertising bill of the United States reaches the stupendous sum of $1,300,000,000 per annum. I myself think it is more than that, perhaps as much as $2,000,000,000, more anyway than all the money paid to the utilities for electricity in the nation.

A past president of the National Electric Light Association, Mr. Gilchrist has taken part in many association activities. He has been with the Commonwealth Edison Company and its predecessor, the Chicago Edison Company, during his entire business career. Beginning as an office boy in 1887 he has had in his climb to a vice-presidency of the company, intimate contact with many phases of the utility industry

Electrical advertising is perhaps 5 per cent of the first figure named, or $65,000,000 a year. At the very least consideration it should be $300,000,000 a year, of which $200,000,000 would be for electricity. The increase over the present income from this source would amount to over 10 per cent of the electric utilities' entire income at the present time.

A careful estimate of the possibilities in the immediate sale of signs and the material which goes into signs is $250,000,000 to provide electrical displays for all commercial institutions which are lacking them at the present time. This is certainly a conservative figure. I estimate that it would be at least $500,000,000, as there would be a great deal of business in replacing the inadequate displays on the premises that now have some display.

Convince the Architect

We in the electrical industry have not paid enough attention to convincing the architect of the values of electrical decoration and the possibilities. Electricity is here to say. It is already the greatest factor in human life. The proper blending of electric illumination with architecture is inevitable, and the architect who first realizes the possibilities and starts to utilize them in a large way will establish for himself a great eminence. The present-day life of the people results in great appreciative audiences for all kinds of outdoor night displays. The automobile and the amusements of the period result in a large percentage of the people being in the outdoor every evening to midnight or later, so that electrical displays and advertising will never go unadmired; but we should pay more attention to the artistic development of our equipment, so that they will make fine attractive day signs as well as night signs—not, as is too often the case now, merely unsightly structures.

Let me discuss the subject a little from the viewpoints, each, in turn, of those most interested in electrical advertising. First, let us consider the advertiser. He wants good circulation, as great as can be obtained through other mediums. He wants high, artistic merit, and I think we feel that we are lacking in this respect when we compare the appearance of what we have to offer with the beautiful things which are offered today by the printers' art, and even that of the billboard. He wants good service. It is one thing to see a great new display in its pristine beauty and quite another thing to care for it day in and day out so it will always operate regularly and look as well as when new. Many an advertiser has been driven to other mediums because of the unkempt appearance of unserviced signs.

The Advertising Agency

Consider next the advertising agency. We have not yet influenced it sufficiently so that it regularly includes a proportion of the advertising budgets of its clients for electrical advertising. The greatest pains should be taken to "sell" the agencies on the value and efficiency of our medium. They are entitled to their full, fair commissions, the same as they make when recommending other mediums, perhaps more at first, and we certainly cannot expect them to get very enthusiastic over our medium unless it pays them to do so. We know our medium is of sufficient value so that if properly developed and presented it will justify a price which will give us a good profit and give the agency a good commission.

From the point of view of the public: Perhaps the matter of first importance to them is the question of artistic effect—something which will enhance the appearance and attractiveness of its communities and not detract from it; and this must be a twenty-four hour matter. The public will become impressed with the value of this great service in considering the best interests of its communities, and particularly the best interests of their commercial institutions.

They Think They Are Interested

Let us turn now to the viewpoint of the central stations. They think they are interested, but unfortunately they do no realize what the possibilities are, as I have heretofore pointed out. The ordinary central station expends less than one per cent of its gross for advertising. The railroads spend 4 per cent of their passenger earnings, and various industries spend all the way up to 30 per cent of the chewing gum and patent medicine businesses. Five per cent is perhaps an average figure and would be quite justified for the electric utility, but supposing we fix it at 3 per cent. If so, at least one-half of this, or 1.5 per cent should be spent for electrical advertising. The utilities do not do enough of this, and I think they all realize it. But the great difficulty is in the present development of the art to know just what they want and convince themselves of what is available, and suitable and dignified.

As a personal illustration: I am perhaps more responsible than any other man because the company I represent does not do enough electrical advertising. But here is how these things work. We have had a committee working for six or eight months on designs for signs for our substations. After much discussion and the gradual reconciling of diverse views in the committee, the gentlemen agreed on a recommendation. I presume this means principally that they tired one another out. These sketches showing how the signs would look on the buildings were enlarged, and I have a pile, perhaps twenty of the, on my table. They have been there for two months.

A Matter Not Forced Is Put Aside

The real reason for the delay has been that when I looked them over they were not what I expected or would like to see. In fact, I was disappointed in them, and I hesitate to go ahead on these plans. The suggestions may be good—probably are—but before I am convinced of it, it will be necessary to arrange a meeting, probably a series of meetings, involving a good deal of time, to thoroughly get the minds of the group down to the proposition to give thoughtful consideration to it. This, as I say, takes a great deal of time, and in the busy days of a great business a matter which is not forcing itself upon you is put aside for other matters. I think this is what is happening all over this country, and it is one of the things which you gentlemen have to contend with in getting your companies to use more electrical advertising.

When we consider the viewpoint of the sign manufacturer, we see that he has serious problems. Because of some of the things we have been discussing, the cost of selling electric signs is extremely high—so high that practically no sign builders in the country have ever made any money. I will not go into the details of the tribulations in the matter of furnishing expensive sketches without end. Then, after the designer has gone to great expense, he may secure only a trifling percentage of the business solicited. It is a fact that a great high load factor revenue to the central stations is being impeded in its development because of the indifference of the public utilities in not being willing to stand part of the pioneering expense, and furthermore because of their not seeing the serious loss which they are sustaining by encouraging small competition.

Support the Manufacturers

It is a fine thing to patronize the small local sign builder. In many cases he is responsible for the interest in electric signs and he should have certain support and consideration, but if the central stations do not unite in supporting and building up three or four big national sign manufacturers, with resources sufficient for development, the sign business will languish.

Perhaps the greatest factor in the development of the electric utility business is the fact that great resourceful, centralized manufacturing companies have provided them with advanced apparatus and appliances. One reason why the gas companies of the country have not succeeded as the electric utilities have is because they have in that field no General Electric Company, no Westinghouse Company.

You would not go to the local blacksmith to have him make a turbine for you out of patriotism. You would not go to the local watchmaker to have him make a meter for you. That idea is preposterous; and yet in this field a large number of people are most concerned about the local man, and by supporting him they are retarding the development of the industry and interfering with developing a resourceful group of large manufacturers, who, to the extent that they have resources, will create a great development which will mean millions to the utilities.

I mentioned the architect a few minutes ago. He, too, must be educated until he fully appreciates what this great industry can do for him.

These are the principal thoughts I have in connection with the branch of the industry in which you are so much interested. Its possibilities are great. I think we have entered a new era and that we will see in the near future a very wonderful development which will be very satisfactory and profitable to all of us.

Progress of Development and Research

Relating to INDUCTIVE COORDINATION

By H. L. WILLS

MAN has always taken freely of everything that nature's vast storehouse contains just as soon as he has learned how to take and how to control those things or those forces; and, by application, reap the reward of a more secure, less laborious and a more pleasant life.

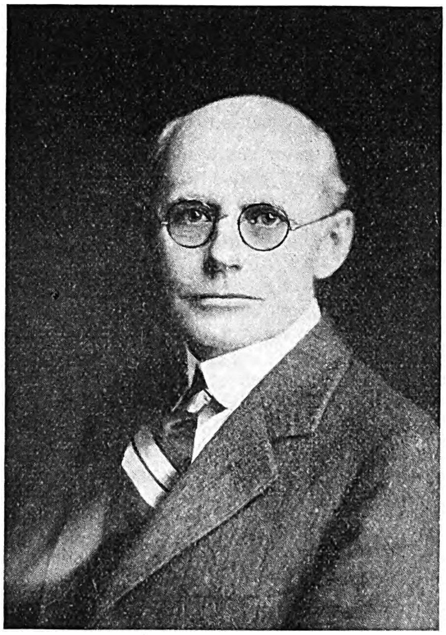
That one of nature's forces which we call electricity makes it possible for man to conserve his strength of body, secure greater peace of mind and more bodily comforts than was possible before this phenomenon was brought into effective activity, and in some degree controlled.

Today there is widespread knowledge of some of the most apparent of the laws of this phenomenon, and as a result of this knowledge we have put this force to work to lighten the labor of the human family and bring into neighborly touch its members, even those at the far ends of the earth.

Almost as a matter of course the first and most obvious use of electricity was one that required that small amount of power that was well within our ability to provide and at costs that were not excessive. Its application as used in telegraphy provided a facility that was wonderfully useful; its use spread rapidly, and as transmission distances increased, inventive genius found ways and means to carry on this work without having to go to materially higher power levels, raised greatly the speed of operation and multiplied the concurrent use of each transmission conductor many times; all of which, directly and indirectly, was of very material benefit to the business world and to society in general.

Free Development in Early Stages

During the formative stages of this industry, no other uses of electricity made it necessary to consider anything but the problem at hand—in other words, the development was carried forward with the utmost freedom, circuits were the most simple and the design of instruments was almost casual. The growth of the industry brought consolidations of the separate enterprises and consolidations brought standardization for both transmission line construction and instrument design and characteristics; thus, the early practices in the art formed the background which has affected the advances of later years.



Mr. Wills is Chairman of the Inductive Coordination Committee, N. E. L. A., and an authority on problems of inductive interference and coordination, but even more important is the fact that his friends always call him "Dad." He is one of the industry's old-timers, and is now Assistant to the Vice-President and General Manager of the Georgia Power Company.

The telephone started on the same primitive basis and was practically unhampered, but it was soon discovered that for successful transmission of voice currents a fundamentally different treatment of the transmission line question than that established for the telegraph was required, and meeting this requirement increased the costs of the transmission circuit. Here again inventive genius expanded the burden imposed on each transmission circuit without having to go to materially higher power levels.

When electric lighting and power systems began operation in the cities or towns, the amount of power and the voltage that was required was relatively small, the circuits were the most primitive, and the appartus was more or less crude, but as demand for this service grew, changes in generating apparatus and circuit design were necessary to provide the power required to fill the demand. Voltages of transmission and distribution systems have increased steadily.

Each of these systems developed in its own peculiar way, largely independent of any restriction that one use of electricity might impose on any other use.

Each developed in a perfectly logical direction.

Each has contributed in very large measure to the material and physical welfare of a great body of people.

Each Type of Service Indispensable

Each has become so interwoven in our social, business and industrial life that they are indispensable.

Considering what has been said of the development of the telegraph, telephone, and electric power systems as a background for our picture of the present-day situation, and considering further the fact that telegraph and telephone systems as a class have been developed along lines of greater circuit utilization without having to go to materially higher power levels, that the electric power systems have been called upon to deliver larger and larger amounts of power, that the transmission and distribution lines of all these systems occupy the same streets, highways, and in other situations where these lines are placed in relatively close proximity, it is only a natural consequence that those lines transmitting the larger amounts of power would have a decided influence on those lines which function with an exceedingly small amount of power.

Only the fact that the necessity for coordination was realized and preventive and mitigative measures applied to all of these systems, has made it possible for the systems concerned to meet the needs of their patrons.

In the ordinary walks of life, if one person interferes with another in the conduct of his business or his social life, there have been established certain codes which are interpreted under the rules of law by the courts, and thus are determined the duties of each party; whereas, when the operation of one electrical circuit interferes with the operation of another electrical circuit. commonly accepted codes are lacking which clearly define an equitable assignment of duty to each party operating these circuits.

Cooperation between the National Electric Light Association and the Bell Telephone System has brought about a mutually acceptable code of principles that stands as a basis upon which adjustments of problems arising through inductive interference can be effected. A few practices have already been agreed upon. These practices, however, do not contain quantitative values which are important to their direct application in the field.

The Immediate Problem

Our problem now is to expand these practices to cover all our needs, and to do this we must know the extreme limits to which coordination measures can be carried out in both systems. Then we must determine how far these measures may be carried in either or both systems, and not unnecessarily restrain advancement in the arts, or bar the further expansion of the services by reason of prohibitive costs.

We have organized a Joint Development and Research Subcommittee, and to this Committee is assigned the task of securing the necessary data which will make it possible to complete the code of practices so that they may be applied more directly as working tools to the everyday field problems of inductive coordination.

This Joint Development and Research Subcommittee has undertaken to collect the necessary data to answer the questions involved, through the establishment of eleven so-called Project Subcommittees. For convenience of reference these Subcommittees have been arbitrarily numbered from one to eleven inclusive.

Specialized Investigations

To Project Subcommittee Number One has been assigned the task of securing data on the following subjects:

1. Unbalance of telephone circuits—line and apparatus—magnitudes and relative importance of different types—methods of location and measurement.
2. Longitudinal propagation of induced voltages and currents.—This refers to the propagation along circuits composed of the wires of a line as one side and ground as the other, and is of importance in determining the effect of unbalance and the relation of effects at exposure and at circuit terminals.
3. Shielding—mutual reactions of a plurality of telephone circuits—relation between effects on a single circuit and effects on the same circuit among a group of other circuits on the same line—relation of induced voltages and voltages or currents produced under operating conditions.
4. Relation of effects measured at ends of isolated exposures and at circuit terminals.
5. Cumulative effect of successive exposures. Law of combination.
6. Efficacy of coordinated transpositions—calculation and measurement of coefficients of induction—design and installation of coordinated transpositions in power and telephone circuits—calculation and measurement of coefficients of induction after transposing.

Some data has been secured on this project through a series of tests made on a group of circuits located near Cincinnati, Ohio.

At a location near Terre Haute, Ind., was found another situation where a large amount of data on these subjects could be secured, and the last two years have been devoted to intensive work at this point.

Other situations must be secured that will provide an opportunity to check all of this data under conditions that are so decidedly different from the original situations that we can be sure that the whole field is properly reviewed.

Project Subcommittee Number Two has for its assignment the following:

An investigation of telephone protective methods and apparatus to determine the practicability of their improvement from the standpoint of inductive interference and physical hazard.

What may be expected from this study should be about as follows:

1. Clear understanding of the features of the telephone and power systems which effect the protection of the telephone system.
2. Data on the operation and performance of present protective devices.
3. Information as to the importance of telephone protection in respect to inductive and safety coordination.
4. Conclusion as to the possibilities of developing improved methods and devices from the standpoint of inductive coordination.
5. Conclusion as to the possibilities of developing improved methods and equipment from the standpoint of safety coordination.

A large amount of data has been secured by the Project Subcommittee from tests carried on in the Bell Telephone Laboratories, the Schenectady or Lynn works of the General Electric Company, the Westinghouse Electric and Manufacturing Company's works, and from many other situations where opportunity favored. However, there is still more to be accomplished before worth while conclusions may be drawn from the mass of data thus far secured.

Project Subcommittee Number Three undertakes the following schedules:

Make a comprehensive investigation of the magnitude and distribution of power system residuals, transient and steady state including the controlling factors and methods for limiting the magnitude of the residuals and their inductive effects, with particular reference to different methods of grounding neutrals. To carry out the project, extensive tests will have to be made on long transmission lines where conditions with respect to transpositions and grounding can be varied and controlled. Certain characteristics of transformers and machines will have to be studied in the shops and laboratories of the manufacturing companies.

What we may expect from this study is along the following lines:

The completion of this project will yield authentic quantitative data on the effects from the standpoint of residuals of various conditions of operation in power systems under different circumstances, such as capacity of system, size and type of network and protective methods employed. The efficiency and practicability of different methods of control of residuals, a matter of great importance in problems of inductive coordination, will be determined.

Many investigations have been made on power systems located in different parts of the country, but additional tests must be carried on on a number of systems that present varied characteristics, the reason for this being obvious.

A Difficult Problem to Analyze

Project Subcommittee Number Four has a most difficult problem to analyze:

The object of this project is to determine the effect on speech reception of noise generated in telephone receivers by external causes. Such a study is necessary in order that efforts to reduce noise may be guided by adequate knowledge of the problem. An important part of this investigation is the study and further development of methods of measuring noise and a survey of the existing conditions in respect to noise on telephone circuits.

Much study has been directed along these lines, and a large amount of data secured from numerous sources and considerable progress has been made.

Measuring the Unwanted Currents in the Power System

For Project Subcommittee Number Five:

> The objects of this investigation are to determine whether there are practical improvements in wave shape which can be made and what steps would be required to secure such improvements; and to develop means and methods for rating wave shapes in respect to their relative effects from an interference standpoint. This investigation will include the collection of data regarding wave shapes of rotating machines of different sizes, classes, and designs, under different conditions of load and excitation, and regarding wave shapes of operating systems. It will also include an economic study involving a comparison of the relative advantages obtainable by different methods of improving wave shape in relation to corresponding benefits obtained.

Important data on this subject has been, and is being, secured from many sources.

The work of Project Subcommittee Number Six is devoted to the study of joint use of poles which will include a determination of the coefficients of induction under conditions of joint use, studies of induction with types of telephone and power circuits commonly involved in joint use, and studies of transpositions and other means of minimizing interference.

A situation where there was joint use of poles between distribution, power and lighting circuits, and telephone circuits in cable, was made available for the use of this Subcommittee. The location was Minneapolis, Minn. The system of the local power and telephone companies was used by this Subcommittee and they secured a very large amount of valuable data which has been incorporated in a progress report. A limited number of copies of this report have been published.

Interference with Carrier Current Communication Channels

Joint pole use between power circuits and open wire telephone circuits is now under study at a location near Elmira, N. Y., and will probably be concluded within the next six months. The time involved on these two investigations has been something over four years and most of this time was devoted to the actual work of securing accurate data.

The most active of the remaining Project Subcommittees is Number Nine which has to do with interference with carrier current communication channels. This subcommittee has carried out studies which have provided data that is of use not only in connection with its own problem, but is of importance to many of the other Project Subcommittees.

The scope of this Subcommittee's work can be stated as follows:

Some interference has been experienced with carrier telephone circuits. The art of carrier current transmission is relatively new, but is rapidly expanding, and this investigation is undertaken in order that means may be available for properly dealing with such situations before they have grown too widespread and serious. An important phase of this investigation is the study of interference between carrier systems on power circuits and carrier systems on commercial telephone lines.

The information that this work may be expected to develop is shown herewith:

> 1. Determination of all sources of carrier frequency interference from power systems, including carrier systems superimposed on power lines and their general importance.
> 2. Sufficient information regarding coefficients of induction at carrier frequencies (as compared to coefficients at lower frequencies) for purposes of practical estimates of interference in cases of exposure.
> 3. Determination of importance of telephone line and apparatus unbalances at carrier frequencies under known conditions of induction.
> 4. Sufficient information regarding carrier frequency transmission and attenuation characteristics of power lines and apparatus for purposes of practical estimates of inducing quantities at an exposure in terms of their magnitudes at another point (including at this point, the output terminals of high frequency generating apparatus in the case of power line carrier systems).
> 5. Sufficient information regarding longitudinal propagation of carrier frequencies in telephone circuits for purposes of practical estimates of induced effects at terminals or other points at which unbalances exist.

So far most of the work of this Subcommittee has been carried out in the Northern part of New York State. Work is also being carried on in the Southern part of New Jersey, where facilities are provided which will permit full time prosecution of the work so long as this or other Projects need to use the facilities built and provided for at this point.

Project Subcommittee Number Seven deals with the question of power level and sensitivity of telephone circuits. Knowledge of this subject is quite important on considering problems of coordination. The mission of this Subcommittee may be expressed in the following paragraph:

> The ratio of extraneous power to the power used for speech transmission is a factor of direct significance in determining the interfering effect of induction in a telephone circuit. The practicability of preventing interference by raising the power level of telephone circuits is to be considered in this Project for both local and toll circuits.

Several reports have been made by this Subcommittee and some technical information has been secured.

Project Subcommittee Number Eight deals with the question of selective devices. This project provides for a study of the use of such devices as resonant shunts and filters for the suppression of voltages and currents of particular frequencies. Such devices are theoretically applicable to both power circuits and communication circuits. This Subcommittee faces a rather difficult task; and, while a large amount of work has been put on this subject, the results can hardly be stated in a paper of this kind. However, considerable progress is being made that is of real value.

Can the Transmitters and Receivers Be Modified?

Project Subcommittee Number Ten deals with the question of telephone receivers and transmitters. This includes a study of the relation of the frequency response characteristics (sensitivity and efficiency) of telephone receivers and transmitters to noise interference and acoustic shock.

Project subcommittee Number Eleven is devoting its attention to a study of special devices and methods. They will consider such subjects as drainage connections, neutralizing transformers, shielding systems, booster transformers, and sectionalizing transformers. Some of these methods apply to power systems, others to telephone systems, and a few of them apply to both.

This review of the work that has been placed in the hands of the Joint Development and Research Subcommittee should bring to mind quite forcibly the difficult work required to determine the nature and content of a code of practices that will be acceptable to all of the interested parties concerned.

Amplifier Takes a Look at Agriculture

By AMPLIFIER

I SUPPOSE that about seven men out of every ten reach a period in their lives when they feel a great urge to visit some farm they have known in their childhood. In some cases it is a farm on which they were born and spent their boyhood days getting up at daylight and helping with the chores, trudging to school in the winter or going fishing and swimming in the summer, winding up the day by again helping with the chores and reading by an oil lamp in the evening. In others it may be the farm of one's grandfather, known only as a great place to go to in the summer with a cool pantry where one could always find a piece of fresh pie or a big jar full of cookies. In still others it may have been a farm taking "paying guests" where one's father, being in moderate circumstances, could secure a pleasant vacation for the whole family without too severe a strain on his pocketbook.

TO those of us who have reached a comfortable and reminiscent post-middle age there always remain certain very definite impressions of this farm. There was the Saturday night bath in a wooden or tin tub by the kitchen fire, with hot water from a tea kettle and cold water from a pail. There were the oil lamps in the kitchen and dining room, with candles when bed time came and an old fashioned lantern if one had to make an excursion out of doors after dark. The laborious weekly butter making with a hand churn was always an event because of the fresh buttermilk—a product of the farm little known to the present generation. The feeding of the chickens, pigs, horses and cattle were the chores if the boy lived there and exciting incidents if simply a visitor. The same was true of gathering eggs, or honey, or apples, or vegetables from the kitchen garden. Chopping the day's supply of wood was manual labor in the one case and a delightful privilege in the other.

The writer had one of these urges during the holidays. In this case the farm was one which originally belonged to my grandfather and was subsequently occupied by an uncle who in turn was succeeded by a cousin. I never could understand why this cousin stayed on the farm—to me it was the farm of my boyhood days. I had not seen it, nor him, for many, many years but I knew from occasional letters that he must be fairly well-to-do. I knew that he had a telephone, a radio, an automobile which was considerably more than a flivver and I knew that he made frequent trips to the city. But the farm, to me, was still the farm of many years ago when a trip to the city meant an all day ride behind a team of horses.

THE USEFUL PLOUGH

An Old Song that needs a slight revision.

A country life is sweet!
In moderate cold and heat,
To walk in the air, how pleasant and fair,
In every field of wheat,
The fairest of flowers adorning the bowers,
And every meadow's brow;
So that I say, no courtier may
Compare with them who clothe in grey,
And follow the useful plough.

They rise with the morning lark,
And labour 'til almost dark;
Then folding their sheep, they hasten to sleep;
While every pleasant park
Next morning is ringing with birds that are singing,
On each green, tender bough,
With what content and merriment
Their days are spent, whose minds are bent,
To follow the useful plough.

So, having nothing better to do, I decided to take a look at the Middle West (about which some of the middle western power companies do so much talking) and pay him a brief visit. I planned the trip with the idea that I would arrive at the farm early in the morning and leave the same evening—I had no desire to go to bed by candle light in an unheated bedroom or to get up at daylight for breakfast because the chores had to be done. I stayed a week.

Arriving at what I had remembered as a country village, I found a thriving town, the main street of which looked almost like a miniature Broadway, with its electric signs, two moving picture houses and illuminated store windows. In twenty minutes I was at my cousin's house—a trip which took over two hours in the old days. But what a house!

THE old house had been torn down these many years and a new one built across the road. Hot water heat by means of an electrically controlled oil heater in the basement. A reading room, dining room, locker room and showers with hot and cold water—all in the basement—for the "help." Electric lights—not the single unshaded electric bulb suspended from the ceiling with a cord which most people associate with electric lights on the farm, but floor lamps everywhere, with reading lights in the bedrooms.

Gone were the tin or wooden tub and the outside hand pump, their places being taken by two bath rooms with running water. In the kitchen was an electric range. In a large room adjacent to the kitchen I saw an electric washing machine, an electric iron, a vacuum cleaner, and an electric refrigerator. In fact my cousin's house was as completely equipped and as up-to-date as any city house I had ever been in. Housekeeping was as simple as in a modern New York apartment.

The outside of the house was quite as interesting as the inside. Running water in the barns and all other outbuildings. The milking was done with electric milking machines while feed was ground with the help of an electric motor. The chicken plant was lighted with electric lights turned on and off by an automatic clock. There were practically no chores, for almost everything was done by electricity.

"How come?" I asked.

"WELL of course," he answered, "I didn't get everything at once. As you know I graduated from an agricultural college and I have always had an idea that scientific farming would pay quite as well as running a drug store, or making automobiles or following a profession. When father died he left a little money and I was faced with the choice of proving my ideas or selling the farm and going into business. I decided to practice what I had been preaching.

"I knew I ought to have electricity for both power and lights and here I ran into the first problem. The nearest power company is about six miles away. The gang running it are progressive and have spent a lot of time and money on what they call rural electrification. Their lines extend in many directions beyond the limits of the town and they have a rural service department with a small staff of men who know about farming and who also know how electricity can be employed efficiently and economically on the farm. I called on this outfit and after I had explained what I wanted they promised to investigate.

"But when they investigated they found that I was located in the opposite direction from the town from the high tension line that brought the current from an extensive interconnected system. Service had only been carried about three miles in my direction and the people living beyond that, with the exception of myself, did not want electricity. They are an old fashioned lot who seem to feel that the ways of their grandfathers are quite good enough for them and, according to my standards, are altogether shiftless. This meant a gap of three miles between the nearest available current and my house.

"Now it costs approximately $1,000 a mile to extend a farm power line in some localities and in others the initial cost is much higher. With all the other expenditures which I was planning and the cost of new equipment I did not feel I could build the line myself. What was the company going to do about it?

"AFTER a number of conferences we decided to survey the territory in another direction. At an angle of about 45 deg. there is another power line of the same company with an intervening gap of slightly more than three miles. But my neighbors in this direction are more progressive and it took very little effort on the part of the company and myself to sell them the idea that they ought to have electric service. As a result a line was eventually run along this route.

"Now, you see," he went on, "I have one of the 350,000 electrified farms in the United States. Like most other farmers I wasn't able to acquire at once all of the equipment which you have seen. In fact it has taken me three or four years. Implement dealers, as well as the power companies, often assist in the purchasing of equipment and appliances for the house and barns but these things all have to be paid for eventually and no farmer, no matter how sure he may be of his ultimate success as a scientific farmer, wants to shoulder too great a financial burden."

"I suppose there are a lot of problems connected with this idea of farm electrification," I said, because it was time for me to say something and I knew less than nothing about the subject.

"Indeed there are," he replied, feelingly. "There are attitudes of mind and prejudice in this whole farm electrification business as well as money and energy and vision and sentiment. It is one thing for a farmer like myself to want electricity on his place and quite another thing when the power company is called upon to solve the problems involved in undertaking to provide current. As nearly as I can make out, the light and power industry must have spent hundreds of thousands and, perhaps, even millions of dollars on these problems.

"What are these problems you talk so much about," I asked.

"Well, in the first place," he replied, "there is the problem of capital investment. How to get the current to the farmer with an investment sufficiently reasonable that it will earn a fair return eventually. About the only thing the farmer thinks about when he first considers electricity is electric lights, and the second is running water. The amount of current which he will consume for these purposes is mighty little. In order to give him these two conveniences the light and power company will have to invest ten or more times as much as they have to invest to give service to a city customer.

"So the company is faced not only with the problem of the number of customers it can get to the mile of line (which it knows must be small) but with the problem of educating the farmer as to how he can use electricity for all sorts of purposes profitably. A rural power line must earn money just as an industrial power line must earn money if it is to continue to exist. Dollars demand wages just as my hired men demand wages, and the problem of the wages of the dollar working for rural electrification is a serious one.

"Second, there is the problem of stability of service. The farmer, depending on electrical power to do the work of his farm, is in a mighty bad fix if there is a constant interruption of service and he is constantly forced to return, even temporarily, to man power to do the work. Once equipped electrically there is no merit in equipment that depends on manual labor. Of course this problem is being solved by interconnection. In many sections of the country the rural districts as well as the small towns and villages are receiving the same 24-hour metropolitan service as the big cities and this is all due to the fact that the isolated plant is disappearing and its place being taken by the great interconnected system serving areas that cover not only whole states but, in several instances, two or more states.

"THIRD, there is always the problem of the farmer's financial condition. Many farmers who today are prosperous because of electrification combined with scientific methods of farming were as good as bankrupt a few years ago. In order to turn them into profitable customers the light and power company may have acted as banker in the purchase of equipment. This is simply another phase of the financial problem which sometimes may be expensive but which, as I understand it, cannot be reflected in the rates."

"Well," I said, "for a chap born on the farm you seem to have learned a lot about something that I never heard of. Have you anything more in your bag of tricks?"

He laughed. "Oh, yes. I am going to take you tomorrow or next day to a place a few miles from here occupied by an old German couple who are friends of mine. You will find it mighty interesting."

And so I did. This couple had wanted to get away from a congested city and factory work. They had acquired about 15 acres of relatively inexpensive land and took to it some of the things they had seen and learned in factories. The result is what I would call an industrial chicken ranch.

They have about 1100 fine Leghorn chickens, housed in shed-type poultry houses designed by experts from the state capital. Each house is a unit, holding from 100 to 150 hens. These units are identical and are systematized like a factory. They are arranged for "straight line production" with conveyors and give a maximum output with a minimum of human labor.

The nests are what my cousin told me is the modern "trap" type, hinged to the wall so that the litter can be dumped by a single lifting operation. A canvas belt conveyor runs the entire length of the house (replacing the old style dropping boards) and is cleaned by the starting of the electric motor. The manure is dumped into a cart at one end of the row of houses and conveyed directly to a pit. The same conveyor is used for removing the litter from the floor of the houses with a minimum of dust, dirt and effort.

Of course, the houses are electrically lighted. These lights are turned on automatically by a time switch so that the chickens are eating and laying while our German chicken farmer and his wife are still sleeping. He told me that the increased egg production from the use of electric lights paid, in one single month, for the cost of the line extension and the wiring of his house and out buildings. Incidentally he also told me that the water is electrically heated during freezing weather for about the price of one egg a day.

This farmer feeds a scientific mixture of grain, meat scraps and vitamin food. He buys whole grain from the elevator, the mill, or a neighboring farmer; whichever is cheaper. The grain is raised to a second story in his granary in a grain elevator. It is fed into a hopper made from an ordinary vinegar barrel. From the barrel it goes by gravity through a chute made from an old barn ventilator, into a hammer type grinding mill, driven by a five horsepower electric motor. It is ground rapidly to any fineness he wishes, without further attention or care. It goes from the grinder into a bin beneath the mill. From there it is weighed out into proper proportions, dumped into a motor driven mixer, with the correct balance of other food and is thoroughly mixed and sacked. All of this in less time than he formerly spent traveling back and forth to town having his grain ground and waiting at the mill. The cost of doing these operations is less than he paid for grinding. In fact he figures that his saving on feed will pay for the installation within one year.

The 250 gallons of water a day, necessary for the chickens, are pumped by a motor driven pressure type of water system directly into the hen house.

This old German and his wife seem to me to be nothing more or less than industrialized chicken farmers. They are using their brains and putting electricity to work; making it earn money for them. It is production at a minimum cost. With it their house is equipped with all of the comforts of the city home. They are prosperous and contented and must be good customers for the company that serves them.

Now I am back in New York thinking about these things. I think of my grandmother, a household drudge all her life. I think of my grandfather, a hard-working, round-shouldered man, old, years before his time. What would they think if they could see their grandson's farm—the same land and the same products—but no longer a farm as it was understood in the old days. It's a great old world and we who live in the city perhaps are not so smart as we think we are.

The Philanthropy of Tree Clearance Programs

By G. M. CODDING*

TO the public utility company a program of line clearance means a decided lessening of service interference from tree growth. To the tree expert company it means an opportunity to bring to bear on a practical public problem the scientific knowledge, experimentation and results of actual work for private clients who demand a certain high type of work.

To the public, what should this program of line clearance signify? Not alone the desire of the utility to prevent any needless handicapping of distribution, this is the *prima facie* significance—beyond, and as important, is the tremendous philanthropic contribution of the utility toward civic betterment. In an age of mechanical and material improvement, the public utilities companies in their line clearance programs have accomplished, along with the elimination of a great percentage of service interference, the following:

1. An æsthetic improvement to street trees by pruning and shaping.
2. The elimination of tree disease breeding places by the removal of dead and diseased growth.
3. The lessening of danger hazards to pedestrians by the removal of dangerous limb growth.
4. The elimination of unsightly "looping off" of trees (the once prevalent method of securing clearance).
5. A decided result in building up, through example, a community pride in the possession and consideration of shade tree growth.

Horticultural statisticians have compiled the actual value of a shade tree in dollars and cents. Real estate experts know the value of shade trees to a home; landscape architects have their firm belief in the effect which shade trees have on the appearance of a community; sociologists and child phychologists have demonstrated the effect which shade trees have in the character-molding of individuals. The city without shade trees is the city without the dignity and home-like security of those communities which are known and identified by their arching elms, symmetrical maples, stately poplars or sturdy oaks. The health of a community is vitally affected by shade tree growth: leaves are continually, through transpiration and chemical processes, sending moisture particles into the air we breathe, they are absorbing, through the stomata of their leaf tissues, noxious and harmful gases, their growth is breaking up the severe heat of a summer sun, giving cooling and refreshing shade.

It is worth while and commendable, this little-noticed philanthropic contribution of the utility. The method of treatment of one of our greatest natural resources, the shade tree, by the utility is proof to us, who may be a trifle emphatic in our desire to perpetuate shade tree growth, that there are yet great material organizations which are not inclined toward the fallacious opinions rampant today that progress is a thing to be measured in material gain.

Dr. E. P. Felt, Director of the Bartlett Tree Research Laboratories in Stamford, Conn., estimates the trees for which the town of Greenwich, Conn., is celebrated, as "not less than one-fourth of the town's assessed valuation," which would put the figure at approximately $25,000,000! Such a valuation, made after a careful study by one of the leading authorities on shade tree insects, would seem to indicate that the public utilities companies are handling the shade trees, by which their product must be affected, in a manner befitting a tremendous civic asset.

---

Some General Electric Company Developments of 1928

By JOHN LISTON

THE year 1928 exceeded all previous years in its volume of production of electrical equipment. Advances in design and improved materials resulted in increased efficiencies in practically every phrase of the industry from the generation, transformation, and distribution of electric energy to its application and control.

A 94,000-kw. tandem compound unit (Fig. 1), the largest completed unit of its type, was placed in service, and work was nearing completion on a 160,000-kw. tandem compound and a 208,000-kw. cross-compound unit, each representing the maximum capacity in its type.

Concurrently with the increase in the mileage of our lighted airways, the lighting units for both route and landing field service were standardized, and more powerful beacons and floodlights were provided to increase the factor of safety in landing at airports.

The outstanding accomplishments in research include the use of the lightning-actuated type of cathode-ray oscillograph, which was applied in the study of lightning phenomena in the field on a truly engineering basis, the production of a 50,000,000-cycle tube with a ten-kilowatt output, and photoelectric tubes of greatly increased sensitivity, which have aided in the notable advances made toward the achievement of practical television. The use of vacuum tubes for purposes other than radio communication was extended to such diverse applications as the control of furnace temperature, the automatic leveling of elevators, and the remote indication, control, and supervision of the equipment of power stations and substations.

The automatic control of generating equipment was applied to a hydro-electric station of 100,000-kv-a. capacity; and the mercury-arc power rectifier was improved in both capacity and performance and utilized in automatic substations to a greater extent than in previous years. A feature of great potential value was the development of a practical and simplified form of outdoor substation for farm service, which enables the farmer to receive current at normal operating voltages directly from high-tension transmission lines. Series capacitors were utilized, for the first time on a commercial basis, for compensating the reactance on a transmission line.

Turbines

The year was notable for the advent of the first two all-high-pressure stations equipped exclusively with 1400-lb. boilers and large 1200-lb. turbines.

A thorough study had been made of the dollar economy of various steam pressures and cycles of operation, and as a result the turbines will have steam conditions of 1200 lb., 725 deg. total temperature with boiler reheat to 750 deg. between the high and low pres-

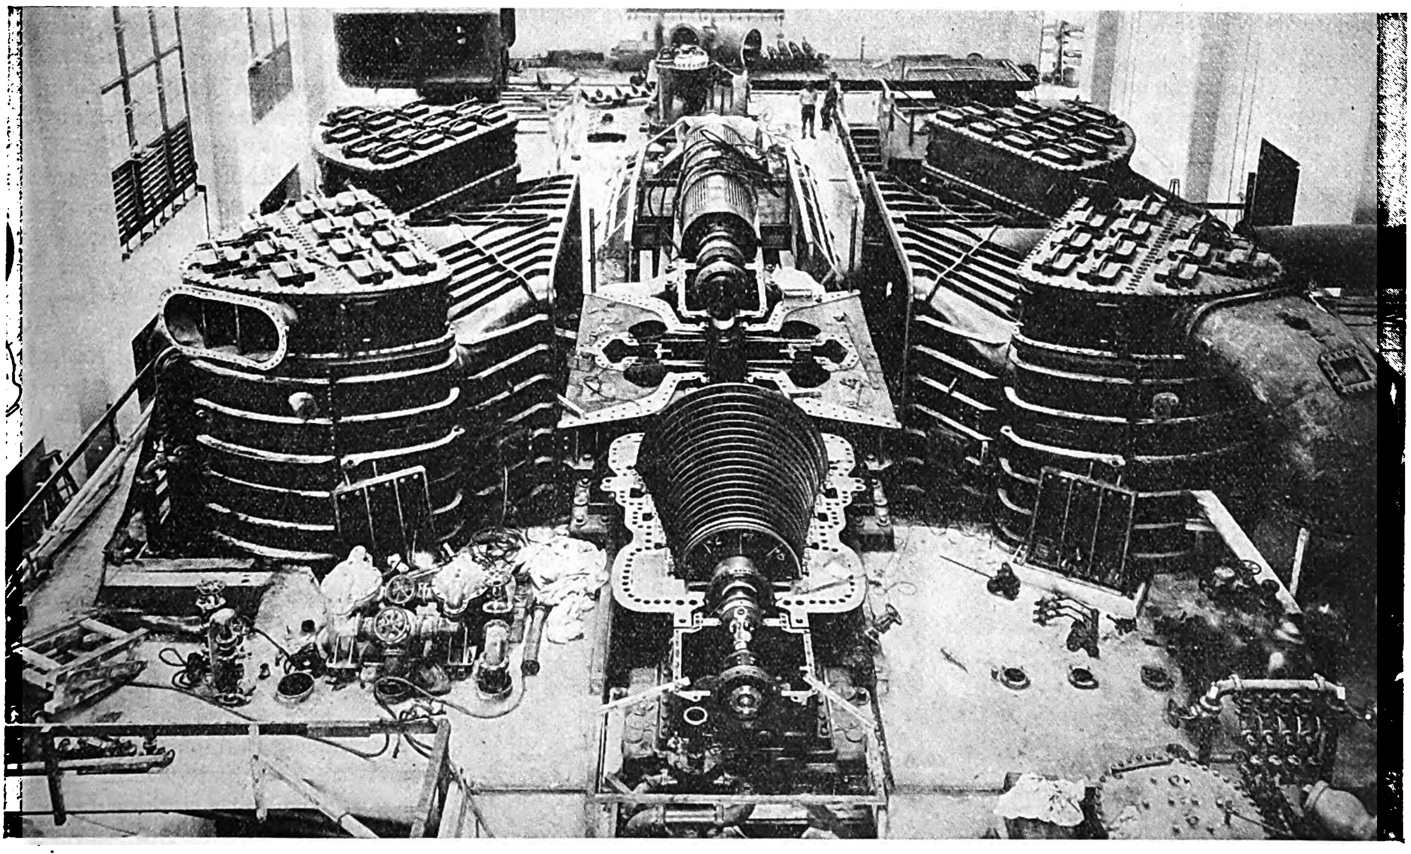

Fig. 1—94,000 kw. turbine generator set partly installed in The Long Beach Station of The Southern California Edison Co.

sure elements of the cross-compound turbines. Economy data from ten representative high-pressure and high-temperature power plants have shown a practical realization of the theoretical gains resulting from higher steam pressures and temperatures (Fig. 2).

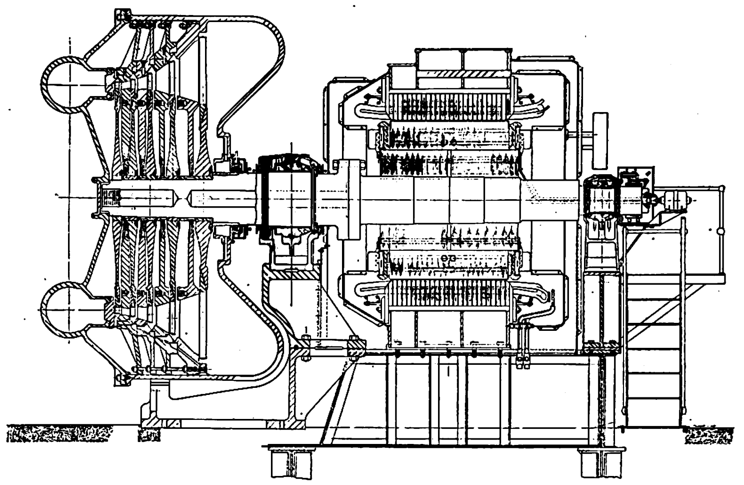

Fig. 3—Cross section of 10,000 kw. Mercury turbine and generator

Emmet Mercury Vapor Process

The mercury vapor power plant equipment (Fig. 3) installed in the South Meadow Station at Hartford (Conn.), was put into commercial service during October, 1928, and operated in the most satisfactory manner.

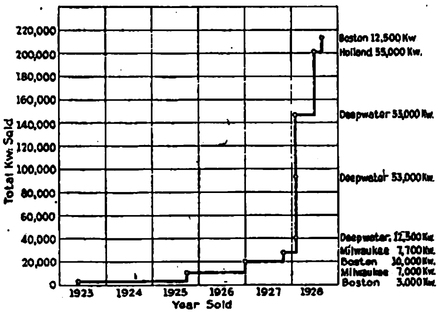

Fig. 2—Growth in the use of 1200 lb. steam pressure with G. E. turbines

The first runs made have indicated the desirability of certain modifications that will require some few weeks, and meanwhile it should be appreciated that no fundamental changes are involved, but merely minor adjustments. The data taken from the log sheets were highly gratifying.

Table I gives data on the designed conditions of the equipment.

TABLE I

Output of mercury turbine	10,000	kw.
Speed of mercury turbine	720	r.p.m.
Steam produced per hour	125,000	lb.
Steam pressure	350	lb. gauge
Steam temperature......	700	deg. F.
Mercury vaporized per hour	1,150,000	lb.
Temperature mercury vapor	884	deg. F.
Pressure vapor at mercury turbine..........	70	lb. gauge
Vacuum in mercury condenser	28	in.
Temperature mercury exhaust	458	deg. F.
Gas temp. beyond mercury liquid heater.....	950	deg. F.
Gas temp. beyond steam superheater	650	deg. F.
Gas temp. beyond water economizer	480	deg. F.
Gas temp. to stack......	280	deg. F.
Air temp. entering furnace	390	deg. F.
Coal burned per hour....	14,500	lb.
Heat in coal per pound..	14,500	B.t.u.

Motors

An improved single-phase repulsion-induction motor, in sizes ranging from ¾ to 2 hp. at 1800 r.p.m., is of the constant-speed high-starting-torque type for general application.

Rapid development in the art of designing capacitors has made this product so reliable that there has again arisen a demand for single-phase motors utilizing essentially squirrel-cage induction rotors wound like those of two-phase machines but with a capacitor across one phase to afford proper starting torque. Such motors were produced in sizes from 1-6 to 15 hp.

Some two-speed synchronous motors rated 50/25 hp. 257/128 r.p.m. were constructed for driving ammonia compressors. They are the first motors of this type to be used for this service.

During the year the line of synchronous motors having induction-motor characteristics, making them suitable for general purpose application, was extended to sizes as large as 500 hp. at speeds of 1200 to 600 r.p.m. These motors utilize a skeleton-frame construction and are equipped with a compact direct-connected exciter.

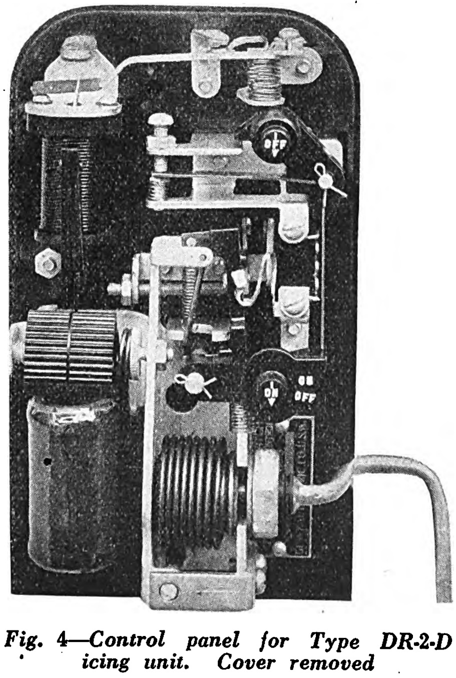

Fig. 4—Control panel for Type DR-2-D icing unit. Cover removed

Electric Refrigeration

There were no fundamental changes in the design of the household type of refrigerating machine although some minor modifications were incorporated to improve efficiency. One of these was the introduction of an oil conditioner which maintains the oil bath at a temperature which prevents condensation of the refrigerant in the base, thereby maintaining the oil in a state which gives the best possible lubrication.

In order to provide for conditions where space in the household is restricted, a machine was devised in which the compressor unit was modified and mounted with minor alterations on a smaller box top and assembled in a cabinet of 3½-cu. ft. of food-storage capacity.

The control (Fig. 4) was improved by a device which compensates the overload trip for room temperature and by an attachment which allows the adjustment of the temperature of the food-storage compartment to be made from the outside of the panel.

A new cabinet was also devised which consists of an outer shell of essentially one piece, insulated from an essentially one-piece interior with a new type of insulating material. No wood is used in its construction; a special condensate material being used around the door and door opening to join the inner lining to the outer shell. Metal hooks for supporting the food shelves were eliminated.

Transformers

The growing demand for the load-ratio control type of transformer is indicated by the fact that about 25 per cent by kv-a. of all power transformers and nearly 40 per cent by kv-a. of all transformers above 20,000 kv-a. are now provided with load-ratio control. Over 2,000,000 kv-a. of G-E transformers so equipped are now in service.

All schemes of load-ratio control involve sufficient reactance to limit the current flow when passing from one tap to another. A separate reactor may be used or the reactance may be inherent in the transformer.

The efficiencies of modern transformers are so high that new records are rarely made. During the year, however, two 20,000-kv-a. units attained a full-load efficiency of 99.52 per cent. (Fig. 5).

Farm-Power Substations

A small transformer stepdown substation was developed to permit power companies to take power safely and economically from high-voltage lines to supply the farm and the small rural community.

The cost of reaching and serving scattered rural loads is prohibitive in many cases as long low-voltage distribution lines run into relatively large capital investments that are not justified by the returns secured. To tap high-voltage trunk lines (66,000 or 110,000-volt) has heretofore involved expensive oil circuit breaker and lightning arrester equipment.

The new substation is so designed that a material saving is accomplished by:

1. Designing the high-voltage insulation throughout so that its resistance to lightning and system voltage breakdown is greater than the resistance of the high-voltage trunk-line insulation itself. The high-voltage line insulation protects the small substation.
2. Substituting for the oil circuit breaker, relays, current transformer, and disconnecting switch, an interrupting and disconnecting device consisting of an expulsion fuse and current-limiting resistor unit, which will protect the high-voltage line against interruption due to faults in the step-down transformer or substation structure with negligible disturbance to the system.

The substation is designed for connection between one conductor of the high-tension line and ground, as the majority of high-voltage lines are operated grounded. The station comprises one high-voltage fuse and resistor, a single-bushing transformer and gives 2300-volt single-phase 60-cycle service. Low-voltage metering equipment, cutouts and arrester are included.

A number of novel features were incorporated (Fig. 6) to effect economy with an unusual degree of reliability. The transformer employs only one bushing. One end of the transformer winding is solidly grounded inside the tank. The oil in the tank and in the bushing is common, with a conservator mounted on the top of the bushing. Adequate shielding and clearances between the high-voltage and low-voltage windings prevent reflection of over-voltages to the low side by capacity coupling. The core and coils are designed to minimize the possibility of telephone interference. The magnetizing current is practically negligible.

The complete 66,000-volt substation sells for an amount comparable with the cost of building about a mile and a half of distribution line and should give more reliable service and better voltage regulation than the average rural-distribution line.

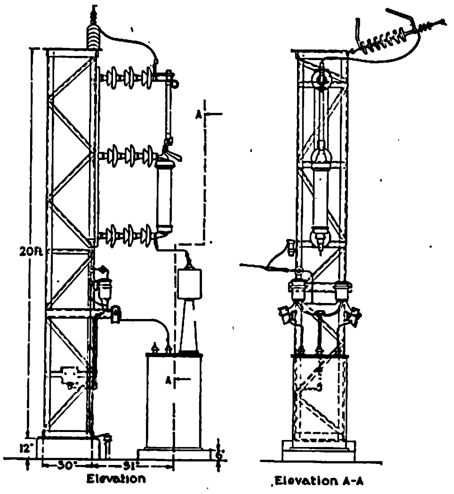

Fig. 6—Structural arrangement of outdoor farm-power substation equipment

Lighting

A preliminary estimate of the number of incandescent lamps sold in the United States during 1928 (Fig. 7) indicates 319 million large and 240 million miniature lamps. The former is an increase of about 1½ million (about a half of one per cent) and the latter an increase of about 20½ million (about 9½ per cent) over the previous year. These sales are the largest in the history of the industry.

The present standard line of lamps with inside frosted finish, which was introduced a little over two years ago, made excellent progress in replacing the corresponding old types of lamps in the straight-side clear bulbs. The demand for the new lamps is now about 98 per cent of the total demand for standard wattages. The remaining demand of 2 per cent for the old type lamps comes from special services where clear-bulb lamps are required.

The price trend for lamps has been downward for the past seven years and current prices for both large and miniature lamps (Fig. 8) show marked reductions as compared with those of 1914. At the close of the year, large lamp prices were 49.2 per cent and those for miniature lamps were 48 per cent of the corresponding 1914 figures.

A notable development was the introduction of the inside-colored lamp to supersede the outside-coated or sprayed-finish type previously used. While bulbs of natural-colored glass have been used to some extent, their relatively high price has limited their application.

Street Lighting

Intensive white-way lighting, *i.e.*, street lighting delivering from 300 to 2000 lumens per foot, was inaugurated in 1916 by the "Pathway of Gold" in San Francisco. Since that time, street illumination of this character has been adopted by more than 50 cities in the United States, the additions during the year including the cities of Detroit (Mich.), Kansas City (Mo.), Oakland (Cal.), Houston (Tex.), and Washington (D. C.).

Washington Boulevard, Detroit, became the best lighted street in the world with a new five-light ornamental illumination system. The lighting standards, placed in double rows along the parkway in the middle of the street, are of record size, giving an illumination per pole of 10,500 candle-power, which exceeds State Street, Chicago, heretofore the best lighted street, by more than 1000 candlepower. This was the first installation to utilize large Mazda lamps in groups of five to a standard.

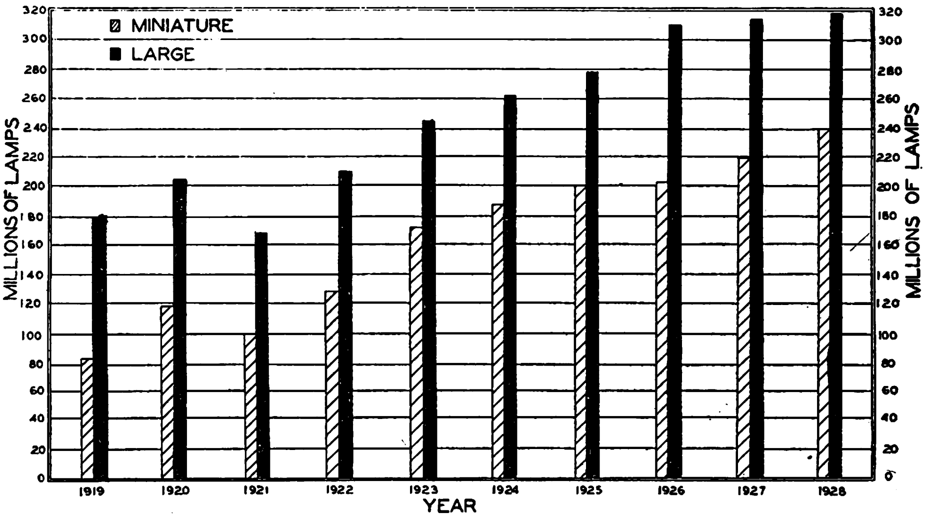

Fig. 7—Number of incandescent lamps sold in the United States, 1919-1928 (1928 *estimated)*

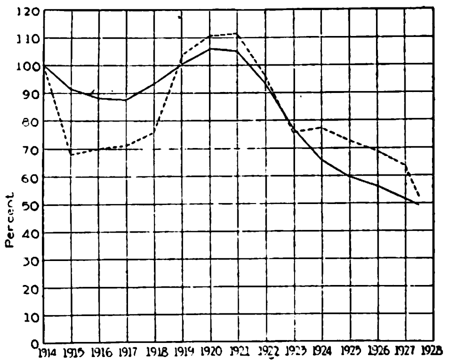

Fig. 8—Reductions in prices of Mazda Lamps since 1914

Floodlighting

There was an increased use of floodlights for the illumination of athletic grounds and stadiums to permit the holding of practically every type of open-air athletic contest at night. There was also a notable increase in the number of illuminated fountains; and the demand for this form of nocturnal decoration resulted in the practical standardization of several sizes of fountains with complete specifications for masonry work, wiring, and projectors.

One of the outstanding floodlighting projects of the year is that of the Cleveland Union Terminal Building, which has a tower rising to a height of 710 ft. above the pavement.

The upper terraced section of the tower, approximately 275 ft. in elevation, is lighted by a total of 220 floodlighting projectors installed upon the various parapets and ledges of the tower. They are equipped with lamps ranging from 200 watts to 1000 watts in rating and have a total connnected load of approximately 140 kw. An average intensity of illumination of 15 to 21 foot-candles is produced upon the objective areas of the tower.

No colored light was employed, all relief lighting effects being obtained by white light. Careful attention was given to such factors as the elimination of objectionable shadows, the uniformity of light distribution, relief lighting and maximum beam economy by means of diffusing and diverging glass doors for the projectors.

Very striking effects were obtained during the three-day celebration of the dedication of the Los Angeles new City Hall. The tower of this building is capped by the Lindbergh Air Beacon, which has a visibility range of between 50 and 60 miles. The illumination of the City Hall during the celebration was accomplished by means of a temporary installation of batteries of floodlight projectors.

An unusual example of decorative lighting was arranged for a conclave of the Knights Templar in the City of Detroit. It consisted of a jeweled arch 144 ft. wide, stretched on 75-ft. towers at the curbs, and flanked on either side by 35-ft. towers carrying the arch over the sidewalks.

The 26,000 glass jewels in the arch were illuminated by thirty-six 18-in. arc searchlights equipped with varied color screens and delivering an illumination of 540,000,000 beam candlepower.

Design of High Voltage Outdoor Substations

PART III

A series of six discussions on design of outdoor substations originally presented at a meeting of the 1926-1927 Electrical Apparatus Committee, Engineering National Section, H. R. Woodrow, chairman. The meeting at which these discussions were presented was conducted by the Substations Subcommittee under the chairmanship of R. A. Hentz.

Substations discussed in this series are: The Philadelphia Electric Company, by Raymond Bailey; Detroit Edison Company, by S. M. Dean; (December, 1928) Commonwealth Edison Company, by B. G. Jamieson; Pacific Gas & Electric Company, by B. D. Dexter; (January, 1929) Duquesne Light Company, by G. Sutherland; (this issue) Alabama Power Company, by L. M. Smith (next month).

◆

DUQUESNE LIGHT COMPANY

G. Sutherland

During the last two years the Duquesne Light Company has installed two high voltage outdoor substations, stepping down from 66 kv. to 22 kv. The outstanding characteristics of these two substations are:

1. Simplicity of layout.
2. Isolation of trouble by separation of buses and apparatus.
3. Increase of insulation values.

The station plan is its wiring diagram. The 66 kv. transmission lines run straight through the station with taps to the transformer banks at right angle to the transmission lines, and the 22 kv. buses extend from the banks in straight lines. Unit type steel supports for the buses, oil circuit breakers, disconnecting switches and potential trans-

formers simplify the structural layout and efficiently eliminate the mass of steel prevalent in stations of earlier design. The elimination of high cost, high tension oil circuit breakers on the 66 kv. side of the transformer banks further simplifies the layout.

In order to isolate trouble the high tension buses are installed on 65 ft. centers with unit type supporting structures and the high voltage breakers are widely separated by their location in the lines.

Insulation values have been raised on both the high voltage and low voltage equipment from 30 to 60 per cent.

The details of the electrical layout are as follows:

On the 66 kv. side the transmission lines run straight through the station with taps to the transformer banks, the lines and taps forming the high tension bus. In order to bring two lines on the same tower into separate sections of the bus and avoid complicated crossovers 75 kv. single conducted cable is used to make the crossovers. Each incoming and outgoing line has a circuit breaker with its disconnecting switches, and a lightning arrester. Choke coils are used in these two substations although there is a tendency among our engineers to eliminate them because there is no evidence to substantiate their effectiveness. The transformers are tied to the bus through horned air break disconnecting switches only. There is, however, an oil circuit breaker between each pair of transformer banks

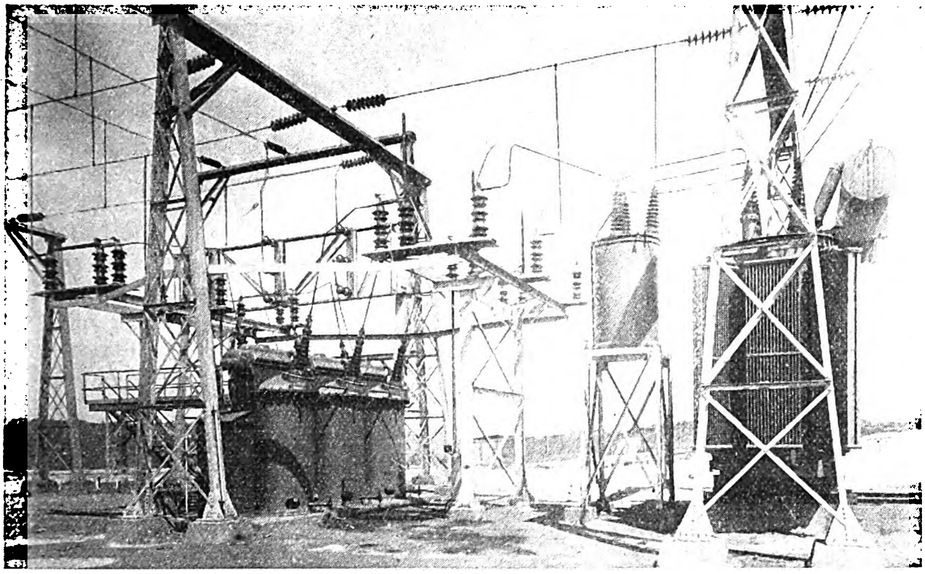

Fig. 29. *Auto Transformer, Metering Unit and Oil Circuit Breaker—Valley Substation—P. & O. Tie*

in order to confine trouble to one bank only. Insulator flashover values are 200 kv. wet and 260 kv. dry. These figures contrast with 120 kv. wet and 165 kv. dry installed in earlier stations.

This means that the stations are slightly over insulated, but the flashover value of the station equipment is considerably under the flashover value of the lines, the latter being approximately 275 kv. wet and 350 kv. dry.

On the 22 kv. side there is a main bus for each transformer bank with oil circuit breakers between sections. The auxiliary bus is unsectionalized. Duplicate lines to each distribution substation are tied to separate bus sections with oil circuit breakers for the main bus connections and disconnecting switches only for the auxiliary bus connections.

33 kv. three conductor cable is used in certain line connections in order to avoid overhead crossovers. Each line is equipped with station type lightning arresters with choke coils at one station only. At the other station 22 kv. choke coils are eliminated. The insulation flashover values are 140 kv. wet and 195 kv. dry, contrasting with former figures of 75 kv. wet and 105 kv. dry.

On the 22 kv. side of the station the increase in flashover value of the apparatus has been made possible by the development of better equipment on the part of the manufacturer. Our practice is to insulate for the next higher standard voltage above that which is used in normal operation. Thus, on the 22 kv. system 37 kv. equipment is used, selected to give the flashover values named.

The relay protection on the 66 kv. ring is of the two circuit balanced type. However, this has not been entirely

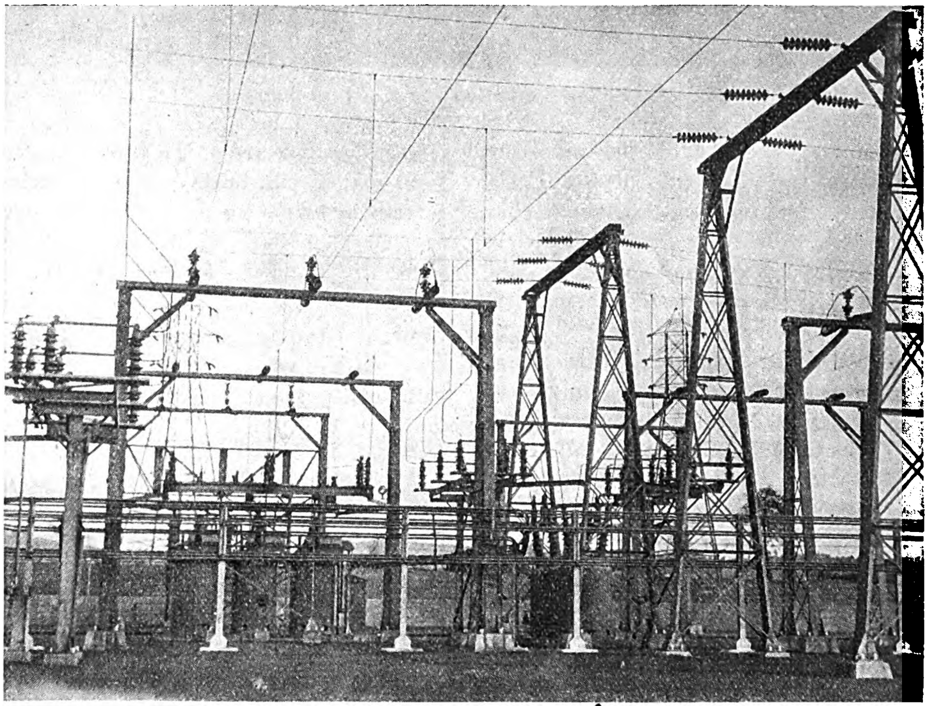

Fig. 30. *Valley Substation—66 Kv. Line and Bus Tie Breakers*

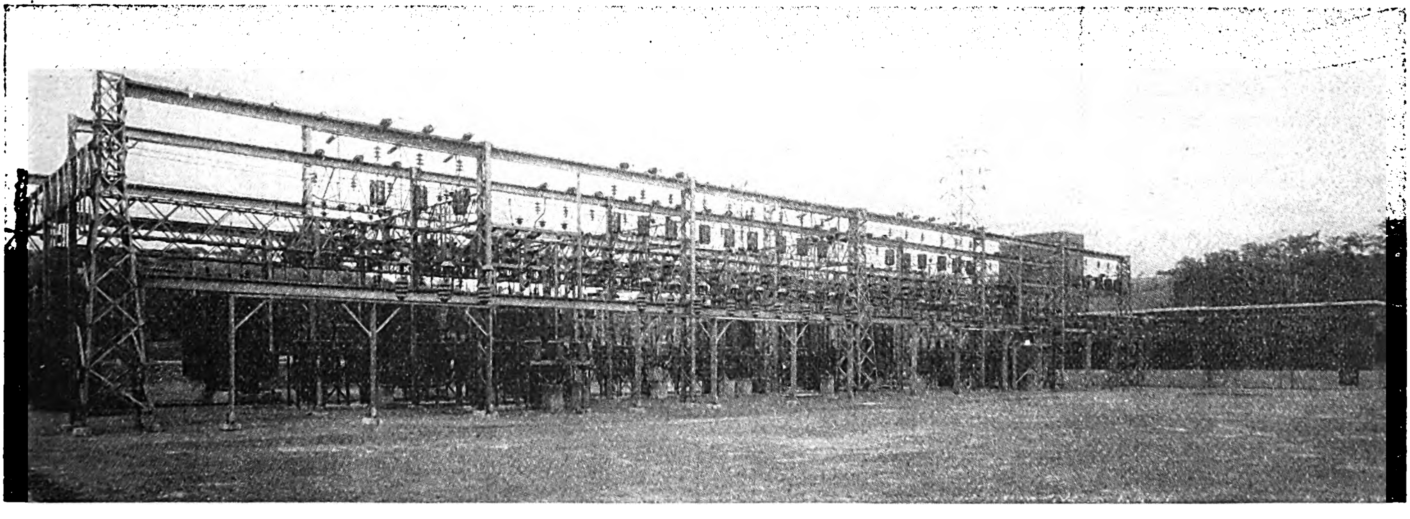

Fig. 31. *Pine Creek Substation—General View—22 Kv. Structure*

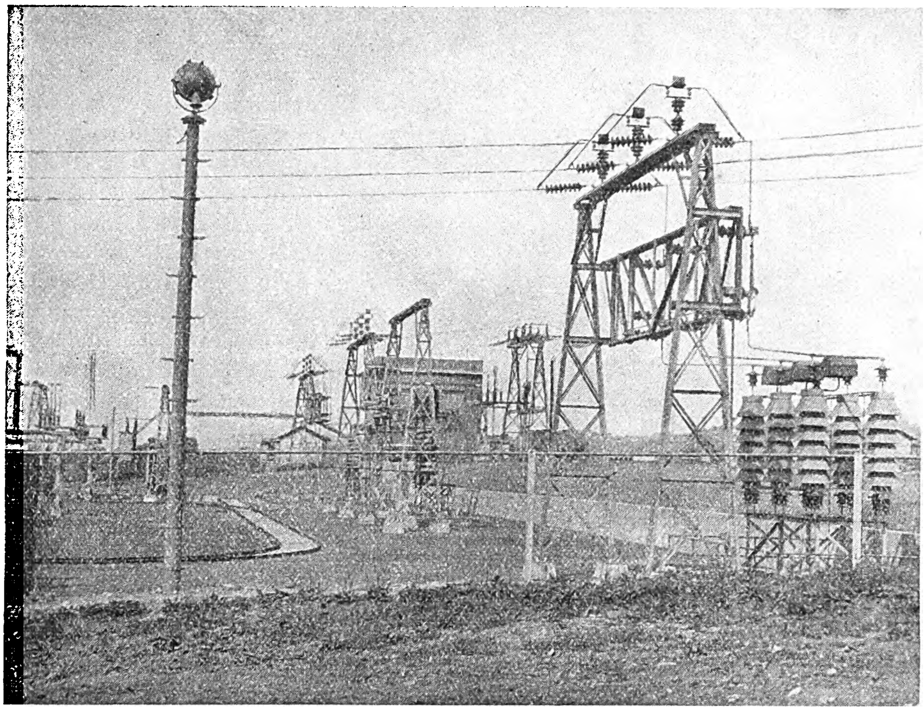

Fig. 32. Valley Substation—66 Kv. Line Entrances

satisfactory because of the numerous duplicate faults on the line and the necessity for backing up single line protection, which has not been entirely reliable. A directional overload and ground protection scheme is being considered for the 66 kv. lines. The 22 kv. feeders are equipped with directional overload protection and ground relays are installed experimentally.

Mechanical details are as follows:

The 66 kv. bus to bus distance is 60 ft. center to center in one station, and 65 ft. in the other. This difference is due to property limitations in the one case. The high tension bus is composed of 4/0 hard drawn stranded copper spaced 10 ft. phase to phase and is insulated with 7 disc insulators per string. Separate steel "A" frames support the bus, each structure being designed to withstand the stresses of three wires. Separate structures support the disconnecting switches and the potential transformers with their respective leads and, wherever the contour of the ground necessitates, the unit structures are on different elevations. The 22 kv. buses are spaced 16 ft. center to center with 4 ft. spacing between phases. The bus itself is of 2 in. copper tubing with taps of ¾ in. tubing. There is a common steel structure for all disconnecting switches and to support the buses, but the lightning arresters and the potential transformers are installed on unit type structures.

The equipment is both Westinghouse and General Electric. The 66 kv. oil circuit breakers are of the floor mounted type with 60 in. tanks and have an interrupting capacity of from 1,000,000 to 1,500,000 kv-a. In the two stations there are breakers of both the Westinghouse G-22 132 kv. type and the General Electric Company FHKO 39-60-C 88 kv. type. The 22 kv. oil circuit breakers are floor mounted with tanks of two diameters, 28 in. and 32 in. and with an interrupting capacity of 750,000 kv-a. Two types are used, the Westinghouse 0-331 and the General Electric Company FHKO 39-32-BY. The disconnecting switches are of the single vertical break type, gang-operated and interlocked with the oil circuit breakers by the Cory Interlock System. The lightning arresters are the covered gap valve type, both auto valve and oxide film. Wherever choke coils are installed the material is copper. The power transformers are 10,000 kv-a., single phase, connected 66 kv. Delta to 22 kv. Star with 3¾ ohm resistors in the neutral of the 22 kv. connections. The stations are designed for a first step capacity of 30,000 kv-a., one spare transformer being installed with the first bank and an ultimate capacity of 90,000 kv-a. with space for 120,000 kv-a. if required. Potential transformers are of the single bushing type on the 66 kv. system and single phase on the 22 kv. with 37 kv. insulation. The neutral resistor is of the outdoor grid type and has a rating of 800 amperes for 30 seconds.

Apparatus has been chosen and laid out to maintain the greatest practical separation and obtain highest insulation values consistent with economy and a well balanced engineering design. The slight increase in cost due to increased insulation has been well justified by the decrease in operation troubles.

Service Suggestions

NATIONAL ELECTRIC LIGHT ASSOCIATION COMMERCIAL NATIONAL SECTION
CUSTOMER RELATIONS COMMITTEE
H. T. EAST, *Chairman*, Public Service Co. of Northern Illinois, Chicago, Ill.
To formulate efficient methods of conducting relations between the customer, the public and the supply company, including such matters as taking applications in the office, forms, order routing, inquiries, complaints, meter reading, collections and credits

No. 68 **February, 1929**

Training Employees in Customer Relations

By C. E. MICHEL

Union Electric Light and Power Company, St. Louis, Missouri

THE importance of having and holding the good-will of the public has long been realized in the public utility industry. Many factors contribute to mold public opinion and the more progressive units of the industry have sought in various ways to conduct their business in a manner which would merit the good-will which is essential to the progress and well being of the industry.

It was only after considerable headway had been made in the program of electrifying homes in the industry, and sales activities were intensified and broadened in an effort to open up new markets and materially increase the per meter consumption of customers, that it was realized customer good-will and confidence had a decided influence upon the success of sales efforts. Unless there is a background of customer good-will and confidence, selling processes become long and tedious ones. Good customer relations has a decided effect upon sales activities as well as upon other phases of our business. Once this fact was realized the directive heads of the light and power industry gave the subject of customer good-will more thought and attention.

What Is Major Influence in Forming Customer's Opinions?

With full knowledge that our company enjoyed an excellent reputation among our customers, who, by the way, held approximately $20,000,000 of our preferred stocks, we decided that there still remained plenty of room for improvement and set out to find the answer to the question, "What is the major influence in forming the customer's opinion of us?"

> Service Suggestions serve their intended purpose only when the ideas and suggestions they carry are put to work. Many companies make it a point to provide all department heads with copies of each issue. Additional copies in leaflet form are available at a nominal price and may be ordered direct from the Chairman.
>
> H. T. EAST, CHAIRMAN
> 1427 Edison Bldg., Chicago

Our study was predicated on the knowledge that we were conducting a large and successful business, were giving good service and were charging therefor at equitable rates. Many subjects bearing on this question were scrutinized and an attempt made to evaluate them. The result was an unanimous conclusion that personal contact with employees stood first on the list. In a paper by Mr. Bernard Mullaney prepared for the American Gas Association we found valuable corroborative evidence of the accuracy of our conclusion.

Mr. Mullaney gave the results of an extensive investigation made by a group of gas companies, to determine what their customers thought of them—and why. Over 15,000 customers were interviewed and asked a series of carefully prepared questions regarding their attitude toward the company. Mr. Mullaney sums up the findings of this investigation in the following paragraph:

> "In this analysis and rating it was found that the impression left by PERSONAL CONTACT WITH EMPLOYEES was twice as strong as all other factors combined in determining the customer's estimate of our service. In other words, the impression left by contact with meter readers, collectors, fitters, telephone clerks, receivers and so on, was twice as important as the promptness, dependability, efficiency and all around physical quality of the service itself."

The Employee Is the Answer

It will be observed that this statement carried with it no qualifications of any kind. It is clear cut and conclusive, based upon facts, not theories. Here is a case where, with millions invested in physical equipment, where large sums had been spent in advertising to solicit the good-will of the public, careful analysis forced the conclusion that the impressions made by employees have had more to do with public opinion of the company than has any other combination or the qualities of the service itself.

It appears that no matter how much advertising we have done, its effect will be forgotten if the employee does not leave a good impression when service is rendered. No matter how fair the rate may be, we will get but little credit if the customer pays his bill to a disagreeable cashier, and no matter how efficiently we perform the innumerable other tasks which bring us into personal contact with our customers, the painstaking work behind that action is lost unless the employee contact is satisfactory to the customer.

If the personality of the employee is so important, then upon what is this personality based? What causes one employee to make a good impression upon the customer and another to make a poor impression? What governs the conduct of the employee as he stands face to face with the customer? If so much depends on this conduct, is it possible to, in any way, control or standardize that conduct?

Human Conduct Based Upon Training

We may start with a truth that is as old as history itself—human conduct is based upon training. No matter how loyal an employee may be, no matter how good his intentions may be—his conduct in the presence of the customer cannot be much better than the training he has received. In fact, he will not even use common courtesy unless someone has taught him what courtesy is and trained him to use it in his every day life.

This analysis brings us to two conclusions:

1. Employee contact with the customer is one of the most important factors in customer relations.
2. Proper training of the employee is the key to the right type of employee conduct.

In the matter of employee relations with the company we had gone far and subsequent events revealed the fact of the time and money expended in that direction. Disloyalty in the ranks was found to be simply not existent, but in the matter of employee training in the handling of the public, we had followed less scientific and effective methods.

True, we had made every effort to employ the right type of people. Department heads were instructing their employees to be courteous and diplomatic, to take a friendly and personal interest in each customer, but the interpretation of these terms was being left largely to the imagination of the employee. In short, the employees were being told to make a good impression upon the customer, but, with few exceptions, they were not being taught how to do it. Some departments were functioning well, others were not. Some individuals were functioning well, while others, in the same department and in all other respects excellent employees, were failing.

Not the Job of Department Heads

We had always considered it the department head's responsibility to give his employees whatever training they needed. But as we became more conscious of the importance of the right kind of employee contact with our customers, we realized that, while we were doing a fair job, it was not up to the standard of our expectations. Furthermore, we came to realize that we could not expect the department heads to get the results we wanted. We had expected them to handle a job entirely outside of their field of training. Our department heads were engineers or business specialists of one kind or another, but not human engineers. They were not instructors and lacked experience in organizing a program of personal training that would give the employees definite methods of meeting and handling the public. Even had they known how to organize the material, they were not experienced in presenting it in a comprehensive way and, in addition, they did not have the time to give the problem the necessary thought and attention.

Here we were with a group of approximately five hundred employees meeting our customers almost daily. It was a well paid, satisfied and loyal group, that we had every reason to believe would rather handle the customer in the right way than in the wrong way, and yet the failure to do that marked the work of an appreciable percent of these employees. We had standardized our service, why couldn't we standardize the employees' method of rendering that service? The conclusion was that this could be done within certain limits, providing organized training was put into effect.

Employee Training Services Investigated

Our first step in that direction was the investigation of several services offered by companies engaged in various systems of employee training. The result was very largely a mass of printed material in the form of poster service or weekly letters to employees, and most of it carried the inherent weaknesses that mark that class of literature. We felt that, while there was merit in some of the plans offered, in general they failed to serve our particular needs, in that they did not apply specifically to our business, and, with few exceptions, made no attempt to define specifically the technique of meeting and handling customers.

Early in 1928 there came to our attention a magazine article entitled, "The Cash Value of Personality in Business." The article was a short, practical and convincing discussion of employee training, as it affected customer relations, and I would like to digress long enough to suggest to anyone interested in this subject that he secure a copy of the *Rotarian* of March, 1928, and read that article.

This article was of major influence in crystallizing our ideas as to exactly what kind of training we wished to provide for our customer contact employees and led to the employment of a firm of business engineers capable of undertaking the task from the standpoints of experience and method and, what is of equal and possibly greater importance, which offered the services of an individual qualified to get the message over. The method of conducting this training and the results achieved, we believe, make this report of general interest to the industry.

Survey of Employee Contact with Public

Since the essential of all training is facts, the first step was to obtain these by means of a survey disclosing how our employees were handling the public. Trained operators, acting as customers, sought these out by personal contact with the employees in every department having contact with customers, and the information so gained became the property of the investigating company. The individual reports bearing the name of the employee interviewed, at no time, were shown to our company, and for the reason that this survey was not made with a view of measuring the relative value of employees, but to furnish the basis for the specific application of the principles of the course to our individual needs. They purchased all kinds of merchandise, from curling irons to electric refrigerators. Acting as consulting engineers in the offices of some of our large industrial accounts, they challenged our salesmen on rates and service. They complained about demand charges to the complaint department; they attacked our billing methods. Orders were given for the connection and disconnection of service. Dozens of inquiries and complaints were made by telephone to test the efficiency of the telephone service. The operators placed themselves in homes and observed the conduct of meter readers and service men. They even went so far, in one case, as to throw water on the kitchen floor and reproach the meter reader for tracking it, in order that they might know how he would handle himself under an unjust criticism of that kind.

Nothing was taken for granted and every effort made to avoid inaccuracies. In certain cases where the data was questioned, the operators went back as many as three times in order to recheck their findings. When the survey was completed, the investigating company had come in actual personal contact with more than two hundred and fifty of the five hundred employees involved, and a written report was made on each of these interviewed. These reports covered the essentials of the employee's conduct during the transaction; in many cases, including the conversation that took place, with the description of facial expression, tone of voice and general attitude. In short, they were intimate personal records of each transaction, made by people who had the customer's viewpoint and were, at the same time, experts in employee psychology.

A Complete Picture of Employee Contact with Customers

With the name of the employee deleted, this survey was laid before us, and from it we got a most complete picture of our organization in its contact with our customers. For the first time we saw our service as it was actually being rendered to the public. There was revealed, of course, the usual instances of customer neglect and, in a few cases, downright inefficiency and rudeness on the part of an employee but, on the whole, actual discourtesy and disloyalty were lacking. The important finding of the survey was a thing far more subtle.

The survey disclosed that, while we were getting by without antagonizing our customers, in far too many cases they were not being treated in a manner that caused them to become friends of the company. That while they had no special reason for complaint, neither did they have much occasion to be enthusiastic about our service. The key note of our organization was mechanical monotony. Over and over the survey reports read, "Too mechanical," "Lack of enthusiasm," "Lack of spirit," and we found that there was lacking that real red blooded interest, that personal touch with the customer which turns a mere customer into a friend. We were allowing our customers to feel the very thing we did not want them to feel—that we were just another large corporation. It is one thing to take care of a customer without creating antagonism; it is quite another to make the transaction so pleasant that the customer will remember it and perchance mention it to a friend at some time in the future and, in our opinion, therein, lies the core of the customer relation problem.

Training Course Decided Upon

The next step was to call a meeting of our department heads to explain to them the details of the survey that had been made, the reason therefor, and to outline the program of voluntary training that would be offered to this group of employees.

There followed a meeting of the department heads and of the special group of our customer contact employees, at which meeting they were told of the survey and of the two hundred and fifty reports that had been made. It was explained to them that these reports were the property of the survey company and were not available to the executives of our company. That the only person in our company who could read the individual reports was the employee upon whom it was written. In this way, the employees were assured that the purpose of the survey was the gathering of information, the result of which would help them in their work, and not to form the basis of individual reports to the company. The employees were invited to see the man we had employed to conduct the course in a private interview at an office assigned to him for that purpose, at which interview the report on the individual would be discussed with him; and the fact that over two hundred and twenty-five employees did actually take advantage of this opportunity is evidence of the interest aroused.

A series of six lectures, in addition to this meeting, was announced, at which the findings of the survey would be disclosed, mistakes cited and suggestions for improvement made. The lectures were to be given in our own auditorium, and were scheduled over a period of three weeks, two evenings a week, two hours to each lecture with a fifteen minute recess. The special contact group of employees and all those in supervisory capacities were invited to attend. Attendance was not made compulsory and the cost of the course was borne by the company.

The Lectures

Briefly outlined, the subject matter of the lectures was as follows:

1. *Business Personality*—In this lecture the various characteristics of personality were discussed. Based upon survey findings the employees were shown their personal characteristics which were creating a negative reaction upon the customers. Other characteristic which would have a favorable reaction were given to them. Many illustrations taken from the survey were cited as examples.

2. *Business Personality*—This lecture was a continuation of the first lecture. In these two lectures the definite factors of business personality were thoroughly analyzed, classified as to their importance and applied to our particular field. The importance of the employee's position was pointed out, in that they were not "just clerks" or "just delivery-men," but individuals with personalities to be exercised in dealing with customers. Survey illustrations were again used to show how each individual is a personal representative of the company and that in so far as the customer is concerned, the employee IS the company.

3. *The Customer's Personality*—Here the characteristics of the average customer were discussed. Methods of handling different types of customers were presented with a view to giving individual service. The employees were shown that customers were not "just customers," but individuals with personalities of their own which must be intelligently considered before the customer could be properly dealt with.

4. *Self Organization*—This lecture took up the employee's daily habits on the job, enforced with specific illustrations and data from the survey reports. They were shown how their fundamental habits of thought governed their performance—that they could not successfully handle customers unless they could first successfully handle themselves. That they could not control their conduct in the presence of customers unless they were able to control their own moods. Simple yet effective methods for improvement were suggested.

5. *What is Salesmanship*—The first purpose of this lecture was to remove the false ideas many have on so-called scientific salesmanship. They were shown that the foundation of all salesmanship is to interpret intelligently the customer's need and fit the company's service to that need. The failure to do this was emphasized as one of the outstanding weaknesses found during the survey. Methods of applying this type of selling in the utility business were given them.

6. *Personal Progress*—The last lecture was an appeal to the employee's self interest. They were brought face to face with their future and made to realize that their positions five years ahead depended upon the efforts they were making now to better themselves at their jobs. A program for broadening their education and preparing themselves for better jobs and greater responsibility and success was outlined in a daily program of study. Responsibility to families was also stressed.

At the end of each lecture a printed outline thereof was handed those attending. The outlines were intentionally brief so there would not be enough reading matter to discourage frequent reviews.

The Charts

During the course of the lectures each employee was given ten copies of a printed chart upon which the factors of personality affecting customer relations were listed. They were asked to pass out nine of these charts to different people, such as fellow workers, friends, customers and wives. These people gave the employee a detailed grading on the various factors of his personality, based upon his daily conduct, and returned the card by mail, unsigned. He graded himself on one copy so that he could compare his opinion of himself with that held by others.

After the charts were graded and returned to the employee, they gave him a picture of himself in black and white. His weaknesses stood out like sore thumbs, showing him that the criticism and instruction received during the lectures, applied to him and not to the fellow sitting next to him.

This outline may sound pedagogical, but the reverse is true. Our employees not only learned what mistakes they were making, but also learned how to correct them. They received detailed and implicit instructions in handling customers. Concrete examples were acted out on the platform, illustrating facial expressions, tone of voice, personal attitude and many other factors which enter into the art of making friends of customers. Detailed methods of answering questions were likewise given.

The lectures were given in plain understandable language and were made entertaining at the same time through the use of humorous comments on various departments, so that the audience was always in a cheerful and receptive frame of mind.

It would be difficult to conceive of any effort along educational lines being more enthusiastically received than were these lectures. While they were in progress they were the chief topic of conversation throughout the organization, and probably the best evidence of the interest taken is the attendance record, which is given here.

Attendance Record at Lectures

Lecture Number	** Total Attendance*	*Attendance in % of Number Invited*
1	467	89
2	496	95
3	464	88
4	469	89
5	482	92
6	** 446	85
7	465	89
Total	3,289	—
Average	470	90

*Excludes the attendance of special groups at certain lectures.

**One of the worst thunderstorms of the season started about one-half hour before the time set for this lecture.

As the attendance was voluntary, the significance of this record is apparent. It is worth noting that the attendance at the last lecture was about equal to the average for the entire series, and that the average throughout was 90 per cent of those eligible. This in spite of the fact that the lectures were given during the month of June when vacations were in progress and when the weather was unfavorable.

In addition to the above figures a number of employees not originally invited asked permission to attend, after hearing reports from those present. To the extent of available space, they were accommodated, and among these were a surprising number of linemen, groundmen and men from the plants, employees who seldom contact with the public.

Private Interviews

Paralleling the lectures, the lecturer held private interviews with employees who requested them. Reports taken during the survey were analyzed, weaknesses pointed out, individual problems discussed and employees were given definite methods of overcoming their difficulties with customers. The value of these interviews cannot be overestimated.

Special Meetings

In two special meetings—one for department heads and one for division heads—and without using any names, the employee's side of the story was then presented to our executives and to the staff. In these meetings the department heads and division heads were given a picture of themselves as their employees saw them. The psychology of the employee was analyzed, the causes for misunderstandings developed and the methods of avoiding these set forth.

At these meetings a simple chart was handed out, on which to make a periodic check on the performance of employees. The chart was arranged to reveal weaknesses as they developed, so that intelligent assistance could be given the employee in overcoming them.

General

We have given a rough sketch of the work that was done in an effort to train our people to a higher standard of customer relations. Since this work included varied activities, a brief summary may be of assistance in grasping the plan in its entirety.

1. By means of the survey we found out how our employees were handling our customers.
2. Through the lectures we analyzed our mistakes and supplied methods of correcting them. We gave our employees a definite technique in handling customers.
3. Through the use of individual analysis charts we uncovered the weaknesses of each individual and showed him how to correct them.
4. Through private consultations we individualized the training. Through these interviews we also found out what our employees thought of us and uncovered conditions that were detrimental to the morale of our organization.
5. We gave our department and division heads a definite method of checking the performance of their employees on matters that had been covered in the course, as well as a plan to correct weaknesses.
6. We brought to our employees a realization that individual efficiency, energy and loyalty, while valuable to their company, was of greater value to themselves as the foundation on which their own futures must be built.

The question as to what this work has accomplished logically follows. Obviously it would be impossible to say just how far reaching this program has been. Like advertising, the results cannot be reduced to mathematical terms. However, we have had definite proof that the work has borne fruit.

We have seen improvement in dozens of individuals, so marked that they were noticed generally. The influence of the work has spread throughout entire departments. Our methods of handling customers over the telephone has been improved to a remarkable extent. The morale and esprit de corps has been improved, and unquestionably our employees are more "customer minded," and are putting more spirit and enthusiasm in their customer contacts.

The effect of this attitude is shown in the reaction of our customers. With surprising frequency they have voluntarily reported instances of unusual courtesy shown them by our employees. We are actually making friends of our customers.

This does not mean that our customer relations problem is completely solved, but we have at least laid a solid foundation upon which to build. We have learned that it is good economy at any cost to give this training to the employees responsible for our reputation.

The cost is not great. The total cost of training each employee under the

(Continued on page 109)

A Word About the Building

To House the 52nd CONVENTION and EXHIBITION

THE great new convention hall at Atlantic City where the 52nd convention and electrical exhibition of the National Electric Light Association will be held in June, 1929, is said to be the largest and most complete auditorium of its kind in the world. Work on its construction is still being rushed so that the auditorium will be available soon after the first of the year.

It has been estimated that the entire building will cost at least $12,000,000. It is located on the boardwalk, facing directly on the ocean, and occupies an entire city square, being 350 ft. in width and 650 ft. deep. It is within three squares of the Reading Railroad terminal and within convenient distance of the larger hotels. Trains of the Reading and Pennsylvania railroads can be operated to the ground floor entrance. There is parking space within the building for 400 automobiles.

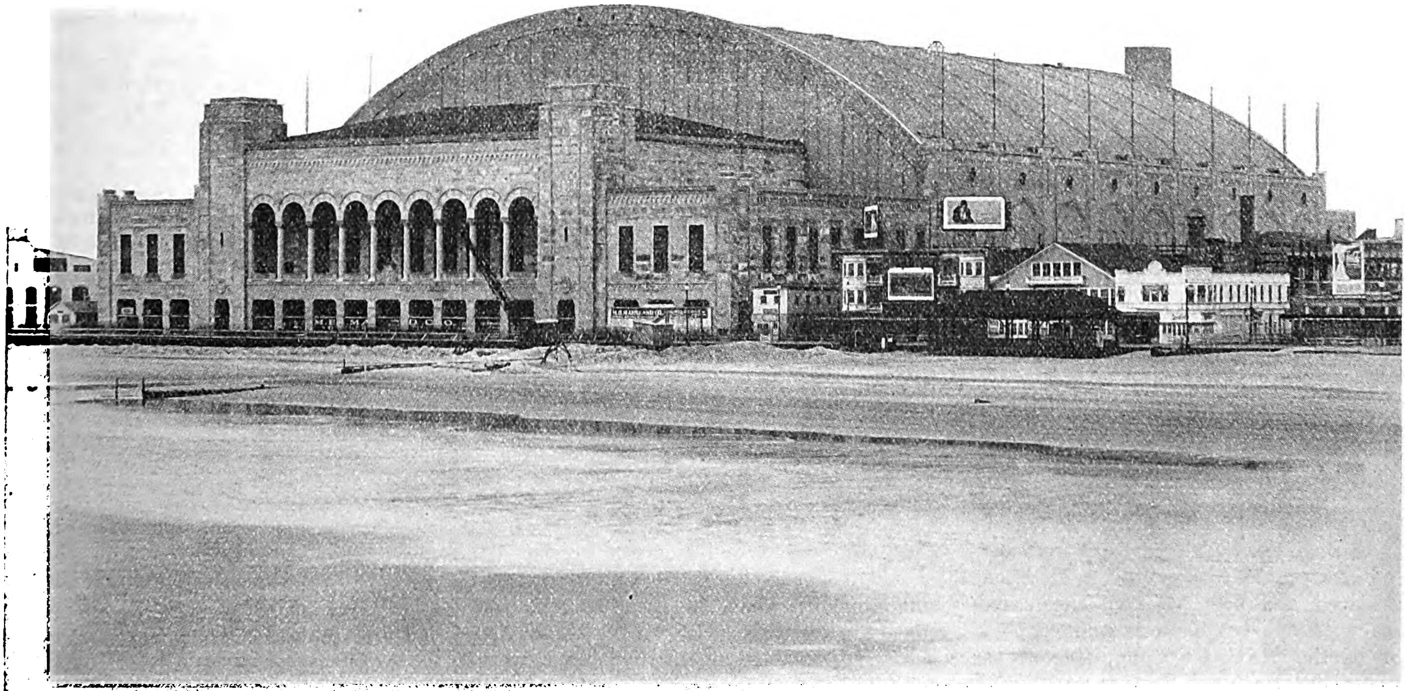
Thirty-three thousand people can be seated in the main auditorium. The ballroom, located on the boardwalk front of the building, can seat 3500 more, while there are accommodations for additional thousands in the numerous smaller meeting and committee rooms. Despite its enormous size, the acoustic properties of the main auditorium are so excellent that without being raised above an ordinary pitch, the human voice can be heard from one end of the great room to the other. There will be approximately 95,000 sq. ft. of exhibition space in the main auditorium.

The roof of the great auditorium is suspended by great trusses with a span of 350 ft. and a maximum height above the floor of 130 ft. There are no columns to break the view, and the balconies, which project out 22 ft. from the side walls, are 15 ft. above the floor. A series of rooms on the balcony level are available for auxiliary exhibits or for committee or meeting rooms. The great ballroom, which is located at the balcony level across the seaward end of the building, is expected to be one of the most magnificent public rooms in the country. It is to be superbly decorated, and will open out onto a loggia overlooking the boardwalk, the plaza and the ocean.

Other features of the building include the largest stage in the world, two great bath houses, the world's biggest pipe organ, freight and passenger elevators, a complete heating and ventilating system, and everything that modern science can provide for the comfort and convenience of exhibitors and visitors.

As this issue of the N. E. L. A. Bulletin goes to press approximately as many applications for space in the Exhibition have been received as there were exhibitors at last year's electrical show. Even though there is more room available in this new auditorium, about thirteen per cent more available space than last year, there is every indication that the late applications for room will form a waiting list such has occurred at most of the exhibitions sponsored by the N. E. L. A. at its annual conventions.

More elaborate preparations are being made for the handling of general and section meetings than have prevailed in former years. The committees that have these arrangements in charge are confident that the programs will allow for more efficient handling and seating of the various groups and that the tentative programs and lists of speakers will be more of a drawing card for the entire industry.



FACTS and FIGURES

National Statistics of the Electric Light & Power Industry

SOME 380 companies are now returning regularly to the National Electric Light Association a monthly report of their operating data. These companies represent about 80 per cent of the electric light and power industry. The monthly returns from these 380 companies have been summarized and extended to cover 100 per cent of the entire business.

The form in which these data are presented has been drafted in accordance with the suggestions and cooperation of the Statistics Committee of the Accounting National Section.

The cordial cooperation of the reporting companies has made possible the inauguration of monthly statistical data for the electric light and power industry by the N. E. L. A.

The timeliness of this current statistical information constitutes the essence of its value to the industry and to the public which it serves. In order that the electric light and power industry may obtain the full benefits of this service, it is again urged upon all the reporting companies to expedite their returns so that the reports will be received at N. E. L. A. Headquarters within thirty days and the present lag of three months may progressively be cut down.

GEOGRAPHIC DIVISIONS and STATE ASSOCIATIONS

Empire State Association Meeting

THE electric section of the Empire State Gas and Electric Association met in New York City Jan. 10-11 with more than a hundred delegates from the State in attendance.

M. S. Sloan of the New York City companies discussed the benefits of section meetings.

Following his address a report upon automatic frequency control was read by G. A. Powell, chairman of the operating committee. H. E. Warren, president Warren Telechron Company, described the application of the telechron motor with master pendulum timer for the control of frequency, saying that with it an accuracy within one second per day was common and that it was possible to get an accuracy of one second in ten days. Such accuracies when used in conjunction with the frequency meters which have an accuracy of one-fiftieth of a cycle give virtually a constant frequency. Aerial power cables were discussed in the report of the overhead systems committee (J. F. Werner chairman). Colonel Stedman Hanks, president American Airport Corporation, spoke on the need of electrical power for airport lighting, beacon lighting and warning lights.

A report on vibration of overhead conductors, presented by the transmission lines committee (S. H. Abbey chairman), was the first item in the afternoon session. The radio co-ordination committee (W. L. Wenzel chairman) reported on the generation of radio interference, explaining clearly the causes of many radio disturbances. The discussion ranged around local difficulties, most of which had been corrected, and there was agreement that only about 17 per cent of all complaints investigated can be charged to electric utility companies' systems.

F. G. Schramm, chairman underground systems committee, reported on applications of parkway cable, stressing the fact that laying of cable unprotected by duct lines may cause trouble through workmen breaking these lines or the cable. Such interruptions are difficult to locate, he said, particularly in the case of parkway cable used for street lighting.

The report of the hydraulic power committee (Byron E. White chairman), presented on the second day, covered the relation of rainfall to run-off. It was well prepared, as were the reports of the apparatus and rural lines committees. The paper on rural lines construction, by A. W. Underhill, showed fruitful results from many hours' research.

In an able address Charles S. Ruffner, president of the association, stressed the good to be obtained from a free interchange of ideas.

V. J. F. Brain, New York Edison Company, was elected chairman of the managing committee for the ensuing year and S. H. Abbey, Northern New York Utilities, Inc., vice-chairman.

Rocky Mountain Division Committee Conference

By O. A. WELLER

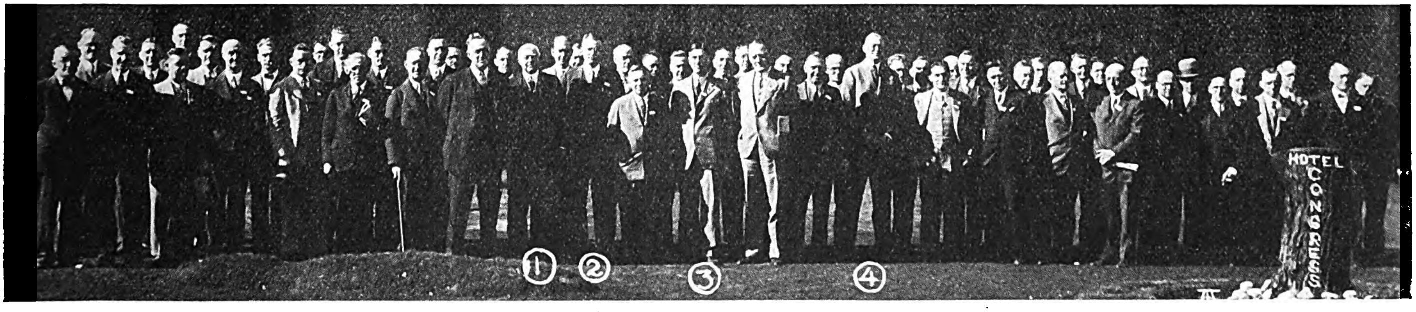
ASSOCIATION committees organized within the Rocky Mountain Division covering the states of Colorado, Wyoming and New Mexico met at the Congress Hotel, Pueblo, Colo., on January 25 and 26 for their annual discussion of utility problems. The scheme of these meetings is to have all committees represented as far as possible and to discuss the principal problems that have been presented to the various sections and committees. Eighty-five company managers, executives, engineers, accountants, commercial men and others were in attendance.

For the second time our program was set up as a series of questions. Thus under each established line of committee research two or three points were listed on the program not as statements but as questions. This listing of questions serves the dual purpose of providing specific points for profitable discussion and also of causing those present to think of other phases of their work which they desire to secure information upon. The question method of drafting programs has been well justified and very largely used by a number of national associations, particularly the American Management Association.

Growing out of this Committee Conference were a number of concrete suggestions and recommendations. Many of these had to do with commercial installations of load building equipment. Several of our larger companies have standardized on their methods of wiring for electric ranges, arriving at a cost of $27.50 for such installations. Subjects which received much attention were the best methods of placing utility securities, use of the NELA Handbook. present legislative problems both local and national, features of design of the proposed Boulder Dam Hydro Plant, methods of creating a commercial consciousness in the minds of engineers, accountants and other employees to the end that the company's load may be increased.

The value of these general discussion meetings is becoming more and more apparent where chief executives, accountants and engineers contribute from their own experiences for the benefit of others. An enjoyable evening was spent in an inspection trip through the steel mills of the Colorado Fuel and Iron Company in West Pueblo. At this plant a $10,000,000 electrical installation of prime movers, individual drive motors and controls has recently been completed.

The closing feature of this Conference was a social event in the form of a dinner-dance at the Pueblo Golf Club with the Southern Colorado Power Company and the Pueblo Gas and Fuel Company as hosts.



Officers and Members Rocky Mountain Utility Associations

1. C. N. Stannard, Public Service Co. of Colo., Denver; President, Rocky Mountain Division.
2. W. D. Johnston, Mountain States Power Co., Casper, Wyoming; President-Elect Rocky Mountain Division.
3. O. A. Weller, Public Service Co. of Colo., Denver; Secretary, Rocky Mountain Division and Secretary Colorado Utilities Association.
4. V. L. Board, Public Service Co. of Colo., Denver; President-Elect, Colorado Utilities Association.

Kentucky Association Convention

THREE hundred delegates represented the 46 member companies of the Kentucky Association of Public Utilities at its twelfth annual meeting at Louisville, January 15 and 16, and 426 gathered at the banquet on Jan. 15. The program as carried through ranged around general utility topics, embracing the different classes of companies, but electricity on the farm was the outstanding subject of discussion.

In his presidential address Samuel Riddle described the work of a committee appointed under a resolution of the 1928 Legislature to make a survey of the utilities of the state and suggest remedial legislation if needed. A meeting of this committee was held in November at Louisville, attended by utility representatives, who offered full cooperation and are now compiling information for the use of the committee. A news service bulletin for the use of the press was abandoned early last year, Mr. Riddle said, and Robert Montgomery of the Louisville Gas & Electric Company was made chairman of a special committee to give out publicity.

On Tuesday afternoon Keen Johnson, editor of the Richmond (Ky.) *Register*, spoke on "The Industrial Future of Kentucky," telling of scientific developments aided by electricity. Dean Thomas P. Cooper, of the Agricultural College, University of Kentucky, discussed "What Electricity Means to the Farmer," and G. M. Miller, Louisville Gas & Electric Company, took as his subject "Neon Lighting."

J. F. Owens, vice-president of the National Electric Light Association, was guest of honor at the banquet and spoke on public relations. James P. Barnes, Louisville Railway Company, was toastmaster.

On Wednesday morning N. M. Argabrite, vice-president American Gas & Electric Company, New York, read a paper on "A Fundamental Rate Basis." Prof. Ralph E. Hill, University of Louisville, spoke on education and higher standards of living as developers of the public utilities.

James B. Davis, president Federal Land Bank, Louisville, discussed "Progressive Agriculture with the Aid of the Utilities"; J. H. Harmon, Kentucky Utilities Company, stressed the influence of safety work on industry, and Mrs. B. K. Yewell, chairman of the women's committee, spoke on "Selling the Electric Idea to Women."

Officers elected are: President, W. H. Horton, general manager Cincinnati, Newport & Covington Railway Company; first vice-president, L. B. Herrington, president Kentucky Utilities Company, Louisville; second vice-president, M. C. Funk, Kentucky & West Virginia Power Company, Ashland, Ky.; secretary, E. F. Kelley.

Tom C. Polk New Secretary-Treasurer, Great Lakes Division

TOM C. POLK, who recently was elected secretary and treasurer of the Great Lakes Division, National Electric Light Association, took office on Feb. 1. He succeeds the late R. V. Prather. His headquarters are in Chicago.

Mr. Polk has been director of public relations of the Central Indiana Power group the last five years. The group serves 170 communities in Indiana.

He is serving his second term as president of the Indianapolis Lions Club and is a deputy governor of the Indiana Lions group. He is a director of the Indianapolis convention bureau and the American Peace Society, Indiana Committee. He also is a member of the Indianapolis Athletic Club and the Columbia Club.

SPECIAL COMMITTEES

Increased Voltage at the Point of Utilization*

SOMEONE evidently impressed with traffic congestion has remarked that the invention of the bumper was the one thing that made automobile travel possible. In like vein one might say that the invention of the multiple-outlet receptacle is the one thing that makes possible the use of much modern electrical equipment.

For many years building wiring has been notoriously inadequate with respect to provisions for future growth. Usually it has been inadequate even to the immediate requirements both as to amount of copper and number of outlets. The demand for more and better lighting and the increasing use of electrical appliances have imposed demands for additional outlets and have increased the load to an extent which frequently occasions serious potential drop between service entrances and outlets.

Not infrequently amateurly installed wiring, sometimes constructed from Five-and-Ten-Cent-Store parts, carries the current to remote corners of inadequately wired rooms. Festooned artfully around the walls or ceilings, or concealed craftily back of davenports, pianos, file cabinets, and under rugs, the extension cord brings the current to any spot desired. It usually compels some of the original outlets to do the work which should be done by two or three outlets. Whatever may be said of the desirability of such extensions of a wiring system there is no question that in many installations such extensions have added materially to the load, rendering wiring which originally was meager now quite inadequate to meet modern requirements. Even where no additional wiring has been added the tendency with passing years is to use more and larger lamps and to add motor-driven and heating appliances which over-tax the wiring system.

There are three principal consequences of these conditions which are unsatisfactory. First, there is a persistent loss of energy in the inadequate wiring. This can be corrected only by the use of more copper in the installation. Second, when large lamps or motors or heating devices are placed in circuit or removed from circuit, there is likely to be an annoying flicker of lamps as a result of change in the potential drop. Here again, correction must be sought by adding copper to the wiring system. Third, the potential drop often brings the voltage at the lamps or appliances to a point below that for which they were intended with resultant loss of effectiveness in the translating device.

Surveys in buildings constructed five or ten years ago have shown that the voltage drop in interior wiring, measured from the service switch to the actual point of use at the lamp terminals, is likely to run to two or three times the value originally assumed. The lighting service especially suffers in such cases because incandescent lamps are particularly sensitive to voltage variations.

Under such conditions, it seems practicable to improve conditions somewhat by increasing the voltage maintained at service entrances to an amount which may be indicated by the facts regarding socket voltages or ascertained during principal hours of use. If, upon adequate survey of socket voltages during hours of use, it be found that lamps are operated at say 112 volts during periods of greatest use when they should be operated at 115 volts, it would seem to be a fair question whether it would not be desirable to increase the potential at the service entrance in order to operate the lamps more nearly at their normal voltage. In such a case the illumination would be increased by about 8 per cent and the watts consumed would be increased by a little over 4 per cent.

In the last analysis it is the voltage actually delivered at the point of utilization that is really important to the service. If lamps and appliances are designed to operate at 115 volts they will render their best service when that voltage is applied.

The moral of this brief article is that if best results are to be sought it is important to know the facts concerning socket voltages in principal hours of use and to be guided by those facts in regulating voltages on distribution circuits for most effective service.

---

Great Lakes Commercial Section Meeting

THE Commercial Section of the Great Lakes Division held its second meeting for the fiscal year 1928-29 at the Pfister Hotel in Milwaukee on Friday, Jan. 25. The meeting was very well attended, with a total attendance of 85.

At 9.30 in the morning all committees gathered together for reports and general discussion. This was followed at 10.30 by meetings of the individual committees.

The work of this division is proceeding very smoothly and the activities of the various committees for this year are most worthwhile.

Frank A. Coffin, sales manager of the Milwaukee Electric Railway & Light Company, addressed the gathering, following the luncheon, discussing the commercial activities of his company.

C. E. Greenwood, Commercial Director, N. E. L. A., attended the meeting and told of the work that headquarters is doing in connection with commercial matters. Mr. Greenwood also gave considerable assistance in connection with a proposed merchandise sales conference which, it is anticipated the Great Lakes Division will sponsor this spring.

The next meeting will be held in Detroit, Friday, April 5.

W. H. Sammis.

Promotion of Domestic Cooking Load

Previous to the Annual Convention of 1928, the Electric Range Committee produced a complete advertising and sales plan for promotion of the domestic cooking load.

The advertising broadsides were the products of the Manz Corporation, Chicago, and were prepared by the Range Committees of N. E. L. A. and N. E. M. A., through the Society for Electrical Development.

There has been a general reduction in the price of the advertising material contained in "The Plan to Sell Electric Cookery."

The average reduction in price is about 30 per cent, and it is anticipated that this will stimulate a much greater demand for these excellent mailing pieces.

Write for more information on special prices to C. E. Greenwood, Commercial Director, N. E. L. A., 420 Lexington Ave., New York, N. Y., or to the Society for Electrical Development, 420 Lexington Ave., New York, N. Y.

Make preparations now for the Spring drive on electric ranges.

Pennsylvania Electric Association Begins New Commercial Publication

VOLUME 1, Number 1 of *The KWH Merchant*, dated Jan. 1, 1929, has been mailed to the members of the Pennsylvania Electric Association. This is the first issue of the new monthly magazine sponsored by the Commercial Section of that association.

Attractively arranged and printed in eight pages, it is designed as a medium for the interchange of ideas, suggestions and plans relating to better load-building methods and other commercial phases of the utility business.

R. R. Electrification

Progress of Railroad Electrification During 1928

IN a review of the year 1928 in the electric railway field, W. D. Bearce of the railway engineering department, General Electric Company, says that the most important steam railroad electrification initiated was the Cleveland Union Terminals project, plans for which had been under way for several years. This electrification involves 17 route miles and will employ 3000-volt direct current with overhead catenary supply. There are now under construction at the Erie works of the General Electric Company for handling passenger trains of the New York Central and other roads in and out of this terminal 25 204-ton passenger locomotives, rated at approximately 3000 hp.

The completed electrification of the Boston, Revere Beach & Lynn narrow-gage railroad is also described.

Both locomotives and car equipment have been installed on the Pennsylvania Railroad. This equipment includes motors and control for four 200-ton locomotives built by the railroad company for operation at the New York Terminal and 30 single-phase motorcar equipments for the new Wilmington and Westchester divisions.

Delivery has been made during the year of additional passenger locomotives to the Paulista Railway in Brazil, bringing the total number of the heavy 150-ton type up to five units and the total number of all General Electric locomotives to 26 units. Two 260-ton locomotives similar to those installed last year have been placed in service by the Great Northern Railway on the electric zone through the Cascades, in Washington State. Operation through the new 7¾-mile Cascade tunnel began on Dec. 28. Two 150-ton, 3000-volt direct-current locomotives are under construction for the Mexican Railway.

Training Employees

(*Continued from page* 104)

program was about one-half of one per cent of the employee's yearly salary; and if it is worth paying to keep an employee on the job, surely that sum is worth spending to insure his doing the right kind of a job.

We have invested millions in physical equipment. In the aggregate we have spent millions in advertising and in good-will gestures of one kind or another. We have boasted of the high caliber of our service and its low cost. Then a customer walks through our front door to be served. He meets an employee, loyal but untrained, and in the course of that loosely handled interview something happens that displeases him—forthwith he ignores the rate reductions we have brought about, the advertising we have done to inform him of plans for future reductions and improved service, the millions we have invested to serve him, and when he walks out the front door takes with him an opinion of our company and its service based squarely upon the personality of the employee that served him. Surely that employee is worthy of careful training.

CORRESPONDENCE

To the Editor:

The Pennsylvania Railroad is to be complimented on their announcement that they were going to purchase power.

The great public utility companies have spent millions on research and evolution of the great so-called superpower stations, and through their resources, can produce power cheaper than any other set of men in the world.

Railroads building their own large power stations more or less go into competition with the public utility interests, as happened in Boston a great many years ago when the Boston Elevated built a power station within a thousand or two thousand feet of the Boston Edison Station, which really amounts to an economic loss.

Therefore, I state in as clear English as possible, that the railroads of America, in electrifying, should first, last and all the while, buy their power of the great public utilities.

It is also known by all thinking men that the public utility companies are quoting prices commensurate with the purchase of power, and last of all, but not least, the diversity of the load on a public utility as compared with the load factor of a railroad, also gives a great additional gain.

John A. Stevens.

Lowell, Mass.

WOMEN'S COMMITTEE

Miss Sophia Malicki, *Chairman* Miss Isabell Davie, *Secretary*

News Letter

By Mrs. Thelma Van Ness

Two short courses of interest to women in the electrical industry, sponsored by women's committees of the N.E.L.A., will be offered in March.

The Women's Committee, Southwestern Geographic Division, will for the second time sponsor a Short Course in Electrical Household Equipment at the Oklahoma A. & M. College, Stillwater, Okla. It will be held March 18-23 inclusive. Additional information will be sent upon request to Miss Florence Shertz, Home Economics Department, Oklahoma A. & M. College, Stillwater, Okla., or Miss Julie Pailet, New Orleans Public Service Co., New Orleans, La., who is chairman, Women's Committee, Southwestern Geographic Division.

A short course for women interested in the electrical and gas industries will be conducted under the auspices of the School of Home Economics at Purdue University, Lafayette, Ind., the week of March 24. Additional information concerning the program can be secured from the school or from the Indiana Public Utilities Association, 1548 Consolidated Building, Indianapolis, Ind.

* * *

The fall course in Home Lighting, which the National Lamp Works offers through the Nela School of Lighting, was held Nov. 12-17 last.

For the first time in the four years that Home Lighting courses have been held, there were registered an unusually large number of men. As the program had been planned especially to prepare women for the residential lighting field, the presence of so many men was a little disconcerting. However, it worked out better than was first anticipated, for several of the men who attended were heads of lighting departments which are about to take on women to cover the residential field.

There were thirty-four registrants; eighteen women and sixteen men.

In planning the program, a great deal of thought was given to insure that it should contain not only the fundamental principles of residential lighting, but also as many practical suggestions as possible for future activities.

In order that this material should be of maximum value, founded on experience, a number of women who are outstanding in their work in this field were invited to be on the program. These were: Miss Marie Tudor, Home Service Director, Interstate Public Service Co., Indianapolis, Ind.; Mrs. Frances Rosenberg, Home Lighting Engineer, Commonwealth Edison Co., Chicago, Ill.; Mrs. Ella Smethers, Director of Home Service, Ohio Public Service Co., Cleveland, and Miss Isabell Davie, Secretary, Women's Committee, N.E.L.A. Rounding out and tying in the whole week's endeavor came the address on "Women's Influence in the Residential Field" by Mrs. Bernice Bowser, editor of the central station residential magazine, *Beauty at Home*.

One very outstanding feature of the week was an evening spent at the new home of Dr. and Mrs. Luckiesh, which is of especial interest to lighting students because of the lovely lighting effects. The house, which has ten rooms, has 177 sockets which carry 6500 watts.

* * *

The October and November meetings of the East Texas Women's Committee of the Southwestern Gas & Electric Co. were held in the lobby of the Marshall office. The luncheon for each meeting was prepared by the members of the committee in electric cookers.

To these meetings a number of outside guests were invited: club women, newspaper men and women, and people of prominence in local civic affairs. Several department heads from the company were also guests. The general subjects of the meetings were "Public Contact" and "Public Utility Economics."

* * *

Miss Alice Schuetze, Chairman, Women's Committee, Central Power & Light Co., was invited by the Agricultural and Mechanical College of Texas to take part in its Farmers' Short Course. She gave five lectures on lighting the farm home and also assisted in other classes. Books on the making of lamp shades were distributed.

Miss Schuetze was asked to give lectures in future courses.

Home demonstration agents, who have important parts in the farm short courses, expressed the need for assistance of utilities in these programs and in their general educational work with farm women.

* * *

The final results of the lamp campaign carried on by the Southern Illinois group of the Illinois Power & Light Corp., East St. Louis, Ill., show that 150 girls sold 102.39 per cent of their quota, or 25,143 lamps—value $6,074.12, wattage, 1,431,475. Miss Angie L. Watts—what an appropriate name!—is chairman of the Women's Committee in Illinois, and her charts, posters, etc., were very effective in sustaining enthusiasm throughout this campaign.

* * *

Miss Julie Pailet, chairman of the Southwestern Division Women's Committee, tells us about an Efficiency Contest in which each Women's Committee reports its activities for the month, each different piece of work, including meetings, stock sales, talks, etc., counting a certain number of points. This contest is in effect from October, 1928, to March, 1929.

* * *

In the Mazda Lamp campaign of the Jackson District, Consumers Power Co., Michigan, one of the Women's Committee girls, Miss Marjorie M. Wiltse, carried off first honors. According to the *Office Illuminator*, this group is in the midst of a playlet writing contest.

* * *

The Women's Committee of the Northwestern Electric Co. at Portland, Ore., originated, and until a few months ago edited, a company publication known as *Northwestern Light*, at which time an editor was appointed to relieve the girls.

* * *

Through the efforts of Mrs. A. W. Angell, Chairman of the Women's Committee of the Northwestern Electric Co., Portland, Ore., a luncheon was prepared and served to a group of ninety-six women by the range demonstrator of that company. A Parent-Teacher group of over two hundred was similarly served and after each of these luncheons a demonstration of the electric range used was given.

* * *

At a recent meeting in Tennessee, the girls of the Tennessee Electric Power Co. were given questionnaires consisting of 14 questions pertaining to operating costs of various appliances, home lighting, etc., and a prize was offered to the girls answering the largest number of questions correctly. Mrs. C. E. Gross was the winner.

* * *

One of our Women's Committee girls, Ruth E. Creveling, is the editor of *News-Meter*, the San Diego, Cal., Consolidated Gas & Electric Co. magazine, a very interesting medium for showing the activities of the San Diego organization.

* * *

On October 30, the local chairmen and representatives of Ohio Women's Committees met with Mrs. Ella Smethers, Ohio Chairman, and Miss Esther Rockey in Mansfield, Ohio, and went over the work for the coming year. In the afternoon Miss Alice McCarren, acting as hostess for the Westinghouse Electric & Manufacturing Co., conducted the women present through the Mansfield plant of that company. At the end of the trip, the girls enjoyed an interesting demonstration of the "Televox" or "Electric Maid."

* * *

The Central Illinois Public Service Co. reports 35 demonstrations of electric cookery made by company women in different towns throughout the territory during two months to 832 women.

* * *

A two month's report from the Great Lakes Division shows that 98 addresses were made to outside groups by girls of the Central Illinois Public Service Co. to a grand total of 6209 persons.

* * *

The Girls' Safety Team of the Wisconsin Public Service Co. has appeared before several outside organizations.

* * *

The Women's Committee of the Rochester Gas & Electric Corp., New York, holds two meetings a month. One-half of the personnel attends one and the other half are present at the duplicate meeting.

* * *

The Kansas Gas & Electric Co., Pittsburg, Kan., district Women's Committee and a few employees' wives are receiving instruction in First Aid and Safety First Work from William Hislop, Superintendent of the Mine Rescue Station, at the Kansas State Teachers College. The class meets every Tuesday and Friday evening for four weeks. Their aim is for 100 per cent of their committee to pass a satisfactory test on the Prone Pressure Method of Resuscitation and First Aid Emergency methods and thereby receive a diploma. In Topeka more than a fourth of the girls—divided into four teams—are running a race to see who can learn "Safety First—and Best." A prize will be given the winner.

* * *

According to *Woco Sayso*, published by the Women's Committee of the Denver District, Public Service Co. of Colorado, these girls have decided to divide their group into nine smaller groups, one for each of the nine meetings of the year. These Squads, as they are called, are numbered by chance and then drawn for date of officiating.

* * *

Miss Florence Donkin, Canadian Geographic Division Chairman, reports that the Women's Committee at Montreal holds monthly luncheon meetings with an attendance of approximately 170 girls.

* * *

Miss Margaret Kingsley, assistant to Dr. Mary E. Pennington of the Household Refrigeration Bureau, New York, spoke before the Springfield, Ill., Women's Club recently on Home Refrigeration. Miss Kingsley's appearance was arranged by the Central Illinois Public Service Co., Springfield. Preceding the meeting she was guest of honor at a luncheon given by women employees of the company.

* * *

Announcement is made of the appointment of Miss Iva B. Sellers, Pennsylvania Electric Co., Johnstown, Pa., as a member of the National Women's Committee. Miss Sellers succeeds Miss Clara Zillessen, Philadelphia Electric Co., Philadelphia, Pa., resigned, who has held the Eastern Division Chairmanship for a number of years.

* * *

"Cooking with small electrical appliances," is the seventh of the "More Power to the Home!" series of booklets presenting the uses of electricity in the home, prepared by the Women's Committee, is available for distribution. Price, 1-9 copies, each 13c.; 10 or more copies, each 12c. Orders should be sent direct to National Electric Light Association, 420 Lexington Avenue, New York.—(*advt.*)

MAGAZINE ARTICLES

Below is a list of articles which appeared in various magazines recently that are especially interesting to Women's Committee members:

- *Good Housekeeping*—January.
  - Testing at the New Institute —George W. Alder.
  - Christmas Gift Insurance—B. Lawson Miller.
- *McCall's Magazine*—January.
  - Wash Days Are Easy Days—Anne Pierce.
  - Laundering Delicate Fabrics.
- *Woman's Home Companion*—January.
  - Kitchenettes in Action—Alice Bradley.
- *People's Home Journal*—January.
  - Better Homes in America—Irene H. Burnham.
- *Modern Priscilla*—January.
  - The January News Letter—Della T. Lutes.
  - Convenience and Beauty in the Kitchen—Greta Gray.
- *Better Homes and Gardens*—January.
  - Modern Lamps Lose Bows and Furbelows—Athena Robbins.
- *The Farmer's Wife*—January.
  - Beating Ma Out of a Job—Richard A. Perry.
- *Capper's Farmer*—January.
  - Electric Refrigeration Ended Deer's Trips to Town for Ice—S. M. Ballard.

RELATED and other ORGANIZATIONS

Mid-Winter Conference of Electrical Leagues

In the Mid-Winter Conference of electrical leagues, held in Cleveland Jan. 7-9, under the joint auspices of The Society for Electrical Development and the League Council, there was a new note of definiteness about the several goals of cooperative effort with which league managers are concerned in their continuous task of aligning and keeping aligned the local purposes of a many-sided industry. This definitive character of the congress was all the more impressive in view of the fact that the sessions brought out a record enrollment of 101 conferees representing 39 leagues and central stations, manufacturers, jobbers, contractors and the business press.

First, in getting a focus on league policy with respect to its character as a local industry spokesman, there was developed a definite attitude that the old axiom of "Live and let live" should be altered to read: "Live and *help* live!" This sentiment was crystallized by extended discussion of the credit and selling problems apropos of the small contractor-dealer.

Secondly, and also with respect to policy, there was an unrecorded consensus among the conferees that in league organization there must be the conception among the membership that "cooperation is doing something with some one else that you yourself may not want to do," this epigram being the invention of G. E. Miller, sales manager of the Cleveland Electric Illuminating Company, who made the address of welcome.

Thirdly, and in connection with the two foregoing principles of league organization, there must be a definite plan of local education in the matter of good trade practice as the cornerstone of every league structure. It was emphasized that without an appreciation of this fundamental element of the machine on the part of the membership, that cooperative efforts marketwise would meet with only indifferent reception and spasmodic success.

The high spot of the conference was the formal presentation of the Franklin Red Seal Plan made to the secretary-managers during their visit to Nela Park.

In his introductory remarks, Ward Harrison, chief illuminating engineer of Nela Park, pointed out that the specifications represented, if not the "last" word in industrial lighting science, at least the "latest." He also emphasized that the Franklin Plan was no hastily conceived effort but one that was truly representative of the best practice in illumination and market promotion, it having had the extended attention of the industry's experts in these two fields of activity.

Over and above this, there was to be remembered the fact that the Franklin Plan was not an untried venture, since it has been in operation in the Chicago territory for two years under the sponsorship of the Electric Association of Chicago, the originator of the idea. Successful experiences in the field were dwelt upon by Mr. Corcoran and actual demonstration of how to apply the specifications to a given industrial or commercial job was presented by Ralph Raymond, lighting specialist of the Electric Association of Chicago.

Industrial Conference Board Organizes Statisticians

THE National Industrial Conference Board of New York City has recently organized a permanent conference of statisticians in industry which meets regularly once a month. It is composed of a group of statisticians and economists of industrial and trade organizations representing, at present, about 30 of the leading industries of the country, including railroad transportation, building construction, and important branches of wholesale and retail distribution. The public utilities of the country are represented by statisticians from the National Electric Light Association, the American Electric Railway Association, the American Gas Association, and the American Telephone and Telegraph Company.

The Conference has been established for the purpose of extending and improving the statistical analyses and interpretation of current business conditions. It is felt that in this way industry and trade will be furnished with more prompt and authoritative information of the current business situation, based upon careful study of available business statistics and their evaluation in the light of the practical experience of industry itself.

Sloan Tells of Merchandising Plans at N. Y. Electrical League Luncheon

THE selling of electrical appliances to the public was begun by the New York Edison Company on Jan. 2. Full details of merchandising methods, however, have not yet been worked out. Speaking before the New York Electrical League at luncheon on Jan. 9, President M. S. Sloan said:

"We intend in future to sell electrical appliances at the showrooms of the New York Edison Company just as they are being sold by other companies in the system. . . . The thought behind the old situation was that the utility was interested only in the use of energy by its customers and that by refraining from selling appliances itself it left equal opportunity and an open field to all venders. As a matter of fact, it didn't work out that way, and you know it didn't as well as I do. All dealers and all contractors did not get equal advantages from this practice, and I doubt whether the company's refraining from actual sales of appliances was of real benefit to anybody. . . .

"We shall not cut prices or do anything else, directly or indirectly, to place any contractor or dealer under unfair competition. We shall endeavor to stimulate this branch of our business by advertising as we do other branches of our business. I believe this advertising will be of such character as will result in sales of electrical merchandising not by us alone but also by others who carry such goods. If it does, we shall be glad to feel that our new course is of benefit and profit to others in the industry as well as to ourselves. Our interest as a public utility supplying electrical service is and always will remain primarily in the increased use of energy. Our efforts in merchandising of apparatus will be directed and shaped to that end. The more energy-using devices sold—whoever makes the sales—the more electricity will be used and the more value the public will get out of electric service."

At the Electrical League luncheon President Earl Whitehorne, Vice-Presidents T. H. Joseph, W. A. Kennedy and C. L. Law, Treasurer L. L. Strauss and Secretary D. T. Brown were reelected for 1929. L. A. Coleman, Edward De Forest, G. T. Dunklin, E. P. Prezzano and Grant Armor were elected as directors for three years, Mr. Armor's being the only new name.

Program for Midwest Power Conference

SIX general sessions, three luncheon meetings and a banquet and dance will make up the program of the Fourth Midwest Power Conference, to be held in Chicago from Feb. 12 to Feb. 15. All meetings and sessions will be at the Palmer House, where a total of twenty papers will be presented.

On Tuesday the conference will begin with a "get-together" luncheon. Wednesday morning will be devoted to metallurgical and chemical problems, with three papers by authorities in this field. The afternoon session, controlled by members of the American Institute of Electrical Engineers, will cover electrical engineering subjects. On Wednesday evening the banquet and dance will immediately follow a notable address. On Thursday morning problems in heating, ventilating and refrigeration will be covered, and in the afternoon three papers under the general classification of power-plant operation will be given. The Friday morning session will be devoted to power-plant economics, with three papers by members of the American Society of Mechanical Engineers. The conference will close at noon on that day, giving engineers an opportunity of visiting the Power Exposition, which will be held during the same week in Chicago. Visiting engineers may avail themselves of the opportunity to visit any one of a list of fifty or more modern industrial and utility plants in the Chicago area which will be open for their inspection.

Picked up from

ELECTRICAL NEWS ITEMS

Issued weekly by Department of Public Information, National Electric Light Association, 420 Lexington Avenue, New York City. All or part may be used without further notice and with or without credit being given.

THE most interesting item to be found in the January output of Electrical News Items is the monthly story on the demand for power as an index to manufacturing activity and general prosperity. Proceeding on the theory that general business activity is synonymous with the activity of factory machinery, the Statistical Department of the National Electric Light Association has, after two years of investigation, reached the conclusion that the amount of electric power used in any given month or season, when compared with the demand for the same period in previous years, will indicate clearly the state of the country's industrial activity.

The figures for the month of November, 1928, tend to show that business was about 6 per cent better than it was at the same time in 1927, but that it receded 1 per cent from the extraordinarily high level of October. The total output of electricity showed an increase of 13 per cent over November, 1927, but part of this was due to the normal growth of the light and power industry and part to the comparatively much greater activity of the mines, mills and commercial establishments of the country.

Electrical Energy Moves Three-fourths of All Machinery

"ELECTRICAL Energy, privately generated and purchased, today is the power running practically three-quarters of the nation's installed machinery," says Robert M. Davis, statistical editor of the McGraw-Hill Publishing Company, in an article in the Jan. 1 issue of *Power*. In his opinion, the trend is distinctly toward a further proportionate increase in the amount of electrically driven machinery as against all other types of power.

Production in 1928

MORE electrical energy for homes, factories, street lighting, and the thousands of uses to which it is applied, was produced by the electric light and power industry in this country during the first eleven months of 1928 than was developed during the entire twelve months of 1927. The production of 74,500,000,000 kilowatt hours during those eleven months of 1928 is compared with the total 1927 production of 74,335,070,000 kilowatt hours.

That this increase in the output of electrical energy is a constantly increasing process is evident from the output of 1926, when the total number of kilowatt hours produced was 67,775,000,000. More energy was made during the first ten months of 1928 than was produced during the entire year of 1926.

The Cost of Electric Service

ALTHOUGH electrical apparatus and equipment now costs from 60 to 75 per cent more than in 1913, and wages and the cost of coal per ton are approximately 200 per cent greater, the average price for *all* electricity (light, power and traction) sold to the people of the United States was the same in 1928 as in 1913. If domestic rates for electric service had risen from 1913 to 1928 as much, proportionately, as the cost of living has increased, it would have involved an additional charge to the public of approximately $550,000,000 more in 1928 than the amount actually collected by the electric light and power industry.

Putting it another way, the average price for household electricity in 1928 was 6.75 cents per kilowatt-hour as against 8.7 cents in 1913. On the other hand, the cost of living is still 70 per cent above 1913. If the cost of domestic service had increased at the same rate as the cost of living, it would now stand at 14.75 cents a kilowatt-hour. It has thus decreased—in terms of cost of living—by 54 per cent, and now stands at 46 per cent of the 1913 value.

Interconnected Systems Continue to Replace Isolated Plants

REMARKABLE results in the replacement of isolated electric power plants by interconnected systems whose current is supplied by large, centralized plants, is shown by the United States Bureau of the Census summary of electric light and power plants in Kentucky.

In 1922, there were 111 individual commercial systems operating in that State. By 1927, this number had declined to 33, a shrinkage of 70 per cent. This tendency toward consolidation is described by the Census Bureau as follows: "The apparent decrease in the number of commercial establishments during the five-year period (representing the net result of a gain of 11 and a loss of 89), is chiefly a result of the centralization of ownership or control and the absorption of independent generating stations accompanying the extension of transmission lines."

Equally striking is the decrease in the number of municipal systems during these same five years. This has shrunk from 27, in 1922, to 8, in 1927, a similar decline of 70 per cent; and its causes are described by the Census as being "due to the abandonment of municipal generating stations and the acquisition of municipal distribution lines by commercial systems."

Even to the Grave

AND now municipal operation is to follow us even to the grave, if we allow ourselves to be informed by an article by Paul Blanshard, in a recent issue of *The Nation*. Mr. Blanshard wants the cities of the United States to establish municipal burial offices. These bureaus, he emphasizes, will enable us to take the final step more economically and will protect us from the "piratical levies of the private morticians."

"The development of municipal funeral bureaus in America," he states, "would be the sanest and most obvious answer to the problems of funeral costs, but there are few cities in America progressive enough to fight private ownership propaganda successfully."

It is appreciably cheaper, Mr. Blanshard points out, to be buried in Cologne or Vienna than it is in the United States. He cites instances of American undertakers preying on the sympathies of our poor people and charging them exorbitant prices for caskets and paraphernalia. Also, if all our dead were cremated, we would save at least 22,000 acres of land every year.

What Is Prosperity?

DISCUSSING the meaning of the word Prosperity in the January issue of *The Industrial Digest*, Jose Bornn, Jr., financial editor, says: "The fact is that prosperity, in the final analysis, is as much a reflection of the prevailing psychology as it is a tangible statistical entity. It is nothing more or less than a standard of living. For example, if we judge our present scale of production and living by our mode of life in pre-war years, we must conclude that we are prosperous beyond the wildest dreams of that time. In other words, we must have some perspective in order to determine what is 'normal.' We are entirely too close to present-day events—we actually cannot tell what 'normalcy' is in the light of today's psychology, and if we cannot define 'normalcy' how under the sun are we going to know whether we are really prosperous or not."

After calling attention to statements issued by the Statistical Research Department of the National Electric Light Association, which appear in *Electrical News Items*, Mr. Bornn notes that "the demand for industrial power serves as an unusually accurate index of conditions throughout American industry," and concludes as follows:

"What has all this to do with our original question: 'What is prosperity?' It would seem that the Statistical Department of the National Electric Light Association might have gone just a little further and philosophized a bit on this whole question of the relation of demand for electricity to prosperity—not the prosperity represented solely by business activity, but the prosperity represented by a 'state of mind.' After all, doesn't it represent a standard of living which is not even comparable with the standard of pre-war days? Doesn't it represent a demand for things in the home in the way of labor-saving devices operated by electricity such as oil burners, electric refrigerators, vacuum cleaners, washing machines, sewing machines, and what not? What would our grandmothers and grandfathers, or even our mothers and fathers have said if they could have seen a modern electrified home? What would the farmer of colonial times think if he could come back and see an electrified farm with electric lights, running water, electric feed grinding, milking, pumping and a thousand and one other chores being done by mechanical servants which, in his day, meant nothing but endless drudgery?

"And doesn't this steady increase in manufacturing, business, amusements, and general activities of all kinds represent nothing more or less than a steady demand for an increase, or, rather, an improvement, in standards of living? If the answer to these questions is 'yes,' then the increase in demand for electricity represents not only a statistical prosperity, but a psychological prosperity which, after all, may be the only real prosperity."

The "Age of White Coal" Not Yet With Us

ACCORDING to Professor W. O. Blanchard, writing in the *Scientific Monthly* for January, "the age of white coal and the age of oil, of which so much is heard, are not with us yet. All of the water power of the world developed to date (about 3 per cent of the total potential) is replacable by only about 116 million short tons of coal, a little more than the yearly output of the State of West Virginia, while all the world's potential petroleum production is equivalent to the combined coal output of but two States—West Virginia and Pennsylvania."

On the Occasion of a Ground Breaking

(*Continued from page* 84)

vice-president of the Philadelphia company. He always recognized his duty as trustee for all interests. Knowing this great man as we all did, will any man doubt that this station which bears his name is dedicated in the highest sense, as long as one brick rests on another, to honest public service and to fair dealing between man and man? In placing this dear name upon this station, we pledge ourselves and our successors for all time to honor it and never do anything to bring it into disrepute. Out of the James H. Reed station shall flow not only electric current but good will and good service in the highest sense.

WHAT OCCURRED LAST MONTH

Consolidations

The Buffalo, Niagara & Eastern Power Corp. has filed with the Public Service Commission of New York an application for permission to consolidate the various holdings of this company into one organization to be known as the Niagara Power Corp. It will exchange its securities for those of the Buffalo General Electric Co., the Niagara Falls Power Co., the Niagara, Lockport & Ontario Power Co., the Tonawanda Power Co., and subsidiaries.

* * *

The Keystone Public Service Co. of Pennsylvania has taken over the properties of the Citizens Light & Power Co. of Oil City, Pa., and the Titusville, Pa., Light & Power Co.

* * *

The Southern Public Utilities Co. of Charlotte, S. C., has purchased the South Carolina Gas & Electric Co., with headquarters at Spartanburg. The two companies are associated with the Duke Power Co.

* * *

Plans have been announced for unification in the New York State Electric Corp. of all of the properties of the Associated Gas & Electric system in New York, except those in Staten Island and Long Island, and those near Buffalo. With the merger of properties the New York State Electric Corp. will embrace 73 units which originally were independent.

* * *

On Jan. 2, coordination of the operations of the Interstate Public Service Co., subsidiaries of the Midland Utilities Co., and subsidiaries of the Central Indiana Power Co., through centralized supervisory management, was announced.

* * *

The Georgia Power Co. has purchased properties in Georgia of the Augusta-Aiken Railway & Electric Corp. and the Georgia-Carolina Power Co.

* * *

Assemblyman Post has introduced in the New York Assembly a resolution asking appointment of a committee for the purpose of investigating the subject of present and proposed mergers of electric companies. The resolution apparently is inspired by a rumor of a great merger on the Atlantic seaboard.

* * *

Colleges and Propaganda

The American Association of University Professors, at its closing session at Columbia University, on Jan. 1, decided against taking immediate action on a resolution which voiced condemnation of "under-cover efforts to utilize college teachers for propaganda purposes." The Association announced that its Committee on Ethics is following testimony presented at the Trade Commission's hearings and will made recommendations later.

* * *

Earnings of Public Utilities

Gross earnings of public utility companies in November, exclusive of telephone and telegraph companies, as reported to the Department of Commerce by 95 companies or systems, were $193,000,000, as compared with $186,000,000 in October, and $182,077,497 in November, 1927.

* * *

The Federal Trade Commission's Investigation

The application of the Federal Trade Commission for a court order requiring certain officers and employees of the Electric Bond & Share Co. to produce certain records and answer certain questions, came on for hearing on Jan. 8 in the United States District Court for the Southern District of New York. The hearing was postponed until Feb. 5. The Electric Bond & Share Co. filed an answer to the Commission's application.

* * *

On Jan. 10, L. C. Bradley, former director of the Alabama Public Utilities Information Bureau, testified before the Federal Trade Commission concerning activities of this Bureau during its existence, commencing in 1923, and ending in 1926. On Jan. 11, Mrs. John D. Sherman, former president of the General Federation of Women's Clubs, appearing as a voluntary witness, gave evidence concerning articles she had written and payments for them which she had received. George F. Oxley, of the N.E.L.A. was recalled to the stand in connection with payments for the articles.

* * *

On Jan. 16, H. C. Spurr and A. S. Hills testified concerning the finances of Public Utilities Reports, Inc., of Rochester, N. Y., and concerning the nature of the publication, saying that Public Utilities Reports are records of decisions bearing on public utilities and that the support for the publication, which operates at a loss, is supplied by the Utilities Publication Committee, on which the N.E.L.A. and the A.E.R.A. are represented. William H. Onken, Jr., senior editor of the *Electrical World*, was also a witness.

* * *

On Jan. 18, Paul S. Clapp, managing director of the N.E.L.A., and George F. Oxley, director, Department of Public Information, were witnesses at the hearing. Mr. Clapp told of support given by the N.E.L.A. to an experimental project in rural electrification conducted at an agricultural extension station at the University of Maryland. Mr. Clapp said that the University was not financially connected with the experimental project. Mr. Oxley told of a survey of the situation in Ontario which was conducted by the N.E.L.A.

On Jan. 16, the Federal Trade Commission announced that it had filed with the Senate its Tenth Interim Report on the utilities investigation.

* * *

On Jan. 18, Professor M. G. Glaeser of the University of Wisconsin, author of a textbook called "Outline of Public Utility Regulation," also appeared as a witness. He testified that the N.E.L.A. had no part in the financing of the publication of his textbook.

* * *

Exports of Electrical Equipment

The Department of Commerce announced that in November a new record since the war for one month's exports of electrical equipment was made, shipments amounting to $10,851,811, an increase of $789,607 over November, 1927.

* * *

Holding Companies

On Jan. 10, announcement was made of the formation by J. P. Morgan & Co., Drexel & Co., and Bonbright & Co., Inc., of the United Corporation, organized for the purpose of acquiring minority stock interests in the United Gas Improvement Co., the Public Service Corporation of New Jersey, and the Mohawk-Hudson Power Corp., held by the organizers and by the American Super Power Corp.

* * *

Hydro-Electric

Governor Roosevelt of New York, in his inaugural address, Jan. 1, and his first message to the Legislature on Jan. 2, pointed out the urgency of settling the water-power question in New York, expressing the hope that settlement will not be delayed by partisan dispute. He declared that title to the States water-power must rest forever in the people of the State and must not be alienated by long-term leases.

* * *

On Dec. 29, individuals and organizations protesting against the issuance of a license to permit development of Cumberland Falls, Ky., for power purposes, filed a brief with the Federal Power Commission. Among the protestants are the Camp Fire Club of America, the Izaak Walton League, the American Civic Association and the National Conference on State Parks.

* * *

Premier King of Canada has stated that there will be no immediate decision on the application of the Beauharnois Power Co. for a permit to commence operation on their power scheme on the St. Lawrence.

* * *

The Ontario Hydro Commission has decided to install a tenth and final unit of 65,000 hp. at its Queenston plant on the Niagara River. This will raise the capacity of the plant to 625,000 hp.

* * *

On Jan. 2 the American Minister at Ottawa, William B. Phillips, and the Prime Minister of Canada signed a convention providing for construction of remedial works in the Niagara River above the Falls. The convention provides for a temporary diversion of an additional amount of water on each side of the boundary not to exceed 20,000 cu. ft. per second, for the purpose of determining the efficacy of the remedial works.

* * *

The Central Maine Power Co., in a letter to stockholders dated Jan. 2, says that its hydro-electric plant now being built at Bingham will generate 100,000 hp. and will be the largest in New England.

* * *

On Jan. 5, the American Civil Association filed with the Federal Power Commission a brief opposing the proposed hydro-electric development at Cumberland Falls, Ky., on the ground that it is not of sufficient economic importance to offset the alleged injury to the scenery at the Falls.

* * *

The Provincial Government of British Columbia has approved plans of the West Kootenay Power Co. to develop 80,000 hp. on the Pend Oreille River on a point near the international boundary. Between 4 and 6 million dollars will be expended in the undertaking.

* * *

The Washington Electric Co. of Seattle has applied to the Federal Power Commission for a preliminary permit for a hydro-electric development on the Columbia River twelve miles below Wenatchee, Wash. The plan calls for an ultimate installation of 144,000 kw. An application for a license for a development on Salt River in Gila County, Ariz., has been filed with the Federal Power Commission by James Girand of Phoenix.

* * *

On Jan. 16, the United States Senate adopted a resolution, offered by Senator Nye, directing that all protests which have been received by the Federal Power Commission in opposition to leasing Cumberland Falls for power developments, be transmitted to the Senate.

* * *

On Jan. 19, Major Somervell announced that confidential reports of applications of three power companies for permits for preliminary surveys of the Potomac River for the purpose of hydro-electric developemnt had been transmitted to Major-General Jadwin, Chief of Army Engineers.

* * *

A dispatch from Vancouver, B. C., says that an application now before the Provincial Lands Department proposes to divert the waters of the Chilco River through the coast mountains to the sea, a project, which, if carried out, could develop up to 1,000,000 hp.

* * *

Investment in Utilities

A compilation of public utility financing during 1928, prepared by Pynchon & Co., shows that an additional $1,878,034,945 was invested in domestic power and light companies' securities, $1,000,000,000 of which was for refunding purposes; gross revenue was estimated to be $1,785,000,000, and rate reductions during the last six or seven years represent a saving of $500,000,000 to the public.

* * *

Muscle Shoals

On Dec. 22, President Coolidge transmitted to the House of Representatives a memorandum giving, with legal references, the history of the so-called "pocket veto." The memorandum was prepared by Attorney-General Sargent and called forth by the discussion which has arisen in connection with the "pocket vetoing" of the Norris Muscle Shoals bills. The Parliamentarian of the House, after reading the Attorney-General's communication, stated that the weight of the cases and precedents cited tend to indicate that a bill not signed within the ten days' limitation does not become law, irrespective of whether the ten days is after final adjournment of Congress or between sessions.

* * *

On Jan. 5, Senator McKellar introduced a bill to authorize the Secretary of War to operate the Muscle Shoals plant for power purposes only, selling the electricity to states and municipalities. The Senator proposed the bill, which is similar to the Norris resolution, as a temporary measure. Senator Norris objected to the bill on the ground that it would be useless to pass it until the Supreme Court has ruled on the test case involving the validity of "pocket vetoes."

* * *

On Jan. 5, Representative Almon of Alabama, after a call at the White House, said that President Coolidge desires that the present session of Congress dispose of the Muscle Shoals problem.

* * *

A Scripps-Howard dispatch from Washington says that the War Department is seeking a new and "more satisfactory" contract with the Alabama Power Company for Muscle Shoals power.

* * *

Representative Crisp of Georgia has introduced in the House a bill similar to the Muscle Shoals bill passed at the last session of Congress, but without the $30,000,000 Cove Creek Dam project.

* * *

On Jan. 21, the United States Supreme Court announced that it would hear and review a case involving the question of whether the word "adjournment" in the Federal Constitution refers only to a final adjournment of Congress or covers an adjournment of any session. The validity of the so-called "pocket veto" by the President of a measure passed at the first session of a Congress is involved in this case. The case referred to is that of the Okanogan and other tribes of Indians, but the principle involved is the same as that involved in the President's "pocket veto" of the Norris Muscle Shoals bill.

St. Lawrence Project

On Jan. 14, the United States Supreme Court handed down a decision in the case of the states of Wisconsin, Minnesota, Michigan, Ohio, New York and Pennsylvania, against the Sanitary District of Chicago in regard to the diversion of water from Lake Michigan. The court held that diversion for sanitary purposes or for purposes not in aid of navigation is unlawful. Chicago will be required to arrange other methods of disposal of its sewage than by diversion of water.

* * *

Railway Electrification

On Jan. 2, it was announced that the New York Central Railway is considering plans for electrifying its lines from New York to Buffalo from power to be generated by Niagara Falls.

* * *

Rates

The Durham, N. C., Public Service Co. is asking permission to decrease its rate for electrical current and at the same time to increase street car fares. The Columbus, Ohio, *Dispatch* says that the Columbus Railway Power & Light Co. is suggesting a similar course in Columbus.

* * *

The Georgia Power Co.'s new gas and electric schedules for Atlanta went into effect on Jan. 1. These involve a reduction to nine out of ten consumers, the total saving amounting to $500,000 a year.

* * *

The Public Service Co. of New Hampshire has announced new rate schedules, effective Jan. 1, involving a reduction of $60,000 for the Manchester, New Hampshire, and Lynn, Mass., districts.

* * *

The Queensboro Gas & Electric Co. of New York City has filed with the New York Public Service Commission a new schedule of electric rates calling for a reduction of $175,000 a year.

* * *

On Jan. 7, President M. S. Sloan of the New York Edison Co., testifying at the hearing before the New York Public Service Commission on the subject of master-metering service, said that rate-reductions aggregating approximately $14,000,000 will be made by the power companies comprising the Consolidated Gas Co.'s power system, if and when the sub-metering of electric current in the New York area is eliminated.

* * *

The Public Service Commission of Alabama has issued an order providing for reduced domestic service rates for consumers supplied by the Alabama Power Co. The schedule is lower than that for which the company recently asked approval, itself providing a reduction.

* * *

The Long Island Lighting Co. has asked approval of the New York Public Service Commission of a reduced schedule of rates for Nassau and Suffolk counties.

* * *

The Oklahoma Gas & Electric Co. announces another downward revision of rates for electric current in towns served by that company, beginning with bills rendered after Jan. 15.

* * *

Rate-Bases

The Interstate Commerce Commission and the St. Louis and O'Fallon Railway Co. have filed in the Supreme Court briefs supporting their positions in the celebrated O'Fallon valuation case, which involves the reproduction cost theory.

* * *

On Jan. 3, argument was begun in the Supreme Court at Washington in the St. Louis and O'Fallon Railway Case, in which the question of reproduction cost as a basis of valuation is involved.

* * *

Regulation

A decree entered in the Federal Court for Nebraska is to the effect that Nebraska villages no longer possess the power to regulate by ordinance the rates that public utilities serving them may charge. In 1920 Nebraska adopted a new constitution and this is held to have retained in the state all powers of regulation.

* * *

On Dec. 28, at a meeting of the American Economic Association in Chicago, Professor Ruggles of Harvard declared for federal regulation of interstate electric business through the establishment of federal regional commissions, which could control the activities of the utilities within what he called the twilight zones between state and federal jurisdictions.

* * *

Production of Electricity

The Geological Survey announces that production of electricity in the United States by public utility plants during November was 7,752,648,000 kw-hr., an increase of 13 per cent over November, 1927.

* * *

The St. Lawrence and Chicago's Diversion

On Jan. 17, Representative Rainey of Illinois issued a statement telling of unfavorable effects on Chicago and Illinois of the Supreme Court's recent decision against the diversion of Lake Michigan water by the Chicago Sanitary District. Mr. Rainey said that the decision "leaves $20,000,000 of state bonds high and dry" and will destroy a considerable water-power development at the outlet of the Chicago Ship Canal. He also declares that reduction of the diversion would be a blow to the proposed deep waterway to the Gulf. On Jan. 15, the Illinois delegation in Congress held a meeting in Washington with the idea of mapping out a plan of action. It is reported that they will press for Congressional legislation authorizing water-diversion for navigation.

* * *

Sub-Metering

The Public Service Commission of New Jersey recently sustained the contention of the Public Service Electric & Gas Co. of New Jersey in its refusal to install a master meter where submeters were also to be installed. The proposal of the New York Public Service Commission, made by the Consolidated Gas Co.'s group of electric companies, is being opposed by the Real Estate Board of New York, the Building Managers and Owners' Association and other real estate interests.

WITH OUR CONTEMPORARIES

One Reason, Anyway, Why They Invest

When you read that the Pennsylvania Railroad is to spend $100,000,000 for electrification, that the New York Central plans to spend as much, that New York Telephone has mapped out a program of $90,000,000 for construction this year, the largest in history, that American Telephone & Telegraph may spend around $100,000,000, that the light and power companies combined will spend billions for new construction, etc., you have a good explanation of why there has been such buying of stocks of the good electric companies.—*Wall Street Journal.*

Year of Mergers

The year 1928 has been characterized as "the year of mergers," but from present indications it will be light in comparison to the combinations to be put together in 1929. Conversations between no less than two dozen corporations engaged in various lies of business are under way. It has been found that little objection has been entered by the Federal Trade Commission to amalgamations when it can be proved that they will be beneficial to the corporations themselves and to the territories served. No less than five mergers, all of them of major size, probably will be announced early in the new year. The largest and most ambitious of them is an oil combination in which several independents will be put together.—New York *Times.*

Poor Tools for Good Workmen

While illuminating engineers have learned much about the physiological factors of their art, have investigated intensities, glare, distribution and backgrounds and have obtained lamps of excellent light characteristics, the fixtures in which they are placed are in general an abomination passing all understanding. The modern note is being stifled to attain uniformity; the best of the old is neglected.

One glance at a catalog of current offerings of home-lighting devices is sufficient to prove the point, for here are imitations of oil lamps set in an annulus of thin-rolled brass; horrible contortions of glass, a material which may be made incomparably lovely; dust catchers, eyesores, painted atrocities and hopeless relics of precedent. Electric light is as much a part of the modern home as the walls, doors, floors and windows. It is not something to be supplied by sticking a shining brass creation of glass and lamps in the middle of the room or on the walls like a picture.

Light should be built in. It should be supplied from invisible or unobtrusive sources. It should be a part of the design of the room. Decorative lighting, whether of floor or table lamps or ornamental figures, should be supplementary. This is a plea for the intelligent application of the knowledge at hand, waiting to be used, and of the facilities readily available. If the original Wright machine were used in airmail service today, it would be no less ridiculous than is the manufacture of lighting fixtures, particularly home devices, blindly supplying gewgaws that were, esthetically, none too satisfactory yesterday. Almost any new house or apartment is a horrible example of the things which may be done in meeting the builder's ideas of what is good enough.—*Electrical World.*

Water Power Sites and Electric Service

* * * We would not imply that water-power sites which are the property of the whole people should be allowed to fall into the hands of corporations without thoroughly adequate safeguards. But those who discuss the subject so often give the impression in their diatribes against corporate activity that the only alternative to loot and theft of national resources is government ownership and as much government operation as possible. The companies are painted so black that one might suppose that their sole object in developing power is to keep it away from public use. The erroneous impression is given that no safeguards exist against the greedy exploitation of water-power sites by selfish private interests.

It seems to us that if the electric and power interests of this country were becoming altogether too greedy, reckless and arrogant, as their opponents maintain, the signs of their guilt would be found in the service provided, not from the relatively smaller source of hydroelectric generation but from steam plants.* * *—*Saturday Evening Post.*

Coal and Waterpower

* * * It is as a source of power that both bituminous coal and anthracite must gain in value and importance with the shift from steam to electricity in general industry. This great hubbub in and out of politics over the subject of waterpower facilities offers a case in point. Yet if all the natural water power resources of North America were to be

at once developed to their full capacity—and this is not excluding Muscle Shoals, Niagara Falls, Boulder Dam and the rest of the proposed great Western projects—they could deliver only about 25 per cent of the electrical energy that will be required when present plans for the electrification of railways and farms are carried through. So then, entirely apart from Muscle Shoals' potentialities, it is conceivable that Alabama's well-nigh limitless reserves of soft coal ultimately will make of this commonwealth a central source of electric power for all the Southern States. In due course—and this, too, conceivably—power stations of immense capacity will be established at the mines, and they are likely to overshadow in economic importance, the greatest of the hydro-electric generating systems. Such centralization of facilities is possible with modern methods of long-distance electric power transmission. * * *

The coal industry in general has of late been going through one of the severest depressions in its history. Yet, in the opinion of those now directing spectacular revolutions in the technique of industrial production, coal is of increasing importance as a primary commodity and likely to figure much more largely in the economic scheme of the future than it has done in the past.—Birmingham, Ala., *News*.

Social Development of Small Communities and Electric Power

In spite of the steady increase in recent years in the amount of electricity produced in the United States, the number of generating stations in operation is 543 less than in 1920, according to the United States Geological Survey. Small stations of uncertain efficiency, are being replaced by large stations serving wide territories.

An electric company can adequately serve a single community only when it can reach a large closely settled population. In sparsely settled sections, the area served must be sufficiently large to overcome the smallness of population. To meet this need, pooling of power resources through interconnection of transmission lines, was innovated, and with outstanding success.

The result of this system is shown in an important agricultural state. Fifteen years ago a public utility investment company acquired nine plants in as many small towns and connected them into a unified system. From year to year more plants were added until the total, at present, is 140 in towns with average populations of 1800.

Previously, 46 of these towns had no electric service and many of them would have none today if they still were forced to depend on local plants. Of those which had electricity, 33 had only night service, and the remaining communities were served by small plants with limited facilities and at a high cost. Now all the communities receive continuous high-grade service.

Industrial decentralization, farm electrification and social development of small communities are to a great extent the result of uniform distribution of electricity.—San Francisco, Cal., *Mission Enterprise.*

REVIEWS OF N. E. L. A. AND RELATED PUBLICATIONS

Government (Political) Ownership and Operation and the Electric Light and Power Industry: N.E.L.A. Pub. No. 289-13, 530 pages. Price, $1.50 per copy. Substantial reductions for quantity orders.

THIS publication was prepared primarily for the information of member companies of the Association, but it is also intended for a more general distribution since it makes available in one place an imposing array of authentic facts, statements, views of leaders of thought and arguments showing the trend away from political ownership and operation of electric light and power companies. It is, fundamentally, a thesis in opposition to the intrusion of government into business.

It is obvious from the treatment of the material contained in this book that the editors have attempted to include only the most pertinent of the wealth of material that is at hand in propounding the above doctrine. The first chapter deals with the general history of some of the well-known ventures of municipal, state and national agencies into competition with private industry and the results that have attended these experiments. The beginnings of the electrical industry are cited to show how many municipal plants came to be started, and facts and figures are included to show the results. The charts in this first chapter graphically picture the municipal situation as it exists in the country today and the relative unimportance of the output of the city operated power companies.

The second chapter lists a number of questions and answers on this general question, the questions being those that most generally arise in discussions of municipal operation.

The next chapter is important since it is devoted to the opinions of leaders of thought, prominent industrialists, newspapers, commissions, etc. These are listed under separate headings for easy reference.

Chapters IV and V give facts and authentic statements on the large number of municipalities that have abandoned political operation of their electric utilities and are now taking service from privately owned and operated companies. It is specified in each case whether the town, city or village still owns its distribution system and purchases energy wholesale or whether the distribution system as well as the generating facilities have been sold or abandoned in favor of efficient, twenty-four hour service from private companies. This information is listed alphabetically under state headings.

As an official publication of the National Electric Light Association dealing with problems that not only are of concern to everyone connected with or interested in the industry, but are also vital issues of government and politics, this book is a distinct and valuable contribution. Factual in every sense of the word and general in its treatment of the subject as well as specific in its dealing with definite cases, it is invaluable for reference and a veritable mine of information.—R. S.

Developing Electric Service for the Farm. Serial Report of the Rural Electric Service Committee. N.E.L.A. publication No. 289-12; 15 pp. Price 25 cents; to members, 15 cents.

TO make available practical information as to how electric light and power companies may organize to develop electric service on the farm, the Rural Electric Service Committee has undertaken issuance of a series of reports which reflect in detail how this class of business is being handled by a number of companies.

This report is the first of the series. It sets forth the experiences of the Wisconsin Power & Light Company located at Madison, Wis., and describes in detail the agricultural characteristics of the territory served, the company organization, the activities of the rural service department, the procedure in establishing service, the rates and contract forms for rural service, rural line building, service to farm customers, meter reading, developing appreciation of electric service (in the company and on the farm), selling equipment, the ideal arrangement for dealing with rural customers, cooperation with other agencies and the results obtained.

Illustrative charts and maps make the report interesting, and it will undoubtedly suggest new ideas even to the company which has had considerable rural electrification experience.—V. W. P.

Recommended Practices for Design and Construction of Rural Lines: N.E.L.A. Pub. No. 289-16, 28 pages. Price 40 cents; to members, 25 cents.

THIS report of the Overhead Systems Committee, Engineering National Section, discusses the various phases of rural electric line construction, some of which are: Location of lines and poles, voltage, span lengths, types and sizes of poles (with clearance charts and tables of ultimate fiber stresses and resisting moments), grading of lines, pole framing, excavation for poles (with

(*Continued on page* 128)

Member Companies of the National Electric Light Association

THE lists appended hereto present the names of the member companies of the National Electric Light Association as of Jan. 1, 1929, with the exception of Classes F and H, which will appear in the next issue. They are classified as follows:

Class A (Light and power companies)	755
Class D (Manufacturers)	416
Class F (Associate companies)	402
Class H (Foreign)	128
	1,701

In addition to its member companies, the Association has 18,944 individual members, classified thus:

Class B (Employees of light and power companies)	15,192
Class C (Invited members)	113
Class E (Employees of manufacturer comoanies)	2,867
Class G (Employees of associate companies)	710
Class I (Foreign individual members)	62
	18,944

Total all classes of members, 20,645.

The names of the light and power companies invariably are listed at the principal place of production or distribution of energy. Where the general office of any company is located at some other point, the address of the general office is shown immediately following the name of the company.

Light and power companies (Class A) are listed first, followed in sequence by companies or firms engaged in the manufacture of electrical apparatus or equipment for the production or use of electrical energy (Class D); companies or firms of electrical jobbers, contractors, dealers, electrical or mechanical engineers, publishers, associations or others, corporations or individuals who are interested in advancing the use of electrical energy (Class F); and individuals or corporations not residents of North America engaged in the central station industry, or interested in advancing the use of electrical energy (Class H).

Light and Power Companies

(Class A)

"Class A members shall be regularly incorporated public service companies engaged in producing and supplying electrical energy for light, heat or power for public use." — *Constitution, Art. III, Sec. 2.*

Alabama

Birmingham—Alabama Power Company; Birmingham Electric Company.
River Falls—River Falls Power Company.

Arizona

Flagstaff—Flagstaff Electric Light Company.
Kingman—Public Utilities Consolidated Corporation.
Nogales—Southern Arizona Power Company.
Phoenix—Arizona Edison Company; Central Arizona Light & Power Company.
Prescott—The Arizona Power Company.
Tucson—The Tucson Gas, Electric Light & Power Company.
Winslow—Arizona Electric Power Company.

Arkansas

Blytheville—Arkansas-Missouri Power Company.
Fort Smith—Fort Smith Light & Traction Co.
Helena—Arkansas Utilities Company.
Hot Springs National Park—Citizens Electric Company.
Pine Bluff—Arkansas Power & Light Company.
Warren—Arkansas General Utilities Company.
(Harrisburg, Pa.)

California

Bay Point—Bay Point Light & Power Company.
Boulder Creek—Public Utilities California Corporation.
Fresno—San Joaquin Light & Power Corporation.
Los Angeles—Los Angeles Gas & Electric Corporation.
(Box 1100, Station C)
Southern California Edison Company.
Ontario—Ontario Power Company.
Riverside—The Southern Sierras Power Company.
St. Helena—Napa Valley Electric Company.
San Diego—San Diego Consolidated Gas & Electric Company.
(P. O. Box 1374)
San Francisco—Feather River Power Company
(530 Bush Street)
Great Western Power Company of California
(225 Bush Street)
Pacific Gas & Electric Company
(245 Market Street)
Peoples California Hydro-Electric Corporation
(Portland, Ore.)
Coast Counties Gas & Electric Company
(2500 Russ Bldg.)
Vallejo—Vallejo Electric Light & Power Company.

(Class A Members Continued)

Willits—Central Mendocino County Power Company.

Colorado

Denver—Public Service Company of Colorado.
Summit County Power Company
(1066 Gas & Electric Bldg.)
Durango—Western Colorado Power Company.
Evergreen—Evergreen Public Service Company.
Glenwood Springs—The Glenwood Light & Water Company.
Golden—Colorado Central Power Company.
Greeley—The Home Gas & Electric Company.
Pueblo—Southern Colorado Power Company.
Silverton—The Silverton Electric Light Company.
Trinidad—The Trinidad Electric Trans. Ry. & Gas Company.

Connecticut

Danbury—Danbury & Bethel Gas & Electric Light Company.
Derby—The Derby Gas & Electric Company.
East Hampton—Central Connecticut Power & Light Company.
Hartford—The Hartford Electric Light Company.
Litchfield—The Litchfield Electric Light & Power Company.
Mystic—Mystic Power Company.
New London—Connecticut Power Company.
Norwich—The Eastern Connecticut Power Company.
South Manchester—Manchester Electric Company.
Stamford—The Stamford Gas & Electric Company.
Thompsonville—The Northern Connecticut Power Company.
Waterbury—The Connecticut Light & Power Company.
Willimantic—Rockville-Willimantic Ltg. Company.

Delaware

Wilmington—American Power Company; Delaware Electric Power Company.

Dist. Columbia

Washington—Potomac Electric Power Company.

Florida

Auburndale—Auburndale Power Company.
Fernandina—Southern States Power Company.
Hastings—Hastings Power & Ice Company.
Key West—The Key West Electric Company.
Madison—Madison County Power Company.
Miami—Florida Power & Light Company.
Monticello—The Jefferson County Power Company.
Pensacola—Gulf Power Company.
Perry—Taylor County Power Company.
St. Petersburg—Florida Power Corporation.
Tampa—Tampa Electric Company.

Georgia

Albany—South Georgia Power Company.
Atlanta—Georgia Power Company.
(Electric & Gas Building)
Augusta—Augusta Aiken Railway & Electric Corporation.
Blue Ridge—Toccoa Electric Power Company.
(Tennessee Electric Power Building, Chattanooga, Tenn.)

(Class A Members Continued)

Brunswick—Mutual Light & Water Company.
Camilla—Baker County Power Company.
Columbus—Columbus Electric & Power Company.
Griffin—Georgia Hydro-Electric Company.
Macon—Macon Railway & Light Company.
Savannah—Savannah Electric & Power Company.
Valdosta—Georgia Power and Light Company.

Idaho

Boise—Idaho Power Company.
Coeur D'Alene—Kootenai Power Company, Ltd.
Salmon—Salmon River Power & Light Company.
Wallace—Public Utilities Consolidation Corporation.
(Wallace Division)

Illinois

Alton—Alton Light & Power Company.
Aurora—Western United Gas & Electric Company.
Chicago—Byllesby Engineering & Management Corporation.
(231 So. LaSalle Street)
Central Public Service Corporation
(105 West Adams Street)
Commonwealth Edison Company
(72 West Adams Street)
Illinois Power & Light Corporation
(231 So. LaSalle Street)
Inland Power & Light Corporation
(79 West Monroe Street)
Middle West Utilities Company
(72 West Adams Street)
Midland Utilities Company
(2025 122 South Michigan Avenue)
National Public Utilities Company
(39 South LaSalle Street, Room 1420)
North American Light & Power Company

Public Service Company of Northern Illinois
(72 West Adams Street)
The United Light & Power Company
(2200 Bankers Building)
United Public Service Company
(100 West Monroe Street)
Utilities Management Company
(29 South LaSalle Street)
Chicago—Utilities Power & Light Corporation.
(327 South LaSalle Street)
Dixon—Illinois Northern Utilities Company.
East St. Louis—East St. Louis Light & Power Company.
Galena—Interstate Light & Power Company.
Lincoln—Illinois Public Utility Company.
Moline—People's Power Company.
Mt. Carmel—Mt. Carmel Public Utility & Service Company.
Peoria—Central Illinois Light Company.
Rockford—Rockford Electric Company.
Springfield—Central Illinois Public Service Company; Illinois Power Company.

Indiana

Anderson—Traction Light & Power Company.
Attica—Attica Electric Company.
Clinton—Wabash Valley Electric Company.
Evansville—Southern Indiana Gas & Electric Company.
Ft. Wayne—Indiana Service Corporation.
Greensburg—Hoosier Public Utility Company.
Hammond—Northern Indiana Public Service Company.

(Class A Members Continued)

Indianapolis—Central Indiana Power Company.
(606 Guaranty Building)
Indianapolis Power & Light Company.
(48 Monument Circle)
Interstate Public Service Company
(Wild Building, 129 East Market)
Kokomo—Northern Indiana Power Company.
La Porte—La Porte Gas & Electric Company.
Madison—Madison Light & Power Company.
Marengo—General Utilities Company.
Marion—Indiana General Service Company.
Richmond—The Liberty Light & Power Company.
South Bend—Indiana & Michigan Electric Company.
Terre Haute—Terre Haute Indianapolis & Eastern Traction Company.
(Terre Haute Division)
Union City—Union City Electric Company.
Winchester—Citizens Heat Light & Power Company.

Iowa

Cedar Rapids—Iowa Electric Company; Iowa Railway & Light Corporation.
Centerville—Iowa Southern Utilities.
Clear Lake—Clear Lake Electric Light & Power Company.
Council Bluffs—Citizens Gas & Electric Company.
Davenport—People's Light Company.
Des Moines—Iowa Power and Light Company.
Dubuque—Central States Power and Light Corporation.
Dubuque—Eastern Iowa Electric Company; Interstate Power Company.
Fort Dodge—Fort Dodge Gas & Electric Company.
Fort Madison—Fort Madison Electric Company.
Glenwood—Mills County Power Company.
(Ralston, Neb.)
Iowa City—Iowa City Light & Power Company.
Iowa Falls—Central States Electric Company.
Keokuk—Keokuk Electric Company; Mississippi River Power Company.
Mason City—Peoples Gas & Electric Company.
Northwood—Northwood-Kensett Electric Company.
Sioux City—Iowa Public Service Company; McGraw Electric Company.
(120 South LaSalle Street, Chicago, Ill.)
Sioux City Gas & Electric Company

Kansas

Abilene—The United Power & Light Corporation of Kansas.
Caney—The Caney Electric Company.
Concordia—The Kansas Power Company.
Cottonwood Falls—Inter-County Electric Company.
Fort Scott—Kansas Utilities Company.
Goodland—Public Utilities Consolidated Corporation.
(Goodland Division)
Lawrence—Kansas Electric Power Company.
Salina—The Western Light & Power Corporation.
Topeka—The Kansas Power & Light Company.
Wichita—Kansas Gas & Electric Company.

Kentucky

Augusta—Kentucky Power Company.
Bloomfield—Kentucky Service Company.
Bowling Green—Kentucky-Tennessee Light & Power Company.
Covington—Union Light Heat & Power Company.
Hazard—Kentucky & West Virginia Power Company.
Lexington—Lexington Utilities Company.
Louisville—Kentucky Utilities Company.
(Starks Building)
Louisville Gas & Electric Company.
Maysville—Kentucky Power & Light Company.

Louisiana

Alexandria—Louisiana Ice & Utilities, Inc.
Algiers—Louisiana Power & Light Company.
Baton Rouge—Baton Rouge Electric Company.
Lafayette—Louisiana Public Utilities Company, Inc.
New Iberia—Gulf Public Service Company.
New Orleans—New Orleans Public Service, Inc.
Shreveport—Southwestern Gas & Electric Company.

Maine

Augusta—Central Maine Power Company; New England Public Service Company.
Bangor—Bangor Hydro-Electric Company.
Biddeford—Clark Power Company.
Calais—St. Croix Gas Light Company.
Caribou—Caribou Water, Light & Power Company.
Fort Kent—Fort Kent Electric Company.
Island Falls—Katahdin Electric Company.
Kezar Falls—Cornish & Kezar Falls Light & Power Company.
Milo—Milo Electric Light & Power Company.
Portland—Cumberland County Power & Light Company.
Presque Isle—Gould Electric Company.
Rumford—Rumford Falls Light & Water Company.
South Berwick—Berwick & Salmon Falls Electric Company.
(181 State Street, Boston, Mass.)

(Class A Members Continued)

Maryland

Annapolis—Annapolis & Chesapeake Bay Power Company.
Baltimore—Consolidated Gas Electric Light & Power Company.
(Lexington Bldg., Lexington and Liberty Streets)
General Utilities & Operating Company
(1310 Standard Oil Building)
Hagerstown—The Potomac Edison Company.
Salisbury—Eastern Shore Public Service Company.

Massachusetts

Adams—Adams Gas Light Company.
(77 Franklin Street, Boston, Mass.)
Agawam—Agawam Electric Company.
(73 State Street, Springfield, Mass.)
Amesbury—Amesbury Electric Light Company.
Amherst—Amherst Gas Company.
Athol—Athol Gas & Electric Company.
Attleboro—Attleboro Steam & Electric Company.
Ayer—Ayer Electric Light Company.
Beverly—Beverly Gas & Electric Company.
Boston—Atlantic Public Utilities, Inc.
(250 Stuart Street)
Eastern Massachusetts Electric Company
(200 Devonshire Street)
Edison Electric Illuminating Company of Boston
(70 State Street)
Stone & Webster, Inc.
(49 Federal Street)
Charles H. Tenney & Company
(200 Devonshire Street)
Brockton—Edison Electric Illuminating Company of Brockton.
Cambridge—Cambridge Electric Light Company.
Charlestown—Charlestown Gas & Electric Company.
Clinton—Clinton Gas Light Company.
Easthampton—Easthampton Gas Company
East Pepperell—Middlesex County Electric Company.
East Weymouth—Weymouth Light & Power Company.

Iaeger—United Light & Power Company.
Martinsburg—Potomac Light & Power Company.
Mullens—Union Power Company
(Kanawha National Bank Building, Charleston)
Petersburg—Community Power Company; Potomac Valley Power Corporation.
Piedmont—Piedmont Electric Light & Power Company.
War—War Light & Water Company.
Wheeling—Wheeling Electric Company.

Wisconsin

Abbotsford—Midland Public Service Company.
Amery—Wisconsin Hydro Electric Company.
Ashland—Lake Superior District Power Company.
Eau Claire—Northern States Power Company of Wisconsin.
Green Bay—Wisconsin Public Service Corporation.
Lake Geneva—Southern Wisconsin Electric Company.
Madison—Madison Gas & Electric Company.
Wisconsin Power & Light Company
(16 Carroll Street)
Milwaukee—Milwaukee Electric Railway & Light Company.
Prairie du Chien—Interstate Power Company of Wisconsin
(1000 Main Street, Dubuque, Iowa)
Racine—Wisconsin Gas & Electric Company.
Superior—Superior Water, Light & Power Company.
Waupaca—Waupaca Electric Service & Railway Company.
Wausau—Wisconsin Valley Electric Company.
West Bend—Wisconsin Public Utility Company.

Wyoming

Casper—Mountain States Power Company.
Cheyenne—The Cheyenne Light, Fuel & Power Company.
Lander—Lander Electric Light & Power Company.
Rawlins — The Rawlins Electric Light & Fuel Company.
Sheridan—The Sheridan County Electric Company.

(Class A Members Continued)

Territorial Possessions

Alaska

Cordova—Alaska Public Utilities.
Juneau—Alaska Electric Light & Power Company.
Ketchikan—Citizens Light, Power & Water Company.
Valdez—Prince William Sound Water, Power, Light & Telephone Company.

Hawaii

Hilo—Hilo Electric Light Company, Limited.
Honolulu—The Hawaiian Electric Company, Limited.

Philippine Islands

Manila—The Manila Electric Company.

Porto Rico

Ponce—Ponce Electric Company.
San Juan—Porto Rico Railway, Light & Power Company.

CANADA

Alberta

Calgary—Calgary Power Company, Limited
(164 St. James Street, Montreal, Quebec)
Vegreville Utilities, Limited
(215 Sixth Avenue West)
Vulcan—Vulcan Light & Power Company, Limited.

British Columbia

Fernie—East Kootenay Power Company, Limited.
Rossland—West Kootenay Power & Light Company, Limited.
Vancouver—British Columbia Electric Railway Company, Limited.

Manitoba

Great Falls—Manitoba Power Company, Limited.
Winnipeg—Winnipeg Electric Company.

New Brunswick

Aroostook—Maine & New Brunswick Electric Power Company, Limited
(Presque Isle, Maine)
Bathurst—Bathurst Electric & Water Power Company, Limited.
Fredericton—The Maritime Electric Company, Limited.
Moncton—Moncton Tramways, Electricity & Gas Company, Limited.
St. John—New Brunswick Power Company.
St. Stephen—The Maritime Electric Company, Limited.
Woodstock—Woodstock Electric Railway, Light & Power Company.

Nova Scotia

Amherst—Canada Electric Company, Limited.
Halifax—Nova Scotia Light & Power Company, Limited.
New Waterford—Dominion Utilities Company, Limited.
Sydney—Cape Breton Electric Company.
Windsor—Avon River Power Company, Limited.
Yarmouth—Western Nova Scotia Electric Company, Limited.

Ontario

Arnprior—The Galletta Electric Power & Milling Company.
Cornwall—Stormont Electric Light & Power Company.
Erin—Caledon Electric Company, Limited.
Fort William—Kaministiquia Power Company, Limited.
Gananoque—The Gananoque Electric Light & Water Supply Company, Limited.
Hamilton—Dominion Power & Transmission Company, Limited.
Iroquois Falls—Abitibi Electric Development Company, Limited.
Massey—Lloyd Deagle & Company.
Mattawa—The Mattawa Electric Light & Power Company, Limited.
Merrickville—Rideau Power Company.
New Liskeard—Canada Northern Power Corporation, Limited; Northern Ontario Light & Power Company, Limited; Porcupine Power & Telephone Company, Limited.
Niagara Falls—Canadian Niagara Power Company, Limited.
Ottawa—Gatineau Electric Light Company, Limited; Gatineau Power Company; The Ottawa Electric Company; Ottawa & Hull Power Company, Limited.
Pembroke—The Pembroke Electric Light Company, Limited.
Renfrew—Calabogie Light & Power Company.
Sault Ste Marie—Algoma Steel Corporation, Limited; Great Lakes Power Company.
Timmins—Northern Canada Power, Limited.

Prince Edward Island

Charlottetown—Maritime Electric Company, Limited.

(Class A Members Continued)

Quebec

Angliers—Northern Quebec Power Company, Limited
(Quinze Power House)
Arvida—Duke-Price Power Company, Limited; Saguenay Electric Company.
Buckingham—Albert MacLaren Electric Light Plant.
Chambly—Chambly Power Corporation.
Grand Mere—Laurentide Power Company.
Huntingdon—Beauharnois Electric Company, Limited.
Montreal—Continental Heat & Light Company
(611 Power Building)
Great Northern Power Company
(614 Dominion Express Building)
Montreal Light, Heat & Power Consolidated.
South Shore Light, Heat & Power Corporation
(132 St. James Street)
Southern Canada Power Company
(330 Coristine Building)
Quebec—Quebec Power Company; Quebec Railway Light, Heat & Power Company.
Rimouski—Lower St. Lawrence Power Company.
St. Joseph—St. Francis Light & Power Company.
St. Timothee—The Canadian Light & Power Company.
Shawinigan Falls—Electric Service Corporation.
The Shawinigan Water & Power Company
(Montreal)
Sorel—Sorel Light & Power Company.
Thetford Mines—St. Francis Water Power Company.
Three Rivers—North Shore Power Company.

Saskatchewan

Regina—Arcola Light & Power Company.

Cuba

Havana—Havana Electric Railway, Light & Power Company
(Apartado 570)

Mexico

Guanajuato—Central Mexico Light & Power Company
(2 Rector Street, New York, N. Y.)
Mexico City—The Mexican Light & Power Company, Limited
(Apartado 490)
Monterey — Monterey Railway Light & Power Company
(Apartado 58)

Newfoundland

St. Johns—Newfoundland Light & Power Company, Limited; United Towns Electric Company, Limited.

Manufacturer Companies

Class D

"Class D members shall be companies or firms engaged in the manufacture of apparatus, machinery, equipment, supplies or material for the production or use of electrical energy."—*Constitution, Art. III, Sec.* 5.

Alabama

Birmingham—Bessemer Galvanizing Works
(205 Phoenix Building)

California

Alhambra—C. F. Braun & Company.
Los Angeles—Diamond Electrical Manufacturing Company
(1320 East Sixteenth Street)
Kelman Electric & Manufacturing Company
(1650 Naud Street)
San Francisco—Majestic Electric Appliance Company, Incorporated
(590 Folsom Street)
Pacific Coast Steel Company
(Hunter-Dulin Building)
Pacific Electric Manufacturing Corporation
(5815 Third Street)
The Pelton Water Wheel Company
(Nineteenth and Harrison Streets)

Connecticut

Ansonia—The Ansonia Electrical Company.
Branford—Malleable Iron Fittings Company
(Pole Hardware Department)
Bridgeport—Bryant Electric Company.
Harvey Hubbell, Incorporated.
Reading Steel Casting Company, Inc.
(929 Connecticut Avenue)
Hartford—Colt's Patent Fire Arms Manufacturing Company
(Electrical Division)
The Hart Manufacturing Company
(Hamilton Street)
The States Company
(19 New Park Avenue)

(Class D Members Continued)

Meriden—Manning Bowman & Company
(200 Fifth Avenue, New York, N. Y.)
The Miller Company
(99 Center Street)
New Britain—Landers, Frary & Clark.
New Haven—The Acme Wire Company
(P. O. Drawer 1820)
The Bigelow Company
(P. O. Drawer 706)
The National Electric Condenser Company
(Box 1820)
Products Protection Corporation
(P. O. Box 904)
Rockbestos Products Corporation
(P. O. Box 1102)
Whirldry Corporation, c/o Winchester Repeating Arms Company.
Plainville—The Trumbull Electric Manufacturing Company.
Torrington—The Fitzgerald Manufacturing Company.
Waterbury—The American Brass Company, c/o Anaconda Copper Mining Company
(25 Broadway, New York, N. Y.)
The Beardsley & Wolcott Manufacturing Company.
The Bristol Company.
Scovill Manufacturing Company.

Delaware

Edgemoor—Edgemoor Iron Company.

Florida

Jacksonville—American Cross Arms Company, Inc.
(P. O. Box 82)

Illinois

Aurora—Standard Gas Equipment Corporation
(Acorn Division)
Chicago—American Insulated Wire Division of General Cable Corporation
(954 West Twenty-first Street)
American Ironing Machine Company
(100 East Ohio Street)
Anaconda Copper Mining Company, Rolling Mills Department
(111 West Washington Street)
Automatic Burner Corporation
(312 North May Street)
Beardslee Chandelier Manufacturing Company
(216-20 South Jefferson Street)
Benjamin Electric Manufacturing Company
(128 South Sangamon Street)
Chicago Flexible Shaft Company
(5600 West Roosevelt Road)
Chicago-Jefferson Fuse & Electric Company
(Laflin and Fifteenth Street)
Clements Manufacturing Company
(601-613 Fulton Street)
Conlon Corporation
(Fifty-second Avenue and Nineteenth Street)
Continental Valve & Equipment Company
(82 Herbert Street, Farmingham, Mass.)
Crane Company
(836 South Michigan Avenue)
Crane Packing Company
(1800 Cuyler Avenue)
Curtis Lighting, Incorporated
(1119 West Jackson Boulevard)
Delta Star Electric Company
(2433-2443 Fulton Street)
Economy Fuse & Manufacturing Company
(Greenview Avenue at Diversey Parkway)
Edison Electric Appliance Company, Inc.
(5660 West Taylor Street)
Electric Furniture Corporation
(154 East Erie Street)
Federal Electric Company, Inc.
(8700 South State Street)
G. & W. Electric Specialty Company
(7780 Dante Avenue, Grand Crossing Station)
Hurley Machine Company
(Division of Electric Household Utilities Corporation, West Twenty-second Street and Fifty-fourth Avenue)
Mathias Klein & Sons
(3200 Belmont Avenue)
Kulp Theft Proof Lamp Company
(330 South Wells Street)
MacMarquiz
(4821 Sheridan Road)
The Mercoid Corporation
(25 Church Street, Room 307, New York, N. Y.)
Metal Specialties Manufacturing Company
(338-352 North Kedzie Avenue)
Minerallac Electric Company
(25 North Peoria Street)
Naugle Pole & Tie Company
(5 South Wabash Avenue)
Reynolds Electric Company
(2650 West Congress Street)
Royal Electric Manufacturing Company
(619-621 East Fortieth Street)
W. H. Salisbury & Company, Inc.
(308 West Madison Street)
Schweitzer & Conrad, Inc.
(4431-4439 Ravenswood Avenue)
Standard Oil Company of Indiana
(Technical Division, Lubricating Department, 910 South Michigan Avenue)

(Class D Members Continued)

Triplex Washing Machine Corporation
(644 West Lake Street)
Van Cleef Bros.
(Woodlawn Avenue, Seventy-seventh to Seventy-eighth Streets)
Victor X-Ray Corporation
(2012 Jackson Boulevard)
Walker Vehicle Company
(Eighty-seventh and State Streets, Chesterfield Station)
Harvey—The Buda Company.
Macomb—Illinois Electric Porcelain Company
(512 North Pearl Street)
Peoria—Altorfer Brothers Company.
Rockford—Geo. D. Roper Corporation.
Springfield—Sangamo Electric Company.
Springfield Boiler Company
(1901 East Capital Avenue)
Sycamore—Inland Wire & Cable Company.
Taylorville—Tip's Tool Company, Inc.

Indiana

Brazil—The Clay Products Company.
East Chicago—Edward Valve & Manufacturing Company
(1200 West 145th Street)
Evansville—Servel, Incorporated.
Gary—Walter Bates Steel Corporation.
Indianapolis—Transelectric Company
(518 Traction Terminal Building)
Lafayette—Duncan Electric Manufacturing Company.
Marion—Ruternber Electric Company.
South Bend—South Bend Current Controller Company.

Iowa

Council Bluffs—Giant Manufacturing Company.
Newton—Automatic Electric Washer Company, Inc.; One Minute Manufacturing Company.

Kentucky

Covington—The Wadsworth Electric Manufacturing Company, Inc.

Maine

Portland—Brown Company
(Fibre Conduit Department)

Maryland

Baltimore—Baltimore Copper Mills
(P. O. Highlandtown Branch)
Locke Insulator Corporation
(Maryland Trust Company Building)
May Oil Burner Corporation
(3500 East Biddle Street)

Massachusetts

Ashland—Warren Telechron Company.
Boston—Albert & J. M. Anderson Manufacturing Company
(289-305 A Street)
Bernitz Furnace Appliance Company
(80 Federal Street)
Condit Electrical Manufacturing Corporation
(838 Summer Street)
The Dampney Company of America
(50-60 Business Street, Hyde Park)
Holtzer-Cabot Electric Company
(125 Amory Street, Roxbury)
Simplex Wire & Cable Company
(201 Devonshire Street)
B. F. Sturtevant Company
(Hyde Park)
Walker & Pratt Manufacturing Company
(31-35 Union Street)
Walworth Company
(Statler Building)
Wheeler Reflector Company
(275 Congress Street)
Medford Hillside—Doble Engineering Company.
Springfield—American Electric Service & Maintenance Company.
Waltham—The Palmer Electric & Manufacturing Company.
Watertown—Hood Rubber Company.
Worcester—American Steel & Wire Company
(94 Grove Street)
Devon Manufacturing Company
(677 Calbridge Street)
Riley Stoker Corporation
(9 Neponset Street)
M. S. Wright Company
(164 Fremont Street)

Michigan

Battle Creek—Opalume Division of Consolidated (Electric Sign Corporation)
H. B. Sherman Manufacturing Company
(9 Barney Street)
Bay City—Kuhlman Electric Company.
Detroit—American Airdry Corporation
(2587 East Grand Boulevard)
American Electrical Heater Company.
Bartlett Manufacturing Company
(743 Beaubien Street)
Burroughs Adding Machine Company
(6071 Second Boulevard)
Copeland Products, Incorporated
(630 Lycaste Avenue)
Diamond Power Specialty Corporation
(10340 Oakland Avenue)

(Class D Members Continued)

Eureka Vacuum Cleaner Company
(Hamilton and Dewey Avenues)
Ironrite Ironer Company
(38 Piquette Avenue)
Kelvinator Corporation
(14250 Plymouth Road)
Knott & Garllus Company
(3945-3951 "A" Street)
Lineman Protector Company
(2008 Penobscot Building)
McCord Radiator & Manufacturing Corporation
(2587 East Grand Boulevard)
The Peninsula-Stove Company
(1417 Fort Street West)
Square D Company
(6060 Rivard Street)
Grand Rapids—Leonard Division of Kelvinator Corporation
(Clyde Park Avenue)
Jackson—Reynolds Spring Company
(North East Avenue)
St. Joseph—Upton Machine Company.
Wayne—Deceleco, Inc.

Minnesota

Minneapolis—B. J. Carney & Company
(100 North Seventh Street)
Electric Machinery Manufacturing Company
(1331 N. E. Tyler Street)
National Pole & Treating Company
(1100 Builders Exchange Building)
The Valentine-Clark Company
(Box 1797)
Waters-Genter Company
(213 N. Second)
St. Paul—Bohn Refrigerator Company
(1350 University Avenue)
Seeger Refrigerator Company
(Arcade-Wells-Whitehall Streets)

Missouri

Centralia—Chance Company.
St. Louis—Century Electric Company
(1827 Pine Street)
Electrol, Incorporated
(170 Dorcas Street)
Emerson Electric Manufacturing Company
(2018 Washington Avenue)
The Edwin F. Guth Company
(2615 Washington Avenue)
Heine Boiler Company
(5319 Shreve Avenue)
James R. Kearney Corporation
(4334 Clayton Avenue)
W. N. Matthews Corporation
(3722 Forest Park)
Moloney Electric Company
(5390 Kingshighway, N. W.)
St. Louis Malleable Casting Company
(7701 N. Conduit Avenue)
Wagner Electric Corporation
(6400 Plymouth Avenue)

Nebraska

Omaha—Clark Electric Water Heater
(Division of McGraw Electric Company. 13th and Capital Avenue)

New Hampshire

Laconia—Laconia Car Company.

New Jersey

Garwood—Diamond Expansion Bolt Company.
Gloucester City—Welsbach Company.
Harrison—Driver-Harris Company; Edison Lamp Works of General Electric Company.
Hoboken—Cooper-Hewitt Electric Company
(410 Eighth Street)
Newark—American Transformer Company
(178-182 Emmet Street)
Baker and Company, Inc.
(54 Austin Street)
Weston Electrical Instrument Corporation
(614 Frelinghuysen Avenue)
Orange—Thomas A. Edison, Inc.
(Special Sales Department)
Edison Storage Battery Company
Passaic—The Okonite Company.
(501 Fifth Avenue, New York, N. Y.)
The Okonite-Callender Cable Co., Inc.
(501 Fifth Avenue, New York, N. Y.)
Trenton—Circle F Manufacturing Company; De Laval Steam Turbine Company; Imperial Porcelain Works.

New York

Albany—Hynes & Cox Electric Corporation
(406 N. Pearl Street)
Beacon—The Green Fuel Economizer Company.
Buffalo—Handi Appliance Corporation
(33 Chandler Street)
Savory, Inc.
(90 Alabama Street)
Corning—Corning Glass Works.
Johnson City—Central Flatiron Manufacturing Company.
LeRoy—Lapp Insulator Company, Inc.
Lima—The Porcelain Insulator Corporation.
Mount Vernon—Ward Motor Vehicle Company
(South Fulton Avenue)

(Class D Members Continued)

Brooklyn—Gleason-Tiebout Glass Company
(99 Commercial Street)
Lackner Products Corporation
(135 Luqueer Street)
Metropolitan Device Corporation
(1250 Atlantic Avenue)
Albert Whale Company, Inc.
(Metropolitan and Morgan Avenues)

Manhattan—Alberne Stone Company
(153 West 23rd Street)
American Brown Boveri Electric Corporation
(Graybar Building, 420 Lexington Avenue)
American Flexible Shaft Manufacturing Corporation
(331 Madison Avenue)
The Babcock & Wilcox Company
(85 Liberty Street)
Bakelite Corporation
(247 Park Avenue)
Bishop Wire & Cable Corporation
(420 East 25th Street)
Borne Scrymser Company
(Whitehall Building, 17 Battery Place)
Burndy Engineering Company, Inc.
(10 East 43rd Street)
Claude Neon Lights, Inc.
(50 East 42nd Street)
Combustion Engineering Corporation
(200 Madison Avenue)
Consolidated Ashcroft Hancock Company, Inc.
(100 East 42nd Street)
Curtin-Howe Corporation
(11 Park Place)
Davis Emergency Equipment Company, Inc.
(67 Wall Street)
De Jur Products Company
(199 Lafayette Street)
The De Laval Separator Company
(165 Broadway)
Dossert & Company
(242 West 41st Street)
Bubilier Condenser Corporation
(10 East 43rd Street)
The Engineer Company
(17 Battery Place)
The Engineering Products Corporation, Inc.
(25 Church Street)
Foster Wheeler Corporation
(165 Broadway)
Furnace Engineering Company, Inc.
(200 Madison Avenue)
General Office Equipment Corporation
(342 Madison Avenue)
Gould Storage Battery Company, Inc.
(250 Park Avenue)
Graybar Electric Company, Inc.
(Lexington Avenue and 43rd Street)
A. H. Grebe & Company, Inc.
(109 West 57th Street)
The Griscom-Russell Company
(285 Madison Avenue)
Habirshaw Cable & Wire Corporation
(233 Broadway)
Holophane Company, Inc.
(342 Madison Avenue)
Ingersoll Rand Company (A. S. Cameron Steam Pump Works)
(11 Broadway)
The International Nickel Company
(67 Wall Street)
Johns-Manville Corporation
(Madison Avenue and 41st Street)
Kerite Insulated Wire & Cable Company
(30 Church Street)
Walter Kidde & Company, Inc.
(140 Cedar Street)
Lightolier Company
(569 Broadway)
Mica Insulator Company
(200 Varick Street)
National Electric Products Corporation
(233 Broadway)
Noma Electric Corporation
(340 Hudson Street)
O. B. Electric Truck, Inc.
(578-82 Washington Street)
Otis Elevator Company
(260 11th Avenue)
Peerless Insulated Wire & Cable Company
(30 Church Street)
The Permutit Company
(440 4th Avenue)
The Portable Light Company, Inc.
(12 Warren Street)
Radio Corporation of America
(233 Broadway)
The Rawlplug Company, Inc.
(66 West Broadway)
Research Corporation
(25 West 43rd Street)
Safety Cable Company
(420 Lexington Avenue)
Serelco, Inc.
(420 Lexington Avenue)
Smoot Engineering Corporation
(136 Liberty Street)
Standard Oil Company of New Jersey
(26 Broadway)
The Superheater Company
(17 East 42nd Street)
Tabulating Machine Company
(50 Broad Street)
The R. Thomas & Sons Company
(30 Church Street)

(Class D Members Continued)

Seth Thomas Clock Company
(19 West 44th Street)
Vacuum Oil Company
(61 Broadway)
Waterbury Cable Service, Inc.
(342 Madison Avenue)
Western Electric Company, Inc.
(195 Broadway)
Westinghouse Commercial Investment Company
(150 Broadway)
Westinghouse Electric International Company
(150 Broadway)
Westinghouse Lamp Company
(150 Broadway)
Worthington Pump & Machinery Corporation
(2 Park Avenue)
York Insulated Wire Works of General Electric Company
(1737 Broadway)
Long Island City—The Frink Corporation
(23-10 Bridge Plaza, South)
Irving Iron Works Company
(Third and Creek Streets)
Memco Engineering & Manufacturing Company, Inc.
(381 Hamilton Street)
Morganite Brush Company, Inc.
(3302-3320 Anable Avenue)
Niagara Falls—Globar Corporation (P. O. 618)
Orchard Park—Park Metalware Company, Inc.
(Thorne Avenue and Bank Street)
Port Jervis—Gillinder Brothers.
Poughkeepsie—Hoe Corporation.
Rochester—North East Electric Company
(379 Lyell Avenue)
Rainbow Appliance Corporation
(11-27 Hand Street)
Robeson-Rochester Corporation
(176 Anderson Avenue)
Samson Cutlery Company
(10 Jones Street)
Rome—Rome Wire Company.
Schenectady—General Electric Company; International General Electric Company, Inc.
Solvay—Pass & Seymour, Inc.
Syracuse—Archbold-Brady Company.
Utica—American LaFrance and Foamite Ind., Inc.; Savage Arms Corporation.
(100 East 42nd St., New York, N. Y.)
Wellsville—The Air Preheater Corporation.

Ohio

Canton—Nelson & Kuemmerling
(718 Brant Building)
Superior Iceless Refrigerator, Inc.
The Superior Switchboard & Devices Company
(420 Schroyer Avenue)
The Union Metal Manufacturing Company
(Maple Avenue)
The United Electric Company
(Eighth Street, N. E.)
Cincinnati—Logan County Coal Corporation
(2111 Union Central Building)
The Lunkenheimer Company
Cleveland—The Apex Electrical Manufacturing Company.

Philadelphia—The Allen-Sherman-Hoff Company
(225 South 15th Street)
American Engineering Company
Andale Company
(1600 Arch Street)
Atwater Kent Manufacturing Company
(4700 Wissahickson Avenue)
R. H. Beaumont Company
(319 Arch Street)
James G. Biddle
(1211-13 Arch Street)
Decorative Lamp & Shade Company
(1217-33 Spring Garden Street)
J. Struthers Dunn
(1130 Race Street)
Electric Power Equipment Corporation
(412-420 North 16th Street)
Electric Service Supplies Company
(17th and Cambria Streets)
The Electric Storage Battery Company
(19th Street and Allegheny Avenue)
Franklin Development Company, Inc.
(108 Walnut Street)
Hall Electric Heating Company, Inc.
(1429 Walnut Street)
I.-T.-E. Circuit Breaker Company
(501 North 19th Street)
Kingsbury Machine Works, Inc.
(4320 Tackawanna Street, Frankford)
Leeds & Northrup Company
(4901 Stenton Avenue)
I. P. Morris & De La Vergne, Inc.
(Richmond and Norris Streets)
Murlin Manufacturing Company
(5420 Paschall Avenue)
Philadelphia Electrical & Manufacturing Company
(1228 North 31st Street)
Philadelphia Storage Battery Company
(Ontario and C Streets)
Roberts & Mander Stove Company
(11th Street and Washington Avenue)
The Sharples Specialty Company
(23rd and Westmoreland Streets)
C. H. Wheeler Manufacturing Company
(Lehigh and Sedgley Avenues)
Wright Appliance Company
(2109 Market Street)
Pittsburgh—Aluminum Company of America
(2400 Oliver Building)
Blaw-Knox Company
(P. O. Box 915)
Gainaday Electric Company
(P. O. Box 1236)
Hubbard & Company
(Granite Building)
Ladd Water Tube Boiler Company
(1606 First National Bank Building)
Mine Safety Appliances Company
(Braddock, Thomas and Meade)
National Valve & Manufacturing Company
(Arsenal Station)
R. D. Nuttall Company
(McCandless Avenue and Harrison Street)
Oliver Iron & Steel Corporation
(South Tenth and Muriel Streets)
The Phoenix Glass Company
(230 Fifth Avenue, New York, N. Y.)
Pittsburgh Reflector Company
(Third Avenue & Ross Street)
Riter-Conley Company
(318 Oliver Building)
Seyler Manufacturing Company
(Sharpsburg Post Office)
Standard Underground Cable Company
(S. W. Corner 17th and Pike Streets)
P. Wall Manufacturing Supply Company
(30 Church Street, New York, N. Y.)
Pottstown—Automatic Electric Heater Company.
Wilkes-Barre—Hazard Insulated Wire Works
(Division of The Okonite Company)

Rhode Island

Pawtucket—Tubular Woven Fabric Company
Providence—American Electrical Works

Texas

Orange—Texas Cresoting Company

Virginia

Newport News—Newport News Shipbuilding & Dry Dock Company
Waynesboro—W. J. Loth Stove Company, Inc.

Washington

Spokane—Electro Kold Corporation
(S. 151 Post Street)

West Virginia

Follansbee—The Jefferson Glass Company
Huntington—The Armstrong Electric and Manufacturing Corporation
Kenova—Champion Switch Company; Jeffery-Dewitt Insulator Company

(Class D Members Continued)

Wisconsin

Beaver Dam—Malleable Iron Range Company
Clintonville—Four Wheel Drive Auto Company
Madison—Hankscraft Company
(121 North Dickinson Street)
Milwaukee—Allen-Bradley Company
(494 Reed Street)
Allis-Chalmers Manufacturing Company
The Cutler-Hammer Manufacturing Company
(P. O. 1564)
A. J. Lindemann & Hoverson Company
(1st and Cleveland Avenues)
The MacGillis & Gibbs Company
(1201 Wells Building)
Nordberg Manufacturing Company
South Milwaukee—Line Material Company
(Railroad Tr. and Michigan Avenue)
Two Rivers—Metal Ware Corporation

(Class F, Associate Companies, and Class H, Foreign Members, will appear next month)

A young salesman was seen to turn away from a prospective buyer of an electric washing machine, a disgusted look on his face.

"She doesn't want an electric washing machine," the young man said. "I explained just how to operate it, turned on the current, and showed her how it works, and finally she pointed to the hole in the bottom and asked:

"What is that for?"

"To let the water out," I said.

"Oh, then it doesn't wash by electricity, does it, you have to use water?"—Exchange.

Twice as Strong

(Continued from page 67)

duals, so marked that they were noticed generally. The morale and *esprit de corps* has been improved, and unquestionably our employees are more 'customer minded' and are putting more spirit and enthusiasm in their customer contacts."

The effect of this attitude was shown in the reaction of customers. With surprising frequency they voluntarily reported instances of unusual courtesy shown them by employees, and otherwise demonstrated their increased friendliness to the company.

The details of the plan employed by this company will undoubtedly interest others.

List of Member Companies

It has been customary in the past to publish annually in booklet form a list of member companies of the National Electric Light Association. It is planned henceforth, and beginning with this issue, to publish this list once each year in the N. E. L. A. Bulletin instead of in the booklet form. A sufficient number of extra copies of the Bulletin will be printed to supply any reasonable demand for the list.

Correction

The following table of District Brightness Factors, inadvertently omitted, should appear on page 64 of the Electrical Advertising Committee Serial Report, "Symposium on Electrical Advertising" (N. E. L. A. Publication No. 289-9).

Description of District	Factor
Extremely bright centers such as Times Square, New York City, and State Street, Chicago	1
Very bright centers in large cities, such as Cadillac Square, Detroit; Playhouse Square, Cleveland...........	2
Bright squares in large cities.........	3
White Ways in large cities. Squares in small cities	4
Business districts (not White Way) in large cities. White Ways in smaller cities	5
Business districts in small cities. Outlying districts in large cities........	6
Centers of small towns. Outlying districts of small cities...............	7
Dark outlying districts with an occasional lighted display	8
Lighted highways, no display lighting.	9
A single isolated display, no street lighting or store windows...........	10

The report had been mailed to member companies and committee members before the omission was discovered. A correction slip has been mailed to the same list.

OFFICERS—DIVISIONS—SECTIONS—BUREAUS—COMMITTEES—CONVENTIONS—MEETINGS—NEW MEMBERS

NATIONAL EXECUTIVE COMMITTEE

Officers

President, P. S. Arkwright
Georgia Power Co., Atlanta, Ga.

Vice-President, M. S. Sloan
The New York Edison Co., New York, N. Y.

Vice-President, W. A. Jones
Henry L. Doherty & Co., New York, N. Y.

Vice-President, J. F. Owens
Oklahoma Gas & Electric Co., Oklahoma City, Okla.

Vice-President, Marshall E. Sampsell
Central Illinois Public Service Co., Chicago, Ill.

Treasurer, P. S. Young
Public Service Electric & Gas Co., Newark, N. J.

Managing Director, Paul S. Clapp
National Electric Light Association, New York, N. Y.

Secretary, A. Jackson Marshall
National Electric Light Association, New York, N. Y.

Members-at-Large

(*Term expiring June 30th,* 1929)

H. T. Sands, *Ex Officio,* Electric Bond & Share Co., New York, N. Y.

C. L. Collens, Reliance Electric & Manufacturing Co., Cleveland, Ohio

G. E. Cullinan, Graybar Electric Co., Inc., New York, N. Y.

E. W. Lloyd, Commonwealth Edison Co., Chicago, Ill.

Harry Reid, National Electric Power Co., New York, N. Y.

James R. Strong, Tucker Electrical Construction Co., New York, N. Y.

(*Term expiring June 30th,* 1930)

D. C. Barnes, Stone & Webster, Inc., Boston, Mass.

H. P. Liversidge, The Philadelphia Electric Co., Philadelphia, Pa.

Gerard Swope, General Electric Co., New York, N. Y.

(*Term expiring June 30th,* 1931)

John P. Coghlan, Pacific Gas & Electric Co., San Francisco, Cal.

H. M. Edwards, The New York Edison Co., New York, N. Y.

E. M. Herr, Westinghouse Electric & Manufacturing Co., New York, N. Y.

National Section Chairmen

Accounting—John F. Ford, The Philadelphia Electric Co., Philadelphia, Pa.

Commercial—Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

Engineering—E. C. Stone, Duquesne Light Co., Pittsburgh, Pa.

Public Relations—J. F. Owens, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

Geographic Division Presidents

Canadian—P. S. Gregory, Shawinigan Water & Power Co., Montreal, Canada

Eastern—F. R. Phillips, Duquesne Light Co., Pittsburgh, Pa.

East Central—C. S. MacCalla, Pennsylvania-Ohio Power & Light Co., Youngstown, Ohio

Great Lakes—J. E. Johnson, Illinois Power & Light Corp., Chicago, Ill.

Middle West—Ralph T. Smalley, Kansas Electric Power Co., Lawrence, Kan.

New England—Irvin W. Day, The Connecticut Light & Power Co., Waterbury, Conn.

North Central—L. M. Pharis, Minnesota Power & Light Co., Duluth, Minn.

Northwest—R. M. Boykin, Puget Sound Power & Light Co., Seattle, Wash.

Pacific Coast—Paul M. Downing, Pacific Gas & Electric Co., San Francisco, Cal.

Rocky Mountain—Clare N. Stannard, Public Service Co. of Colorado, Denver, Colo.

Southeastern—C. A. Collier, Georgia Power Co., Atlanta, Ga.

Southwestern—J. G. Holtzclaw, Gulf States Utilities Co., Beaumont, Tex.

PUBLIC POLICY COMMITTEE

Chairman, R. H. Ballard, Southern California Edison Co., Los Angeles, Cal.

Vice-Chairman, W. W. Freeman, Columbia Gas & Electric Corp., New York, N. Y.

P. S. Arkwright, Georgia Power Co., Atlanta, Ga.

Henry G. Bradlee, Stone & Webster, Inc., Boston, Mass.

N. F. Brady, The New York Edison Co., New York, N. Y.

B. C. Cobb, Allied Power & Light Corp., New York, N. Y.

Frank L. Dame, The North America Co., New York, N. Y.

J. E. Davidson, Nebraska Power Co., Omaha, Neb.

Henry L. Doherty, Henry L. Doherty & Co., New York, N. Y.

Alex Dow, The Detroit Edison Co., Detroit, Mich.

Charles L. Edgar, The Edison Electric Illuminating Co., Boston, Mass.

Halford Erickson, Byllesby Engineering & Management Corp., Chicago, Ill.

P. G. Gossler, Columbia Gas & Electric Corp., New York, N. Y.

A. R. Graustein, International Paper Co., New York, N. Y.

Franklin T. Griffith, Portland Electric Power Co., Portland, Ore.

C. E. Groesbeck, Electric Bond & Share Co., New York, N. Y.

Edwin Gruhl, The North American Co., New York, N. Y.

A. F. Hockenbeamer, Pacific Gas & Electric Co., San Francisco, Cal.

Martin J. Insull, Middle West Utilities Co., Chicago, Ill.

Samuel Insull, Commonwealth Edison Co., Chicago, Ill.

Walter H. Johnson, The Philadelphia Electric Co., Philadelphia, Pa.

W. A. Jones, Henry L. Doherty & Co., New York, N. Y.

John W. Lieb, The New York Edison Co., New York, N. Y.

Thomas W. Martin, Alabama Power Co., Birmingham, Ala.

Thomas N. McCarter, Public Service Electric & Gas Co., Newark, N. J.

John B. Miller, Southern California Edison Co., Los Angeles, Cal.

Sidney Z. Mitchell, Electric Bond & Share Co., New York, N. Y.

Thomas E. Murray, The New York Edison Co., New York, N. Y.

J. J. O'Brien, H. M. Byllesby & Co., Chicago, Ill.

J. F. Owens, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

R. F. Pack, Northern States Power Co., Minneapolis, Minn.

A. W. Robertson, Westinghouse Electric & Manufacturing Co., New York, N. Y.

Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

H. T. Sands, Electric Bond & Share Co., New York, N. Y.

Paul A. Schoellkopf, The Niagara Falls Power Co., Niagara Falls, N. Y.

M. S. Sloan, The New York Edison Co., New York, N. Y.

Frank W. Smith, The United Electric Light & Power Co., New York, N. Y.

R. P. Stevens, Allied Power & Light Corp., New York, N. Y.

Frank M. Tait, The Dayton Power & Light Co., Dayton, Ohio.

A. W. Thompson, The United Gas Improvement Co., Philadelphia, Pa.

George N. Tidd, American Gas & Electric Co., New York, N. Y.

Herbert A. Wagner, Consolidated Gas, Electric Light & Power Co., Baltimore, Md.

Owen D. Young, General Electric Co., New York, N. Y.

Public Relations National Section Representatives

John F. Gilchrist, Commonwealth Edison Co., Chicago, Ill.

T. A. Kenney, Allied Power & Light Corp., New York, N. Y.

Guy W. Talbot, Pacific Power & Light Co., Portland, Ore.

GEOGRAPHIC DIVISIONS STATE ASSOCIATIONS

CANADIAN DIVISION

(*Entire Dominion of Canada*)

Canadian Electrical Association

President, P. S. Gregory, The Shawinigan Water & Power Co., Montreal, Can.; *Secretary,* H. M. Lyster, Room 712, Power Bldg., Montreal, Can.

(*This Division Has No State [Provincial] Section*)

*EASTERN DIVISION

(*New Jersey, New York, Pennsylvania*)

President, F. R. Phillips, Duquesne Light Co., Pittsburgh, Pa.; *Managing Director,* A. B. Millar, Telegraph Bldg., Harrisburg, Pa.

Empire State Gas and Electric Association

President, Charles S. Ruffner, Mohawk-Hudson Power Corp., Albany, N. Y.; *Secretary,* Charles H. B. Chapin, 5618 Grand Central Terminal Bldg., New York, N. Y.

New Jersey Electric Association

President, C. H. Howell, Atlantic City Electric Co., Atlantic City, N. J.; *Secretary,* S. F. Delany, Atlantic City Electric Co., Atlantic City, N. J.

Pennsylvania Electric Association

President, F. R. Phillips, Duquesne Light Co., Pittsburgh, Pa.; *Managing Director,* A. B. Millar, Telegraph Bldg., Harrisburg, Pa.

EAST CENTRAL DIVISION

(*Kentucky, Ohio, West Virginia*)

President, C. S. MacCalla, Pennsylvania-Ohio Power & Light Co., Youngstown, Ohio; *Secretary-Treasurer,* D. L. Gaskill, 603½ Broadway, Greenville, Ohio.

Kentucky Association of Public Utilities

President, Samuel Riddle, Louisville Railway Co., Louisville, Ky.; *Secretary,* E. F. Kelly, Louisville Railway Co., Louisville, Ky.

Public Utilities Association of West Virginia

President, A. C. Spurr, Wheeling Traction Co., Wheeling, W. Va.; *Secretary,* A. Bliss McCrum, Box 1483, Charleston, W. Va.

GREAT LAKES DIVISION

(*Illinois, Indiana, Michigan, Wisconsin*)

President, J. E. Johnson, Illinois Power & Light Corp., Chicago, Ill.; *Secretary,* Tom C. Polk, 910 Marquette Bldg., Chicago, Ill.

Illinois State Electric Association

President, Julius L. Hecht, Public Service Co. of Northern Illinois, Chicago, Ill.; *Secretary-Treasurer,* Tom C. Polk, 910 Marquette Bldg., Chicago, Ill.

Indiana Electric Light Association

President, Norman A. Perry, Indianapolis Power & Light Co., Indianapolis, Ind.; *Secretary-Treasurer,* William Stokes, 1548 Consolidated Bldg., Indianapolis, Ind.

Michigan Electric Light Association Section

President, Howard Pett, Consumers Power Co., Jackson, Mich.; *Secretary-Treasurer,* Herbert Sylvester, The Detroit Edison Co., Ann Arbor, Mich.

Wisconsin Utilities Association

President, C. R. Phenicie, Wisconsin Public Service Corp., Green Bay, Wis.; *Executive Secretary,* John N. Cadby, Room 203, University Bldg., 432 Broadway, Milwaukee, Wis.

*MIDDLE ATLANTIC DIVISION

(*To Consist of Delaware, District of Columbia, Maryland, Virginia*)

Maryland Utilities Association

President, H. T. Connolly, Washington, Baltimore & Annapolis Electric Railroad Company, Baltimore, Md.; *Secretary,* D. E. Kinnear, United Railways & Electric Company, Baltimore, Md.

Public Utilities Association of Virginia

President, A. W. Higgins, Virginia Public Service Co., Charlottesville, Va.; *Secretary,* A. B. Tunis, 301 East Grace Street, Richmond, Va.

MIDDLE WEST DIVISION

(Iowa, Kansas, Missouri, Nebraska)

President, RALPH T. SMALLEY, Kansas Electric Power Co., Lawrence, Kan.; *Managing Director*, THORNE BROWNE, 1527 Sharp Bldg., Lincoln, Neb.

Iowa Section

President, C. S. MACY, Iowa Power & Light Co., Adel, Iowa; *Secretary-Treasurer*, H. E. WEEKS, Tri-City Railway & Light Co., Davenport, Iowa.

Kansas Section

President, FRANK M. STONE, Kansas Utilities Co., Fort Scott, Kan.; *Secretary*, H. LEE JONES, 820 Kansas Avenue, Topeka, Kan.

Missouri Association of Public Utilities

President, A. E. REYNOLDS, Springfield Gas & Electric Co., Springfield, Mo.; *Secretary-Treasurer*, F. D. BEARDSLEE, 315 North Twelfth Street, St. Louis, Mo.

Nebraska Section

President, C. W. AMIDON, Central Power Co., Grand Island, Neb.; *Managing Director*, THORNE BROWNE, 1527 Sharp Bldg., Lincoln, Neb.

NEW ENGLAND DIVISION

(Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont)

President, IRVIN W. DAY, The Connecticut Light & Power Co., Waterbury, Conn.; *Secretary*, MISS O. A. BURSIEL, Room 1113 Statler Bldg., 20 Providence Street, Boston, Mass.

(This Division Has No State Sections)

NORTH CENTRAL DIVISION

(Minnesota, North Dakota, South Dakota)

North Central Electric Association

President, L. M. PHARIS, Minnesota Power & Light Co., Duluth, Minn.; *Secretary*, JOHN W. LAPHAM, 803-804 Plymouth Bldg., Minneapolis, Minn.

(This Division Has No State Sections)

NORTHWEST DIVISION

(Alaska, Idaho, Montana, Oregon, Utah, Washington)

Northwest Electric Light and Power Association

President, R. M. BOYKIN, Pudget Sound Power & Light Co., Seattle, Wash.; *Secretary*, BERKELEY SNOW, Room 1206, Spaulding Bldg., Portland, Ore.

(This Division Has No State Sections)

PACIFIC COAST DIVISION

(Arizona, California, Hawaii, Nevada, Philippine Islands)

Pacific Coast Electrical Association

President, PAUL M. DOWNING, Pacific Gas & Electric Co., San Francisco, Cal.; *Secretary*, SAMUEL H. TAYLOR, Suite 729-730, 447 Sutter Street, San Francisco, Cal.

Arizona Utilities Association

President, M. A. POOLER, Tucson Gas, Electric Light & Power Co., Tucson, Ariz.; *Secretary*, L. C. MCCULLOUGH, 134 South Central Avenue, Phoenix, Ariz.

ROCKY MOUNTAIN DIVISION

(Colorado, New Mexico, Wyoming)

President, CLARE N. STANNARD, Public Service Co. of Colorado, Denver, Colo.; *Secretary*, O. A. WELLER, Public Service Co. of Colorado, Denver, Colo.

The Colorado Utilities Association

President, V. L. BOARD, Public Service Co. of Colo., Denver, Colo.; *Secretary*, O. A. WELLER, Public Service Co. of Colo., Denver, Colo.

New Mexico Utilities Association

President, W. W. NIELSEN, New Mexico Power Co., Santa Fe, N. M.; *Secretary-Treasurer*, BERNARD L. WILES, Albuquerque Gas & Electric Co., Albuquerque, N. M.

Wyoming Utilities Association

President, W. D. JOHNSTONE, Mountain States Power Co., Casper, Wyo.; *Secretary*, F. A. PROBST, Mountain States Telephone & Telegraph Co., Casper, Wyo.

SOUTHEASTERN DIVISION

(Alabama, Cuba, Florida, Georgia, North Carolina, South Carolina, Tennessee, Porto Rico)

President, C. A. COLLIER, Georgia Power Co., Atlanta, Ga.; *Secretary*, C. M. KILIAN, 207-8 Bona Allen Bldg., Atlanta, Ga.

SOUTHWESTERN DIVISION

(Arkansas, Louisiana, Mississippi, Oklahoma, Texas)

President, J. G. HOLTZCLAW, Gulf States Utilities Co., Beaumont, Tex.; *Secretary*, S. J. BALLINGER, San Antonio Public Service Co., San Antonio, Tex.

Arkansas Utilities Association

President, W. E. BANN, Southwestern Gas & Electric Co., Texarkana, Tex.; *Secretary*, R. I. BROWN, Arkansas Central Power Co., Little Rock, Ark.

Mississippi Electric League

President, A. H. JONES, Jones-Johnson Co., McComb, Miss.; *Secretary*, A. R. RIDDICK, A. G. Riddick, Inc., Jackson, Miss.

Oklahoma Utilities Association

President, L. W. SCHERER, United Telephone Corp., Watonga, Okla.; *Secretary*, EDWARD F. MCKAY, 1020 Petroleum Bldg., Oklahoma City, Okla.

Southwestern Public Service Association

President, W. H. BURKE, Stone & Webster, Inc., Houston, Tex.; *Secretary*, E. N. WILLIS, 403 Slaughter Bldg., Dallas, Tex.

***Note: This Division is in Process of Formation.**

SECTIONS, BUREAUS AND COMMITTEES

Chairmen's names only listed here

SPECIAL NATIONAL COMMITTEES

Advertising Committee—FRANK LEROY BLANCHARD, Henry L. Doherty & Co., New York, N. Y.

Charles A. Coffin Prize Committee—P. S. ARKWRIGHT, Georgia Power Co., Atlanta, Ga.

Codes and Standards Committee—IRVIN W. DAY, The Connecticut Light & Power Co., Waterbury, Conn.

Constitution and By-Laws Committee—R. F. PACK, Northern States Power Co., Minneapolis, Minn.

Electrification of Steam Railroads Committee—BRITTON I. BUDD, Public Service Co. of Northern Illinois, Chicago, Ill.

Exhibition Committee—E. W. GOLDSCHMIDT, Wagner Electric Corp., New York, N. Y.

Finance Committee—SIDNEY Z. MITCHELL, Electric Bond & Share Co., New York, N. Y.

Lamp Committee—FRANK W. SMITH, The United Electric Light & Power Co., New York, N. Y.

Prize Awards Committee—W. H. ONKEN, JR., *Electrical World*, New York, N. Y.

Public Policy Committee—R. H. BALLARD, Southern California Edison Co., Los Angeles, Cal.

Rate Research Committee—L. R. NASH, Stone & Webster, Inc., Boston, Mass.

Water Power Development Committee—PAUL A. SCHOELLKOPF, The Niagara Falls Power Co., Niagara Falls, N. Y.

Wiring Policy Committee—J. E. DAVIDSON, Nebraska Power Co., Omaha, Neb.

GENERAL NATIONAL COMMITTEES

***Civic Development Committee**—JOHN B. REYNOLDS, Middle West Utilities Co., Chicago, Ill.

***Educational Committee**—FRED R. JENKINS, Commonwealth Edison Co., Chicago, Ill.

***Insurance Committee**—W. H. SAWYER, Allied Power & Light Co., New York, N. Y.

***Membership Committee**—HOWARD K. MOHR, The Philadelphia Electric Co., Philadelphia, Pa.

***Rural Electric Service Committee**—CHARLES F. STUART, Northern States Power Co., Minneapolis, Minn.

ACCOUNTING NATIONAL SECTION

***Section's Executive Committee**—J. F. FORD, The Philadelphia Electric Co., Philadelphia, Pa.

***Classification of Accounts Committee**—H. C. HASBROUCK, H. C. Hopson & Co., New York, N. Y.

Corporate Finance Committee—O. E. MCCORMICK, Middle West Utilities Co., Chicago, Ill.

***Customers' Records Committee** — DOUGLAS BROWN, New York & Queens Electric Light & Power Co., Long Island City, N. Y.

***Fixed Capital Committee**—J. A. ROCKWOOD, Portland Electric Power Co., Portland, Ore.

***General Records Committee**—K. B. CRUMB, American Gas & Electric Co., New York, N. Y.

***Purchasing and Storeroom Committee**—W. G. YOUNG, New York & Queens Electric Light & Power Co., Long Island City, N. Y.

***Statistics Committee**—HARRY A. SNOW, The Detroit Edison Co., Detroit, Mich.

COMMERCIAL NATIONAL SECTION

***Section's Executive Committee**—MARSHALL E. SAMPSELL, Central Illinois Public Service Co., Chicago, Ill.

***Commercial and Industrial Power and Heating Bureau**—V. M. F. TALLMAN, Charles H. Tenney & Co., Boston, Mass.

Commercial Cooking Committee—O. WILHELMY, The Union Gas & Electric Co., Cincinnati, Ohio.

Electric Truck Committee — GUY W. FALLER, Public Service Co. of Colorado, Denver, Colo.

Central Power Committee—H. C. THUERK, Erie Lighting Co., Erie, Pa.

Industrial Heating Committee—J. L. FADEN, The Edison Electric Illuminating Co., Boston, Mass.

***Lighting Bureau**—T. O. KENNEDY, The Ohio Public Service Co., Cleveland, Ohio.

Commercial and Industrial Lighting Committee—J. DANIELS, The Edison Electric Illuminating Co., Boston, Mass.

Electrical Advertising Committee—C. J. EATON, Middle West Utilities Co., Chicago, Ill.

Home Lighting Committee—W. T. BLACKWELL, Public Service Electric & Gas Co., Newark, N. J.

Street Lighting Committee—R. J. MALCOMSON, Public Service Co. of Northern Illinois, Chicago, Ill.

***Merchandising Bureau**—FRANK D. PEMBLETON, Public Service Electric & Gas Co., Newark, N. J.

Domestic Electric Range Committee—F. A. COUPAL, Buffalo, Niagara & Eastern Power Corp., Buffalo, N. Y.

Merchandise Sales Committee—C. L. HAROLD, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

Refrigeration Committee—C. L. DUNN, The Ohio Public Service Co., Cleveland, Ohio.

Water Heating Committee—NORMAN T. WILCOX, Stone & Webster, Inc., Boston, Mass.

***Customer Relations Committee**—H. T. EAST, Public Service Co. of Northern Illinois, Chicago, Ill.

Promotional Rates Committee—E. W. LLOYD, Commonwealth Edison Co., Chicago, Ill.

***Wiring Sales Committee**—A. P. GOOD, Commonwealth Edison Co., Chicago, Ill.

ENGINEERING NATIONAL SECTION

***Section's Executive Committee**—E. C. STONE, Duquesne Light Co., Pittsburgh, Pa.

***Accident Prevention Committee**—C. R. BEARDSLEY, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

***Electrical Apparatus Committee**—J. A. JOHNSON, The Niagara Falls Power Co., Niagara Falls, N. Y.

Engineering Administration Committee—H. P. LIVERSIDGE, The Philadelphia Electric Co., Philadelphia, Pa.

***Hydraulic Power Committee**—BYRON E. WHITE, Utica Gas & Electric Co., Utica, N. Y.

***Inductive Coordination Committee**—H. L. WILLS, Georgia Power Co., Atlanta, Ga.

***Meter Committee**—E. E. HILL, The New York Edison Co., New York, N. Y.

***Overhead Systems Committee**—HAROLD COLE, The Detroit Edison Co., Detroit, Mich.

***Power System Engineering Committee**—L. W. W. MORROW, *Electrical World*, New York, N. Y.

***Prime Movers Committee**—E. B. RICKETTS, The New York Edison Co., New York, N. Y.

Special Engineering Research Committee—C. F. HIRSHFELD, The Detroit Edison Co, Detroit, Mich.

***Underground Systems Committee**—J. W. SYLVESTER, The Philadelphia Electric Co., Philadelphia, Pa.

PUBLIC RELATIONS NATIONAL SECTION

***Section's Executive Committee**—J. F. Owens, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

***Cooperation with Educational Institutions**—Carl D. Jackson, 36 West 44th Street, New York, N. Y.

***Customer Ownership**—W. H. Hodge, Byllesby Engineering & Management Corp., Chicago, Ill.

***Industrial Relations Committee**—Homer E. Niesz, Commonwealth Edison Co., Chicago, Ill.

***Information Bureau Organizations Committee**—T. A. Kenney, Allied Power & Light Corp., New York, N. Y.

Manufacturers' Advertising Committee—T. J. McManis, General Electric Co., Schenectady, N. Y.

***Public Speaking Committee**—W. S. Vivian, Middle West Utilities Co., Chicago, Ill.

***Relations with Financial Institutions Committee**—A. W. Robertson, Westinghouse Electric & Manufacturing Co., New York, N. Y.

***Women's Committee**—Miss Sophia Malicki, Middle West Utilities Co., Chicago, Ill.

***Provision is made for a representative from each Geographic Division.**

CONVENTIONS AND MEETINGS

Meeting of the Section, Bureaus and Committees of the National Electric Light Association are shown in roman type; those of other associations in italics

1929

February

1 *American Institute of Electrical Engineers, New York, N. Y.*

4 Women's Committee, Eastern Geographic Division, 10:00 a. m., N. E. L. A. Headquarters, New York, N. Y

5–6 Merchandising Bureau, Book-Cadillac Hotel, Detroit, Mich.

5–7 *Artistic Lighting Equipment Association, Cavalier Hotel, Virginia Beach, Va.*

6 *New York Electrical Society, New York, N. Y.*

6 Draft Tubes Subcommittee, Hydraulic Power Committee, N. E. L. A. Headquarters, New York, N. Y.

6–8 *Iowa Engineering Society, Des Moines, Iowa.*

7 Commercial Section, Eastern Geographic Division, Pittsburgh, Pa.

12–16 *Midwest Power Conference and Exhibition, Chicago, Ill.*

13–14 Accounting, Commercial, Engineering and Public Relations Sections, Southeastern Geographic Division, Jacksonville, Fla.

18–20 New Mexico Utilities Association, Franciscan Hotel, Albuquerque, N. M.

18–21 *American Institute of Mining and Metallurgical Engineers, New York, N. Y.*

20–27 *Own Your Home Exposition, Madison Square Garden, New York, N. Y.*

25–26 Commercial Section, North Central Geographic Division, Nicollet Hotel, Minneapolis, Minn.

25–26 Classification of Accounts Committee, Palmer House, Chicago, Ill.

25–26 Customers' Records Committee, Palmer House, Chicago, Ill.

25–26 Fixed Capital Committee, Palmer House, Chicago, Ill.

25–26 General Records Committee, Palmer House, Chicago, Ill.

25–26—Purchasing and Storeroom Committee, Palmer House, Chicago, Ill.

25–26 Statistics Committee, Palmer House, Chicago, Ill.

25–26 Corporate Finance Committee, Palmer House, Chicago, Ill.

25–26 Budget Committee, Palmer House, Chicago, Ill.

25 General Meeting and Luncheon, 12:30 p. m., Palmer House, Chicago, Ill.

26 Executive Committee, Accounting National Section, 2:00 p. m., Palmer House, Chicago, Ill.

26–27 Iowa Section, N.E.L.A., Operators Division, Sioux City, Iowa.

March

4–6 *American Railway Association, Division 4, Engineering Signal Section, Stevens Hotel, Chicago, Ill.*

5 Insurance Committee, N. E. L. A. Headquarters, 10:00 a. m., New York, N. Y.

6 Executive Committee, Public Relations National Section, 10:30 a. m., N. E. L. A. Headquarters, New York, N. Y.

6 *New York Electrical Society, New York, N. Y.*

7 National Executive Committee, 10:30 a. m., N. E. L. A. Headquarters, New York, N. Y.

8 *Board of Directors, Society for Electrical Development, New York, N. Y.*

11–12 Hydraulic Power Committee, Peabody Hotel, Memphis, Tenn.

11–12 Overhead Systems Committee, Peabody Hotel, Memphis, Tenn.

11–12 Power Systems Engineering Committee, Peabody Hotel, Memphis, Tenn.

11–12 Prime Movers Committee, Peabody Hotel, Memphis, Tenn.

12 Executive Commitee, Engineering National Section, Peabody Hotel, Memphis, Tenn.

12–13 Accident Prevention Committee, Peabody Hotel, Memphis, Tenn.

12–14 Oklahoma Utilities Association, Oklahoma City, Okla.

13–14 Electrical Apparatus Committee, Peabody Hotel, Memphis, Tenn.

13–14 Inductive Coordination Committee, Peabody Hotel, Memphis, Tenn.

13–14 Meter Committee, Peabody Hotel, Memphis, Tenn.

13–14—Underground Systems Committee, Peabody Hotel, Memphis, Tenn.

20–22 *American Institute of Electrical Engineers, Regional Meeting, Cincinnati, Ohio.*

20–22 Commercial National Section, Group Committee meetings, Edgewater Beach Hotel, Chicago, Ill.

21–23 *American Society of Mechanical Engineers, Knoxville, Tenn.*

April

3 *New York Electrical Society, New York, N. Y.*

4–13 *Home Complete Exposition, Indiana State Fair Grounds, Indianapolis, Ind.*

17–18 *National Warm Air Heating and Ventilating Association, Indianapolis, Ind.*

21–23 *American Society of Civil Engineers, Dallas, Texas.*

22–26 *American Welding Society, Engineering Societies Bldg., New York, N. Y.*

24–26 Middle West Geographic Division, Hotel Fontenelle, Omaha, Neb.

29–30 *Chamber of Commerce of the U. S. A., Washington, D. C.*

30 Southwestern Geographic Division, Hot Springs, Ark.

30 Arkansas Utilities Association, Hot Springs, Ark.

May

1–3—Southwestern Geographic Division, Hot Springs, Ark.

1–3 Arkansas Utilities Association, Hot Springs, Ark.

1–3 *Chamber of Commerce of the U. S. A., Washington, D. C.*

1–3 *Indiana Public Utilities Association, Hotel Gary, Gary, Ind.*

1–3 Indiana Electric Light Association, Hotel Gary, Gary, Ind.

1–3 *Indiana Gas Association, Hotel Gary, Gary, Ind.*

7–9 *American Institute of Electrical Engineers, Regional Meeting, Dallas, Texas.*

7–10 East Central Geographic Division, Brown Hotel, Louisville, Ky.

8–10 Southeastern Geographic Division, Asheville, N. C.

13–15 *American Society of Mechanical Engineers, Rochester, N. Y.*

13–16 *National Fire Protection Association, Memphis, Tenn.*

20–25 *National Electrical Manufacturers Association, The Homestead, Hot Springs, Va.*

27–31 *National Electrical Wholesalers Association, The Homestead, Hot Springs, Va.*

27–31 *General Federation of Women's Clubs, Swampscott, Mass.*

June

3–7 Annual Convention and Exhibition, NATIONAL ELECTRIC LIGHT ASSOCIATION, Municipal Auditorium, Atlantic City, N. J.

14 *Board of Directors, Society for Electrical Development, New York, N. Y.*

16–18 North Central Geographic Division, Breezy Point Summer Resort, Pequot, Minn.

18–21 *Society of Automotive Engineers, New York, N. Y.*

19–21 Canadian Geographic Division, Algonquin Hotel, St. Andrews-by-the-Sea, N. B.

19–22 Pacific Coast Geographic Division, Del Monte, Cal.

24–28 *American Society for Testing Material, Atlantic City, N. J.*

24–28 *American Institute of Electrical Engineers, Swampscott, Mass.*

26–29 Northwest Geographic Division, Seattle, Wash.

July

1–4 *American Society of Mechanical Engineers, Salt Lake City, Utah*

August

27–30 *National Association of Railroad and Utilities Commissioners, Glacier National Park Hotel, Glacier National Park, Mont.*

September

4–6 Pennsylvania Electric Association, Bedford Springs Hotel, Bedford Springs, Pa.

9–11 Rocky Mountain Geographic Division, Hotel Colorado, Glenwood Springs, Colo.

16–19 New England Geographic Division, Hotel Griswold, New London, Conn.

19–20 Empire State Gas and Electric Association, Saranac Inn, Saranac Lake, N. Y.

28–30 *American Electric Railway Association Convention and Exhibit, Atlantic City Auditorium, Atlantic City, N. J.*

30 *National Safety Council, Stevens Hotel, Chicago, Ill.*

October

1–4 *American Electric Railway Association Convention and Exhibit, Atlantic City Auditorium, Atlantic City, N. J.*

1–4 *National Safety Council, Stevens Hotel, Chicago, Ill.*

14–18 *American Gas Association, Atlantic City, N. J.*

NEW MEMBERS

Employees of Electric Light & Power Companies (Class B)

California, Riverside, The Southern Sierras Power Company
A. J. Scott

Colorado, Denver, Rocky Mountain Committee on Public Utility Information
George E. Lewis

Connecticut, Waterbury, Connecticut Light & Power Company
Miss Bessie M. Harris (Middletown, Conn.)

Georgia, Atlanta, Georgia Power Company
Phillip Peeples

Georgia, Atlanta, Utilities Information Committee of Georgia
Willard Cope

Iowa, Des Moines, Iowa Committee on Public Utility Information
Joe Carmichel

Massachusetts, Boston, The Edison Electric Illuminating Company of Boston
Henry B. Kane
Gaston E. Loubris (Wakefield, Mass.)

Massachusetts, Boston, New England Bureau of Public Service Information
Samuel T. MacQuarrie

New Jersey, Asbury Park, Jersey Central Power & Light Company
John G. Haulenbeek (Belmar, N. J.)

New York, Bronx, The Bronx Gas and Electric Company
Henry Allen Rosenquest

New York, New York, American Gas & Electric Company
Henry D. Freitag

New York, New York, Electric Bond and Share Company
K. C. Christiansen (Germantown, Sta., Philadelphia, Pa.)

New York, New York, The New York Edison Company
William J. Brown
John P. Donlon
James P. Geoghegan
Diedrich Heins
Louis Inman
Nelson Inman
Alfred T. Jetter (Long Island City)
Frederick Edison Mollmann (Valley Stream, L. I.)
Joseph A. Perretti (Brooklyn, N. Y.)
Edward Stanley Phelps (Rockville Centre)
Joseph E. A. Rose
E. A. Sauer
William J. Sullivan (Richmond Hill)
New York, Long Island City, New York & Queens Electric Light & Power Company
Elmer H. Braun (Flushing, N. Y.)
New York, Staten Island, St. George, Staten Island Edison Corporation
Frank D. Banghart (West New Brighton, Staten Island, N. Y.)
Oklahoma, Sand Springs, Oklahoma Power & Water Company
Samuel Edwin Wolff
Pennsylvania, Pittsburgh, West Penn Power Company
Michael D. Baker (Springdale, Penn.)
Virginia, Winchester, Northern Virginia Power Company
Miss Mary E. Carr (Hancock, Maryland)
Canada, Nova Scotia, Halifax, Nova Scotia Light & Power Company, Ltd.
J. J. Doolan, Esq.
Canada, Ontario, Ottawa, Gatineau Power Company
R. J. Brearley, Esq.

Reviews of Publications

(*Continued from page* 117)

table of depths of setting), back filling and tamping, pole setting and erection, crossarms, insulators, guys, anchors, conductors (with table of minimum sizes), conductor configuration, sags (with tables), conductor fastenings, lightning arresters, grounding, transformer installations and economical use and spacing of transformers (with charts and illustrative problems). These construction features state in general the minimum clearance and strength requirements that should be employed in the construction of rural lines and are based on the requirements contained in Part 2 of the revised National Electrical Safety Code.

Charts and problems are given dealing with the economical use and location of transformers. In preparing the charts and problems for this part of the report, consideration has been given to: Return and fixed charges on the investment, Transformer core losses, Primary and secondary copper losses, Estimated kilowatt hour consumption, and Voltage regulation.

The sag tables apply to hard and medium drawn bare copper in sizes from No. 8 to No. 2/0 and are given for heavy, medium and light loading districts as defined in the National Electrical Safety Code for spans of from 100 to 500 feet. Sag tables are also included for aluminum cable steel reinforced (ACSR) for sizes from No. 8 to No. 4/0 for heavy, medium and light loading districts and for spans of from 100 to 800 feet.

Crossing clearances are illustrated for various conditions encountered in the ordinary run of rural line construction.

This report is well illustrated and should be valuable to anyone having or contemplating construction of rural lines or extensions.—V. W. PALEN.

Low Tension Metering Installations. Serial Report, Meter Committee, Engineering National Section. N.E.L.A. publication No. 289-39; 4 pp. Price 15 cents; to members, 10 cents.

THIS report presents the modern trend of low tension metering installation practice. Various schemes are discussed, and their advantages and disadvantages are pointed out. Of particular interest are the suggested specifications for service-entrance meter cabinets.—E. K.

Progress in Generator Design and Practice. Serial Report, Prime Movers Committee, Engineering National Section. N.E.L.A. publication No. 289-37; 24 pp.; 38 illustrations. Price 45 cents; to members, 30 cents.

DURING the last few years, due largely to revolutionary advances in the art of steel welding and cutting by flame and arc, great changes have occurred in the mechanical construction of electric generators.

Concurrently, the demand for generators of greater capacity, due largely to the advancing practice of system interconnection and the requirement for higher quality and longer life, has resulted in the development of new practices in the electrical design, construction and application of generators.

This report is a concise, comprehensive digest of the present state and trend of the art, and is presented in the form of statements by four of the larger manufacturers.—E. K.

Power Station Chemistry. Serial Report, Prime Movers Committee, Engineering National Section. N.E.L.A. publication No. 289-28; 20 pp.; 9 illustrations. Price 40 cents; to members, 25 cents.

THIS, the initial report of the Chemists Subcommittee of the Prime Movers Committee, includes extensive bibliographies both on combustion chemistry and corrosion; a preliminary study of the fundamentals of lubrication chemistry, and a tentative standard method for quantitatively determining dissolved oxygen in boiler feed water supplies, raw water excepted.

The report on lubrication presents an initial laboratory study on the chemistry of turbine oil. The program aims to supply to the user answers to the following questions:

1. By what standard can oils be judged suitable for turbine use?

2. If turbine oils deteriorate during use, by what methods can the degree of deterioration be determined?

It is suggested that the basis for judgment of an oil is a chemical one, and test data are cited showing that the criterion for determining the condition of an oil in service should include weekly tests for sludge, water, emulsion and neutralization number, and plotting this data in order to observe the trend of the curves. The change in chemical characteristics of the oil is apparently arrested if definite volumes of new oil, approximately 0.6 per cent by volume, are added at regular intervals. A bibliography and abstracts are included.

A tentative method for determining dissolved oxygen in boiler feed water is given with definite sampling instructions, methods for preparing the necessary solutions, and test procedure. The method may be applied both in the power plant and the laboratory.—E. K.

Industrial Explorers. By Maurice Holland, Director, Division of Engineering and Industrial Research, National Research Council, in collaboration with Henry F. Pringle. Harper & Brothers. Price $3.00.

MR. HOLLAND, in his "Industrial Explorers" has written the story of some of the more prominent of the men engaged in scientific research who, in our age, have had a large part in transmuting scientific knowledge into improved ways of living. It is a series of vastly entertaining word pictures of simple, sincere men, all Americans by birth or adoption, who have devoted themselves to the solving some of the more practical scientific problems.

Written in all cases, upon the basis of direct interviews, and in many instances, from the viewpoint of years of personal friendship, these stories tell not only their problems and how these scientists went about solving them, but paint lifelike pictures of the scientists themselves, their manners, virtues and idiosyncrasies and contain brief histories of their lives. The book contains sketches of Willis R. Whitney and the General Electric Research Laboratories; Frank B. Jewett and transatlantic telephony; Elmer A. Sperry and his new searchlight "Brighter than the sun"; Leo H. Baekeland and "bakelite"; Arthur D. Little and his laboratory; William H. Bassett and copper; C. E. Skinner of the Westinghouse Electric and Manufacturing Co., and more than a dozen others.

These are simple stories, simply told, of great yet simple men.—E. A. SCOTT.

The Busy Man's Guide to This Issue

Electricity: Index of National Prosperity
Wm. Morgan Carpenter 133
The general principles underlying the formation of an electrical index of industry and trade, as a national indicator of business conditions, based upon the total output of electricity. Such an index should prove of value in measuring prosperity.

Amplifier Considers "Kultur"................*Amplifier* 137
The "Kultur," a much misunderstood and abused word, which Amplifier considers, has nothing to do with the struggle for world power. The Industry's contribution to "Kultur" is seen as the sum total of the progress, achievement and efficiency of our economic life and the advancement in social, scientific and artistic life that may be attributed to electrical development.

Some Representative Research Organizations
Philip S. Siff 141
A number of the larger industrial research organizations are pictured in sufficient detail to present an impression of the thorough going way in which efforts are being made to add to and apply to practical use, the discoveries made in scientific investigation.

Association Is Planning for Greatest Convention........ 146
Indicates a number of factors that will contribute to making the forthcoming N.E.L.A. Convention the most outstanding in its history.

The Accountant's Place in the March of Progress
L. W. Clark 147
Whether or not the gigantic business organizations of tomorrow are going to justify their existence will depend, the author writes, to a considerable extent on the ability of the accountant to meet the situation. The information which the accountant is able to furnish is of vital importance to managerial policies. Practical suggestions on how to increase the accountant's usefulness are offered.

Electric Heat: An Economic Paradox......*B. S. Havens* 154
Electric Heat should be considered a tool in industry much as is the hammer, saw, drill, etc., and as such should be analyzed and its merits weighed. Aside from its obvious advantages in many operations, electric heat is frequently found to be cheaper from a standpoint of overall cost than any other form of energy.

Design of High Voltage Outdoor Substations
L. M. Smith 153
The last of a series of six discussions on the design of outdoor substations. The substations of the Alabama Power Company are discussed in this installment. The cost of high tension substations of a far flung transmission is an appreciable figure in the overall cost to serve. Every economy that can be effected by careful engineering has to be made use of if many extensions are to be justified.

Records That Speed Up Service..............*H. T. East* 159
Systems used by various companies to facilitate prompt servicing of customers. San Antonio Power Company system explained in detail.

The Cost of Electric Service to Farmers
Charles F. Stuart 172
At a rural electric service conference held at Minneapolis, Minn., a number of speakers developed some extraordinary facts intimately related to the question "How much will it cost?" being asked by thousands of farmers throughout the country. Not only was much evidence offered at this conference that electricity could be made to pay its own way on at least many farms, but there were other speakers who offered much definite information as to how a company can organize a Rural Electric Service Department and how that department can aid and guide the farmer in intelligent use of the service.

Interpretations of Electrical Development

Monthly National Statistics of the Electric Light and Power Industries.................. 162
Operating statistics for the month of November, 1928.

Percentage of Farms with Electric Service.................. 162
The first of a series of estimates of number of farms served by the electrical industry by States.

Developed Water Power in the United States.................. 163
Table, with comments, of water power developments in the United States for year 1928, shown by Geographic Sections and by States.

An Evaluation of "1928 Prosperity".................. 164
Output of electricity showed only normal increase in demand. Indication of general level of prosperity. Percentage of increase in production in geographic sections.

Engineering Section

Electrical Apparatus Committee Meeting.................. 165
Resume of topics discussed at Cleveland meeting, January 9-10. Reported by E. E. George.

Reliable Time Delay Under Voltage Devices Now Available........ 166
These devices have passed through experimental stage and are now in regular production. It is hoped manufacturers will educate industrial users as to the merits of this device and encourage general adoption.

Prime Movers Committee Meeting.................. 167
Resume of topics discussed at Pittsburgh meeting, February 4-5. Reported by Edward B. Ricketts.

Progress of Joint Study of Telephone Protection.................. 168
The relation which telephone protection bears to the problems associated with inductive and safety coordination is under active study by the Development and Research Subcommittee of the Joint General Committee of the N.E.L.A. and the Bell System. The more important investigations in which the Development and Research Committee is now actively engaged are discussed, with outline of what may be expected from the work of this committee.

Group Meeting of Engineering Section, New England Division..... 168
Resume of topics discussed at Boston Meeting, February 13-14. Reported by F. G. Harriman.

North Central Engineering Meeting.................. 169
Resume of topics discussed at Minneapolis, Minn., January 21-22.

Commercial Section

Merchandising Bureau Meets at Detroit.................. 170
Resume of topics discussed at Detroit Meeting, February 5-6.

Pacific Coast Commercial Meeting.................. 170
Resume of topics discussed at Los Angeles, February 17-18. Reported by Cristel Hastings.

Accounting Section

Group Meeting Accounting National Section.................. 171
Resume of topics discussed at Chicago Meeting, February 25-26.

Rural Electrification

The Cost of Electric Service to Farmers.................. 172
(Discussed above under "The Cost of Electric Service to Farmers.")

Geographic Divisions and State Associations

News Letter from East Central Division.................. 174
News from this Division reported by D. L. Gaskill.

Conference on Employee Education, Southwestern Division......... 175
Resume of conference of executives and representatives held at Dallas, Texas, January 25.

Women's Committee

News Letter.................. 175
Brief paragraphs on Women's Committee activities throughout the country.

Competition

> Public Utilities in the United States are regulated monopolies, and are also protected industries. The federal courts have laid down the rule that they are entitled to 8 per cent on their investment in property. Accordingly, if they elected, the utilities could exact very high rates from household users and make no efforts to get additional business through stimulating industry. Enlightened self-interest, however, encourages them to build up the communities which they serve, thus getting the benefits of quantity busines and a steady load factor. *Though the utilities have a virtual monopoly in supplying householders, they are in active competition in serving industry. They must not only compete with steam plants and with oil, but also compete with the alternative under which large industrial concerns can generate their own electricity.*—M. S. RUKEYSER in the *Nation.*

THERE are no trade secrets in the electrical industry. Every new development that improves efficiency in the manufacture of our product is promptly made available to the world at large. The manufacturer who generates his own electricity is free to draw upon the experience of engineers who have given and are giving life-long service to the improvement of the service of electricity supply. The municipal plant is equally welcome to the fruits of research and pioneering made possible by both the co-operative spirit and the individual initiative of the privately operated utilities.

Yet, the percentage of power produced locally by industrial plants steadily decreases, while that procured by them from the electric light and power companies moves upward at a rapid rate.

One of the reasons for this, outside of the manifest superiorities of electrical energy for power purposes, is that we "stick to our knitting."

The production and distribution of power—in electrical form—is the prime business of the electric light and power industry. It is the art to which its whole efforts are devoted; it is not collateral to some other business. This is true of no other basic industry. Factories, mines, railroads, all others, are users of power and they may produce power, but their essential object is the production of other goods or services; power to them is important but incidental.

PSArkwright

President.

N·E·L·A· BULLETIN

Entered as Second Class Matter Jan. 28, 1914, at the Post Office, New York, N. Y., under the Act of March 3, 1879.

Published monthly at 420 Lexington Ave., New York, N. Y., by the

NATIONAL ELECTRIC LIGHT ASSOCIATION

A Voluntary Organization of Companies Engaged In, and Individuals Affiliated With, or Interested In, the Electric Light and Power Industry: "Organized to Advance the Art and Science of the Production, Distribution and Use of Electrical Energy for Light, Heat and Power for Public Service."

THE distrust of pure science among the practical is vanishing, principally because pure science has rewarded the practical ones in such concrete fashion.—*New York Sun.*

Some victories lead to an impasse, some defeats open up new avenues.—*Leon Trotsky.*

Convention

IT is not too early to make plans for attending the 1929 Convention. Full transportation and hotel information with reservation blanks will be mailed out shortly from N. E. L. A. Headquarters to all members. While there is not anticipated a shortage of hotel accommodations for Convention delegates, it is certain that the choicer quarters will not be sufficient to supply all demands.

The best hotel accommodations naturally will be given to the early applicants. Memorial Day will come in the weekend preceding the Convention and draw thousands to Atlantic City for a short vacation. This is an added reason for making reservations promptly.

Prizes

ON Page 149 appears a final notice of the N. E. L. A. Prize Awards for 1929. Not many days remain to get competing papers to the Secretary of the Association.

The senior prize, the Doherty Medal, is for the best paper on any subject relating to the Electric Light and Power Industry. There are other prizes totaling nearly $2,000 for the specialized fields of Accounting, Commercial, Engineering and Public Relations.

Certainly here is an excellent opportunity to capitalize in both money and distinction knowledge of the electrical industry.

Conservation

THE improvements in production efficiency of centralized, large-unit, fuel burning plants since 1919 has resulted in a saving of the national supply of coal that is nothing short of dramatic in its import. Economies resulting from increased generating efficiency have done much more for the conservation of natural resources than have—for a striking example—all the installed hydro-electric plants in the United States.

In 1919 the average rate of coal consumption was 3.2 pounds per kilowatt-hour. The rate for 1928 was 1.76 per kilowatt hour or half the 1919 rate. If coal had been consumed by electric public utilities at the rate of 3.2 pounds per kilowatt-hour in 1928 the increase in fuel consumption would have been about 38,000,000 tons, valued at about $150,000,000.

It follows, then, as the Statistical Research Department points out elsewhere in this issue, that had fuel use remained at the same efficiency as prevailed in 1919 and the saving in coal had been effected by the installation of water power instead of steam, it would have been necessary to increase the capacity of the hydro-electric plants of the country by about 14,000,000 horse-power—or to approximately twice their present installed capacity.

Reports

IF evidence were required of the ever-increasing role played by the N. E. L. A. in the growth of the electric light and power industry, the sales, in February, of committee reports and proceeding would be sufficient. In that month, sales amounted to $6,228.20. In February, 1928, corresponding sales were $1,453.56.

It is interesting to note that 1928 sales of Reports and Proceedings amounted to $28,082.03, whereas only a few years ago they were practically nil.

Bearing in mind the fact that the N. E. L. A. does not publish for a profit and that prices are set at the lowest possible figure which will enable the Association to break even on printing costs only, it is evident that a vast amount of material is represented by the above figures, and that the constructive work of the Association's committees is being widely broadcast and effectively used.

Bulletin

LAST fall it became expedient to find some means for enlarging the capacity of the N. E. L. A. BULLETIN. After a survey of possibilities it was estimated that by a slight increase in the size of pages, the use of three columns of type, and a slight decrease in breadth of margins, the capacity of a 64 page issue could be increased by 35 to 40 per cent, using 10 point type, the same size used in the old format. Actually, more additional printing space than this was needed.

This additional space was gained by using 8 point type for the various departments, with 10 point left for the feature articles. By actual check of the material in the two issues that have appeared in new format between 55 and 60 per cent increase in amount of text has been gained—or more than would have been possible by adding 32 pages to the size of the BULLETIN in the old format.

Electricity: Index of National Prosperity

By WM. MORGAN CARPENTER

(EDITOR'S NOTE—This article outlines the general principles underlying the formation of an electrical index of industry and trade, as a national indicator of business conditions based upon the total output of electricity by all agencies which contribute to the public supply. It compares such an index recently developed by the Association's Statistical Research Department with other current indicators and expresses the thought that in the course of time this index will be found of great value as an additional means of measuring the "prosperity" of the country. In the present state of the development of electrical service and of the statistical records of such service, this conception of the curve of normal electrical production is advanced by its author on a tentative basis.)

Mr. Carpenter is Research Statistician of the National Electric Light Association

TWO years ago, there was pointed out in the N. E. L. A. BULLETIN[1] the application of a fundamental principle of biological growth to the number of consumers of electric energy. Bearing a direct relationship to population, the increase in the aggregate of wired homes must necessarily follow the same general laws that govern all development in a limited universe. At this time, when at last there are available ten years' detailed figures, the author is prompted to extend his original thesis and to point out, not only the probable application of the biological laws of growth to the entire use (and therefore of production) of electricity, but also to apply these principles to the interpretation of some of the more interesting phenomena of today's business trends.

Similarity of Growth Curves

Careful analyses of the life-histories of the world's various economic developments invariably reveal curves which are always of the same general form. Beginning with a slow start, successful growth is characterized by a steady acceleration as experience improves and new horizons emerge. Then comes a period of large and regular expansion, followed eventually by a tapering off which is at first imperceptible but which develops with increasing severity as potential markets are exhausted, as the possible uses become satisfied, or as the influence of competitors becomes more pronounced. At last the curve becomes parallel to that of population and the industry (or whatever it is) is said to be "saturated." This general philosophy is illustrated by Fig. 1, which shows the second phase of agricultural production (the country's oldest pursuit), the present life-cycle of pig-iron (a long-established industry) and the first phase of the production of electricity (one of the country's newest enterprises), which, as yet, gives no indication of an approaching saturation. Other curves, whose number is limited only by the ambition of the investigator, could be constructed for almost every other line of human endeavor and these in the present year of grace would show various stages of youth, middle age and senescence. Some indeed (as the life-history of the whale-oil lamp or the colonial expansion of Spain) would show a double curve whose descending line into oblivion would be almost the mirror of its ascending branch.

Accepting this general law with some hesitation and with the reservation that only long historical retrospect can give full and proper interpretation to any economic phenomenon, the author here suggests its experimental application to the service of electricity supply and advances some preliminary observations with the thought that eventually an additional and readily computed yardstick of "prosperity" can be evolved.

Curve of Electric Output

Fig. 2, shows a further analysis of the curve of electric output, which

---

[1] N.E.L.A. Bulletin, Jan., 1927, vol. XIV, page 11.

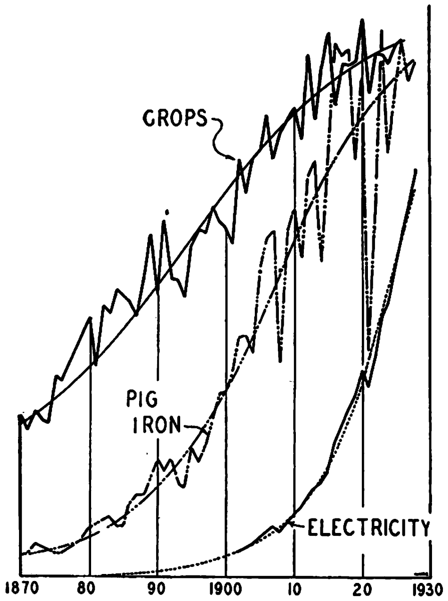

Fig. 1—Typical Production Curves

Suggesting the Application of Pearl's Law of Growth

includes the actual production of electricity by all agencies which contribute, in whole or in part, to the public supply, plus the energy imported from Canada. It rests upon the most reasonable figures calculated from the U. S. Census of Electric Stations (plus those more or less erroneously classified as "electric railways" and so concealed in the U. S. Census of Electric Railways) for 1902, 1907, 1912 and 1917. Since 1919, the total figures are those reported by the United States Geological Survey. Canadian figures comprise those reported since 1919 by the Dominion Bureau of Statistics and, in the earlier years, upon the best estimates available. A smooth curve has been computed, which falls above or below the majority of these points in accordance with the deviation of business above or below "normal," as estimated from the most likely composite of various accepted (though sometimes contradictory) indexes. The relationship between the surplus and deficiency of output with reference to normal is stated in terms of percentages in the saw-tooth line above.

The shape of the curve of normal output strongly suggests one of Pearl's general "logistic" S-type, although the fundamental data afforded by the somewhat confused and overlapping statistics of the earlier years of the industry do not yet permit of the accurate determination of the constants which this type of equation implies. It is, however, a mathematically correct line, whose prolongation into the future is possible. Its form at present approximates a straight line, having departed from the parabola which characterized its earlier stages of growth and not yet having reached the later and eventual stage of tapering off.

The Nation-Wide Diffusion of Electric Service Among All Classes of Consumers

A recent bulletin of the National Industrial Conference Board points out that 73 per cent of all factory machinery is operated by electricity and that nearly two-thirds of this power is procured from the lines of the light and power enterprises. Electricity has thus become the power medium of the nation and the central station plant the point of conversion of fuel and water into the country's major energy supply.

It is significant that all the net increase in the primary power equipment of the United States during recent years has taken place in the power houses of the electrical industry: per contra, the switchboard meters of these power houses have become, in effect,

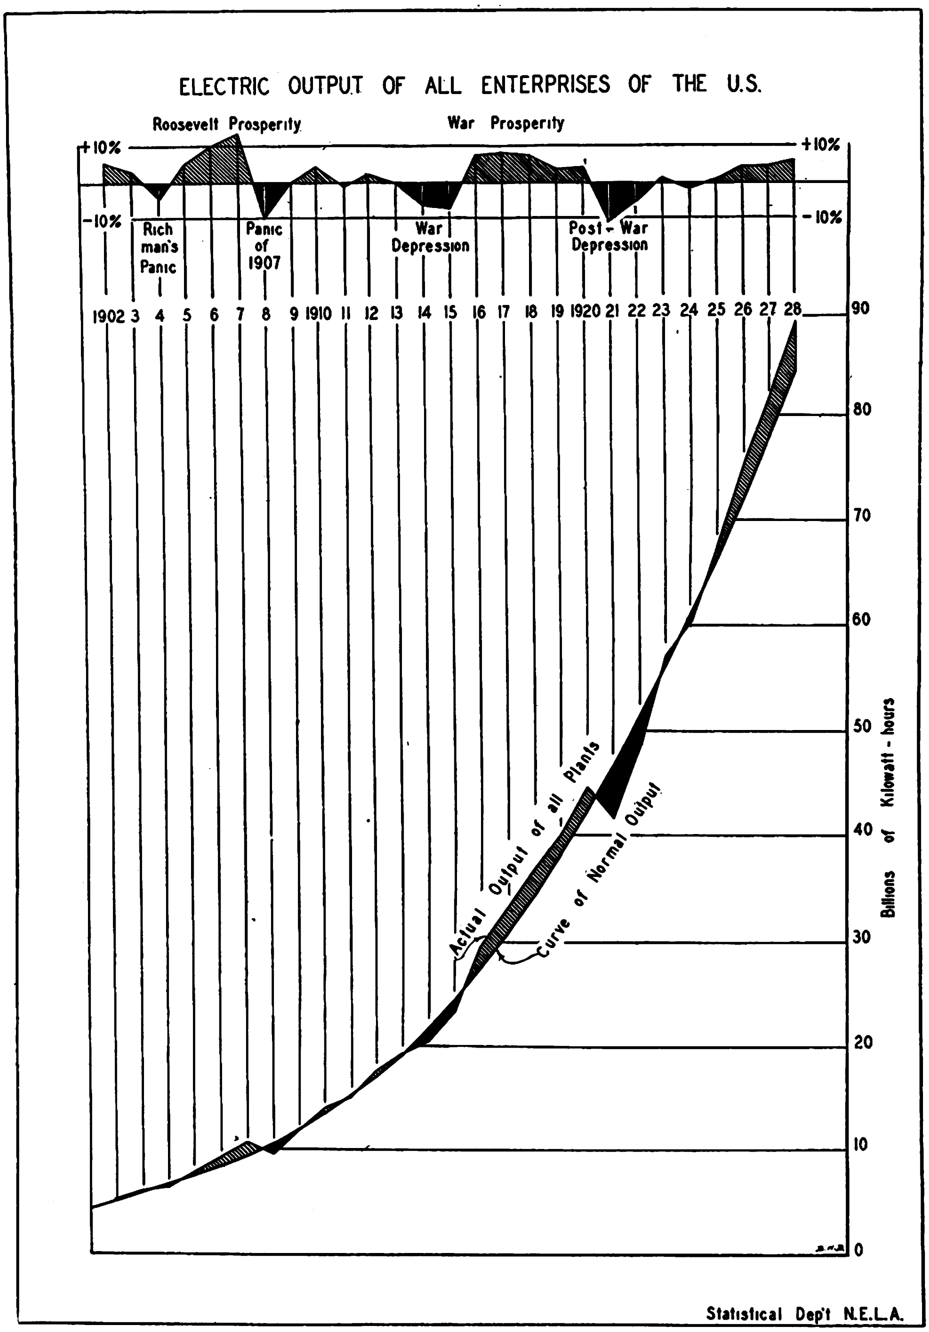

Fig. 2—The Relation Between "Prosperity" and the Output of Electric Energy

("Normal Output" is a smooth curve, with which the "Actual Output" should coincide if industry and trade were exactly "normal." "Actual Output" consists of the net production of electricity by all agencies which contribute, in whole or in part, to the public supply, plus imports from Canada.)

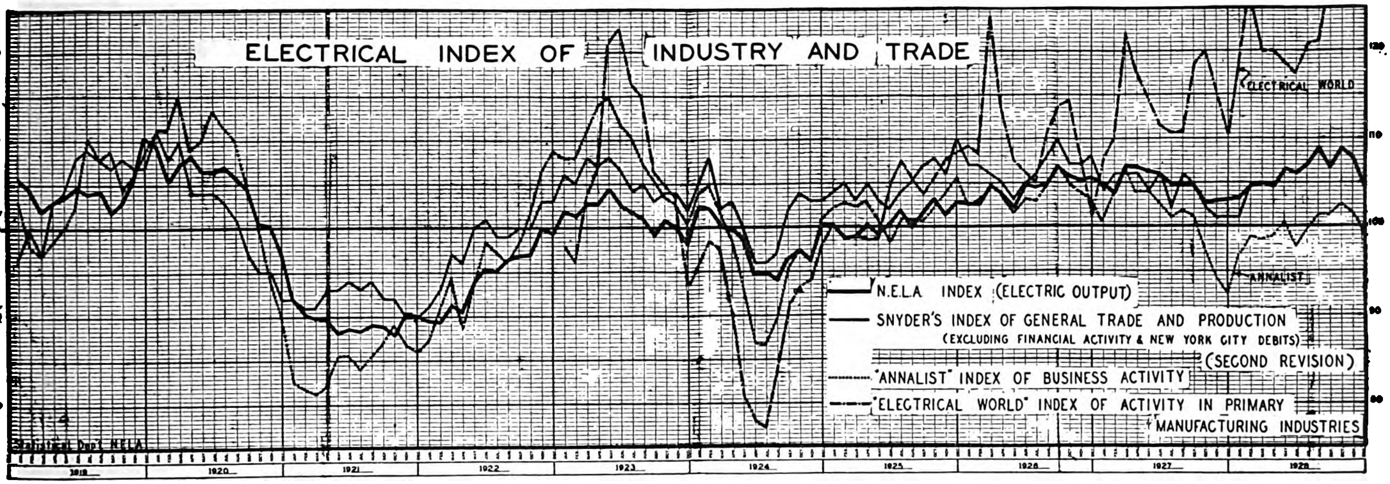

Fig. 3—A Monthly Index of Industry and Trade, Based Upon the Total Output of Electricity

(This constitutes a composite index of the sum total of "prosperity" on the part of the consuming public as well as of the producers of goods throughout the United States, as indicated by the actual total output of electric energy)

the pulses of the operation of the nation's industries to which their wires lead.

Industrial production alone constitutes, however, only a part of the picture of a country's "prosperity." Consuming power is equally (if not more) important, and of this electricity furnishes a similar index. Electric service is now an integral part of the domestic economy of nineteen million households in the United States, and the universal character of this service (extending as it does to 100 per cent of all cities of 5000 population or more, to 97 per cent of all towns with populations between 1000 and 5000, to 50 per cent of all villages with populations between 250 and 1000, to 25 per cent of all hamlets with less than 250 people, as well as its progressive diffusion to the farms of the nation) gives it a geographic distribution of remarkable coverage and accuracy. In addition, there are upwards of two millions of shops, stores, theaters and offices in every city, town and village of the country, whose energy consumption reflects their general prosperity and the state of business in their particular community.

The Use of Energy as an Index of Activity in Industry and Trade

The relative degree to which electricity is used thus becomes a mirror of the country's properity. When business is brisk, factories run more steadily and consume additional power; stores and offices are kept open longer and burn more light; the domestic consumer feels the urge of prosperity and buys and uses additional electrical appliances. When business is slack, the exact opposite takes place. The output of electricity by the public service enterprises of the country thus furnishes a reliable yardstick of the state of business in the nation and the evidence of its industrial activity and social progress.

Some further examination of the inclusion of domestic service among those affected by the fluctuations of "prosperity" appears necessary in view of the pleasant tradition throughout the electric light and power industry that this type of service is immune from the vicissitudes of fortune. It still remains to be proved that the expansion and contraction of the family purse with the earnings of the bread-winner do not extend as far as the meter in the cellar. A certain minimum of light in the home is no doubt necessary, but beyond this there lies the entire question of the relationship of the appliance demand for electricity to "prosperity"—not the prosperity represented solely by business activity, but the far more important phase represented by "a state of mind" which, after all, is still peculiarly sensitive to surrounding circumstances. There are a host of cases where the rise in the purchasing power of a community has shortly been translated into increased kilowatt-hours of domestic use, which phenomenon is often associated with the results either of a fortunate arrangement of the rate schedules or else of increased activity on the part of the commercial department. Conversely, there are others where the results of a calamity or else of a prolonged strike are presently visible in a falling off of domestic appliance demand—a fact to which anybody who has tried to do a merchandising business under such circumstances will probably subscribe.

Construction of Monthly Index

In addition to the regular, normal growth, the production of electricity follows a course of considerable seasonal variation. To some extent, this depends upon the changes in the amount of daylight and temperature. There are also large seasonal swings in the demands of irrigation pumping and still larger ones in the operation of many important industries, such as iron and steel and automobiles, and in the requirements of transportation. This, in a general way, is graphically illustrated by Fig. 4, which shows the output, month by month, by all agencies contributing to the public supply since 1920, as reported by the United States Geological Survey. In addition to this, there is also to be considered the amount imported from Canada, which the chart does not show. While this forms a comparatively small proportion of the grand total, there have been times when some of its increase has been at the expense of power produced in the United States, and vice versa.

When all of the factors of growth and seasonal use are taken into account there remains a figure which represents the amount of electricity which would be needed by the country if business activity were exactly "normal." Any additional output over this amount represents the portion required by the increase in business activity and, conversely, if the total output is less than the normal figure, it represents the portion lost because of business depression. This, in brief, constitutes the basis for the Electrical Index of Industry and Trade,[2] which forms Fig. 3, and with which there are compared other current business indicators. This curve is significant in its conservatism, in its comparative freedom from the wide fluctuations which characterize many of the accepted indexes and in its close correlation with the general average of similar charts. Coming at a time when so many indexes are being prepared by the proponents of this, that and the other thing as the true mirror of business (which charts are often at variance with each other and occasionally contradictory in character) a curve which forms a general average may well be seriously considered.

On the chart there are compared the new Electrical Index, the very conservative curve of Carl Snyder, the *Annalist* index and the *Electrical World's* index of activity in primary manufacturing industries[3]. The correspondence between the new index and Snyder's composite of more than sixty weighted factors is very close.

The comparatively slow changes in the general levels of the electricity curve and the lag behind the others at various critical times suggest that it is influenced not only by production but by variations in the country's purchasing power and by fluctuations in the peoples' standard of living. It suggests an inclusion, not only of the factors entering into the activity of actual manufacture and distribution, but also those more or less intangible ones which are always recognized as existing qualitatively but which other indexes have some difficulty in expressing in terms of actual figures. It might almost seem that further experience over a period of future years may justify the hope that this index represents not only a statistical prosperity—measurable in terms of actual units—but also a composite psychological prosperity.

Will the curve prophesy? No, it will not. There is no way to tell which way the line is going to jump next month. One, and only one, significant fact enables us to make a short-range forecast and that is that all permanent change comes slowly—and the more permanent it is, the slower it comes.

---

[2] This index is constructed as follows: (1) The line of normal annual growth of total electric output has been computed as shown in Fig. 2. (2) This normal annual growth is translated into a normal monthly growth. (3) To each month there is applied a correction for normal seasonal variation, obtained by taking the average of ten years' output for each month and then expressing this as a deviation from the output of each month of the average year of normal monthly growth. These seasonal corrections are:

January ...	105.5%	July	96.7%
February ..	95.6	August	99.5
March	102.4	September .	97.6
April	96.6	October ...	103.8
May	98.1	November .	101.8
June	96.3	December .	105.9

(4) These seasonal corrections are applied to each month derived in (2) and a total obtained which represents the theoretical output in each month if conditions were "normal." (5) The actual output (plus Canadian imports) is compared with this "normal" figure and the deviation expressed in percentages.

These seasonal variations and the resulting index cannot be considered as final. The author has adopted the fundamental principle laid down by Carl Snyder in his description of his first "Index of the Volume of Trade," that for the next few years:

> **"The results here shown are presented simply as first approximations and nothing more. The purpose is to revise the index . . . each year in the light of such new information as may be available as to seasonals, the computation of normal growth . . . and the like."**

[3] Carl Snyder: Index of General Trade and Production (excluding financial activity and N. Y. City debits); 2nd revision; see Journal of American Statistical Association, June, 1928. The *Annalist* index consists of the weighted average of ten items (pig iron, steel ingots, car loadings, electric power, bituminous coal, automobiles, cotton consumption, wool consumption, boots and shoes, zinc) whose deviations from normal have been figured from a computed trend and which deviations have further been corrected for seasonal variation. The *Electrical World's* index is compiled from the monthly consumption of electrical energy by 3626 large manufacturing plants in various industries, scattered throughout the country. It thus shows the use of electricity in primary manufacturing industries, adjusted by the number of working days. It does not appear to be corrected for seasonal variation, nor does it make allowances for the continued growth of the use of electricity at the expense of other forms of energy in these industrial establishments.

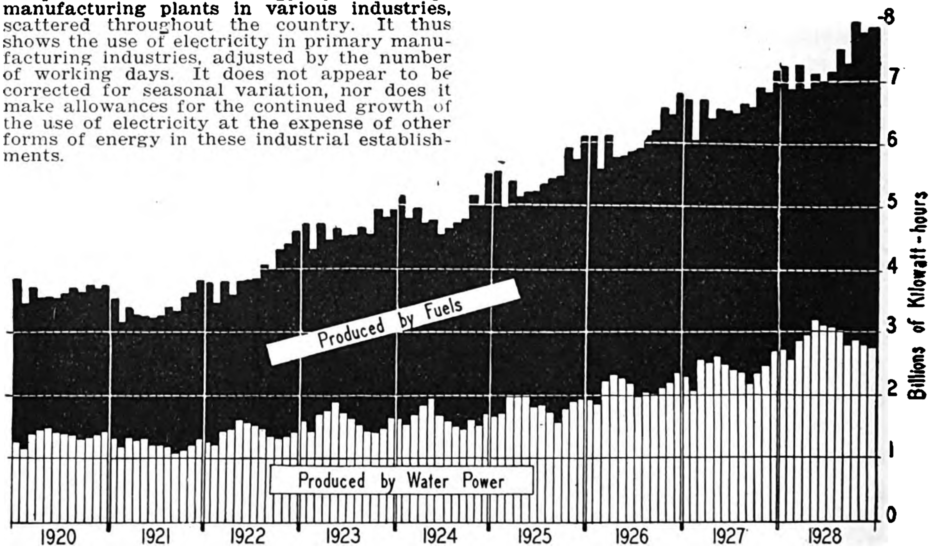

Fig. 4—The Production of Electricity in the United States

(By electric light and power plants, electric railways, public works and certain industrial plants contributing to the public supply. As reported by the United States Geological Survey)

J. E. Zimmermann Heads United Gas Improvement Company

AT the meeting of the Board of Directors of The United Gas Improvement Company held Feb. 27 at Philadelphia, Mr. John E. Zimmermann, Chairman of the Executive Committee, was elected to the office of President. He will continue as Chairman of the Executive Committee.

Mr. Zimmermann, who is fifty-five years old, has been prominent in Philadelphia engineering circles since 1899 when he entered the employ of the American Pulley Company as superintendent of manufacture and later as secretary. After serving with that company for eight years he became associated with Charles Day in the engineering and construction firm of Day & Zimmermann, Incorporated, of which he was president for a number of years. Day & Zimmermann, Incorporated, is a U. G. I. subsidiary. He was elected a member of the Executive Committee of The United Gas Improvement Company on Nov. 14, 1928, and on Dec. 4, 1928, he was chosen chairman of that body.

Although Mr. Zimmermann actively participated in the construction work of Day & Zimmermann, probably his most valuable contribution to the company's success, and the one for which he is best known in the business world, was his work in the reorganization and management of public utilities. This branch of Day & Zimmermann's activities was under his personal direction until a short time ago.

Mr. Zimmermann graduated from the National College of Buenos Aires (1894) and studied engineering at the University of Buenos Aires and University of Pennsylvania, from the latter he received the honorary degree of Master of Science in 1928.

Amplifier Considers "Kultur"

By AMPLIFIER

I WAS talking, not long ago, to an old friend of mine who is the editor of a very great and internationally known monthly. This publication has an editorial policy which 99 educated persons out of 100 would probably describe as a policy of "culture" and place it in that group of periodicals which are presumed to be devoted to "the training, improvement and refinement of mind, morals or taste" (See any standard dictionary).

But while for a period of time including many generations—it has been in existence for scores of years—it may have been devoted to the pursuit of a form of culture within a category covered by such a definition, this magazine seems to have passed out of the rather narrow limits of mere "culture" and into the much broader field of "kultur." Unfortunately, the war has given the word "kultur" an offensive sound to many people. Its use before and during the world struggle seems to have been confused with "Kulturkampf," which in turn is confused with the phrase "struggle for power," used by Bismarck no less than five times in one paragraph in defense of his struggle with the Catholic Church, which he claimed was not the fight "of a Protestant dynasty against the Catholic Church," but "a struggle for power, a struggle as old as the human race, the struggle for power between monarchy and priesthood."

BUT "kultur" has nothing to do with a struggle for power if we are to believe our dictionaries. It simply signifies "progress, achievement and efficiency in all phases, practical or theoretical, of political, economic, social, scientific or artistic life." It is all inclusive and something much more than the Anglicized word "culture," which, through usage, seems to have degenerated into meaning birth, breeding, education and an instinctive knowledge of the right implement and how to use it as the various courses of a formal dinner pass before one.

All of which is only by way of a preamble to serve as an excuse for introducing the discussion with my erudite friend who is editing a magazine of "kultur." Frankly, I was trying to "sell" him on the idea that he should publish something in the way of an article on the financial requirements of the light and power industry, the danger involved in a possible destruction of public confidence, thus stemming the flow of cheap money into the coffers of the public utilities for extensions and improvements, and the unusual economics involved in the operation of our great public services. I may say, in passing, that the editorial policy of this magazine has always been favorable to private ownership and operation; which is as it should be if it really is a magazine of kultur and if the definition of kultur is correct.

Just as frankly, his attitude was "nothing doing," clothed, of course, in the most diplomatic language. Speaking as a representative of his readers, he is not interested in the financial problems of the light and power companies. He believes that the industry is quite big enough to take care of itself and, as an owner of securities in several public utility companies, he feels quite sure that his principal and interest are safe and that nothing which a noisy and small radical minority can do or say will ever destroy the principles of individual initiative and private ownership and operation in this country. Furthermore, he is perfectly satisfied with the rates which are charged and is not interested in any involved discussions of rate structures or rate-making policies.

A REPLY TO SOCIALISM

It beggars wit of man how friend of man
Can postulate that worth should be ignored,
And served, like dole, the national reward
Of power (begot, since social life began,
By vision, thrift, self-sacrifice, the sword),
In equal lot to queen and courtesan,
To dullard, loafer, genius, saint and lord,
The craven and the leader of the van.

Shall mediocrity and worthlessness
By any sort of justice, rape and share
The tribute of devotion, courage, stress?
No body-politic could breathe that air;
But common-sense decided, once for all,
That to the early bird the worm should fall.

Destroy the will to win and who remain
Can sharp our wits, or better our degree?
For nature ever spurns equality
And no two skulls yet held an equal brain.
Strive the unborn shall fight their battle free,
Clean of their blood, unhandicapped and sane;
But moral evolution we disdain
By dedicating all to slavery.

The sons of men you cannot standardize,
Or rate their value ere the same be known.
Our mighty hoard their huge, uncounted prize
Within the hearts of fellowmen alone.
Start the norm fair; then let each brother learn
A man is worth the wages he can earn.

—EDEN PHILLPOTTS
in *Nation's Business*

ALL of which is worthy of note only in that it leads to certain interesting speculation. Is it not just possible that the light and power industry is making an even greater contribution to the progress of civilization than its contribution to material welfare or, as it is more often called, prosperity? Is it not just possible that the person of average intelligence has been thinking dimly about these things and has reached a stage of mental development where he finds them more interesting, more stimulating than discussions about mass production, high wages, national wealth and what not? In other words, is it deserving of consideration in terms of "progress, achievement and efficiency in all phases, practical or theoretical, of political, economic, social, scientific or artistic life?"—briefly, in terms of "Kultur."

I think so. Personally, as a person of presumably average intelligence, the continued statements about the increase in the billions of kilowatt hours used each year have about the same appeal for me as the mortality tables of the life insurance companies. I read the stories issued by the Department of Public Information of the National Electric Light Association, through the medium of its weekly *Electrical News Items* explaining how the demand for power is an accurate index of manufacturing and business activity and, therefore, of general prosperity, and feel like saying: "Who cares?" I study carefully various graphs and charts as well as innumerable tables of statistics and, to borrow a phrase from former Governor Smith, get about as much comfort out of them as I would out of a Chinese laundry ticket.

It occurs to me that those whose duties are to give out information about the light and power industry either confine their definition of prosperity to "the state of well being," or else feel that this being the accepted definition, there is no profit in going beyond it. This, of course, raises the question as to what real prosperity really is and whether or not it has any attributes which place it within the scope of our definition of "kultur."

ABOUT two months ago Jose Bornn, Jr., the financial editor of the *Industrial Digest,* touched on this subject in an important magazine article which began with the question: "What is Prosperity?" According to Mr. Bornn, real national prosperity represents something more than "income tax returns, or pig iron output, or automobile registrations." He even doubts if the fact that the Christmas Clubs throughout the United States distributed in December more than 550 million dollars to thrifty citizens is a factor worthy of very great consideration. He insists on dispensing with slide rules, adding machines, charts, graphs and involved mathematical calculations in his contemplation of past, present and future prosperity, and, brushing aside any and all available statistics, reaches the interesting conclusion that it is nothing more or less than a state of mind—a reflection of prevailing psychology rather than a "tangible statistical entity." But what does he mean by these phrases?

Second Darky: "Well, mah name am Mose, and mah wife's name am Dinah, and if Dinahmose don't make electricity, what does dey make?"—*Open Road.*

MRS. WHEELER EXPLAINS

Jase came hurrying home from a big convention of the Electric Association. Jase had a button on his coat lapel, which had the letters C and E and R on it, with an equal sign and a minus sign between them.

"What does that symbol mean, Mr. Wheeler?" somebody asked in the party.

But Jase did not hear the question, and so the question was asked of me. I do not remember who asked, but it was apparently thought I should know, and of course I did not like to display my ignorance, so I tried to fix up an answer.

"Oh, he has just been to a convention," I said, not noticing that Jase had turned and was listening. "That symbol means, Convention equals Energy minus Reason."

You can imagine how mortified I was when Jase let out a roar of laughter that filled the room. "Correct, correct," he shouted. "It beats the dickens how the women get things right by intuition, where it takes us men years of hard work to get the answer."

Of course after the party was over, he did explain to me that those letters mean that Current equals Energy divided by Resistance. But just the same, I was humiliated beyond words, and it did not make me feel any better afterward, when he told me, a hundred times, how he had made the big engineers laugh with my translation of their symbol.

But why shouldn't I think of conventions when I saw that letter C? It seems to me that there is some kind of an electric convention every week, and that Jase, when he isn't away for some other reason, is attending a convention. I once asked him if there would never be an end of these conventions, and he said no, not as long as some engineer, big or little, bobbed up somewhere with some new discovery about electricity that the others needed to know.

"Electricity is still so new, and our methods of handling is still so crude," he would say, "that we will have conventions until we reach perfection in handling it, and completion in our knowledge of it. Then we will have more conventions, probably, to sit around and pat ourselves on the back."—Jonathan Brooks, in *Chains of Lightning.* Bobbs-Merrill, Indianapolis.

What he is really talking about, in my opinion, is cultural and social progress as represented by demands for improvements in standards of living, and, in so far as those demands are filled, we have prosperity. In fact, he says that prosperity is nothing more or less than a standard of living. He might very easily have gone further and said that, in so far as civilization is concerned, its progress is represented, not by increase in so-called material welfare, national balance sheets and profit and loss accounts, but by the demands of the people for something more—a spiritual demand, if you will—in the way of culture, or, preferably, kultur.

Now we seem to be getting somewhere. If prosperity is nothing more or less than a standard of living and, to return to our definitions, if a steady improvement in standards of living is "progress, achievement and efficiency, in all phases, practical or theoretical, of political, economic, social, scientific, or artistic life," it should be a simple matter to find out whether or not the light and power industry has contributed something more to our lives than mere improvements in food, shelter and clothing, in bank accounts and wordly possessions not usually classified as necessities.

SUPPOSE we take up first the workers—that great group of people whose efforts are, in the last analysis, the basis of all production. If we turn to the statisticians we are told that the average amount of power available to each American worker was 4.27 hp. in 1925 as against 2.11 in 1900, with the amount constantly increasing. This, of course, has largely increased the output per worker which, in turn, has given to the American worker the largest real wage of any worker in the world. He has more money to spend and more time to spend it for the things which mass production has brought within the range of his pocket book.

But time and money to spend do not make for cultural and social progress unless there is some stimulant to a desire for improvement in mental equipment as well as in material comforts. What has electricity done in this direction?

In the first place, the application of the individual electric motor has brought about a tremendous improvement in working conditions. It is no longer necessary to build a manufacturing establishment around a central boiler and steam engine like a barracks. It can be subject to almost any architectural treatment that may be desired. There are modern American factories which, because of their architecture, lawns and flower beds, look more like educational institutions or summer hotels than places where men labor with their hands. There may be a few so-called "practical" business men of an older generation who sneer at this sort of thing and claim that it is only wasted on labor, intent on getting all that it can for the least amount of effort, but they are growing fewer every year and soon will be only a page in the history of industrial development. The character and appearance of the place where one spends most of his working hours has quite as much effect on the character, ability and general contentment of the member of a labor union as it has on the bank president or college professor, and he is just as much entitled to these influences if our prosperity means anything at all.

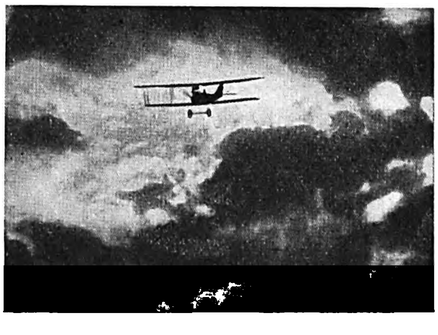
Inside the factory equipped with individual electric motors operated by power from a central generating station the most noticeable thing •is the absence of the dirt which characterized the factory of a generation ago. Who will deny the value of a social influence of this kind? Compare the appearance of the worker in one of these modern factories with the worker in a factory of fifty years ago, and one finds as much difference in their appearance as there is in the appearance of the factories themselves. This influence is bound to permeate the home of the worker and has contributed to the prosperity of the bath-tub, plumbing and other industries which deal in aids to cleanliness.

BECAUSE of the absence of the dirt and dust caused by the old-fashioned boiler and steam engine plus the over-head shafting, pulleys and belting which were necessary, the windows are clean and there is an enormous increase in the amount of light. Good lighting is just as important in a manufacturing establishment as it is in a public school. It means greater comfort, greater safety, a reduction in industrial fatigue and, if we wish to speak in terms of production, an increase in the productivity of the individual worker with considerably less strain. It means not only improved working conditions, but inspires the individual to demand the best of lighting in his home and in the schools attended by his children.

Electricity has given a "dignity" to labor which the worker has never before enjoyed. He is just as much a director of power as the engineer of the Twentieth Century Limited. He is no longer a laborer in the sense that the word was used a few decades ago. Industrial accidents and fatigue have been reduced and the worker's status as "a social person" has constantly improved. He has more leisure and a greater capacity to enjoy it. He demands more in the way of education for himself and his family, and who will say that this is not an even greater contribution to the future of the nation than the accompanying increase in material comforts? And, as Lord Rothermere said after returning to England from a visit to the United States "The day is visibly approaching when practically all the hard manual work of the United States with its 118,000,000 people will be done by electricity, and done far more swiftly and cheaply than human labor could accomplish it." The elimination of manual labor most certainly falls within our definition of "kultur."

Last month I wrote an article for the BULLETIN which contained a description of a modern electrified farm. Electricity has pulled many a farmer away from the chasm of bankruptcy and set him firmly on the high road to prosperity, as meaning material welfare, but what else has it done for him and what will it eventually contribute to agriculture as a whole?

This farm has a house heated by means of an electrically controlled oil burner in the cellar. It has a reading room, dining room, locker room and showers for the "help." It has electric lights, bath rooms, an electric washing machine, refrigerator and vacuum cleaner. It is as completely equipped and up-to-date as any house in the city. Outside there is running water in the barns and other buildings, the water being pumped by an electric motor. Milking, grinding feed and many other chores are also done by motors. The owner, a college graduate, had started with a down-at-the-heel farm, a little money, a lot more that he borrowed, and he is now as prosperous as a small factory owner or a well-to-do merchant in the city. His children will go to college and he and his wife are getting vastly more out of life than the average city dweller.



THIS is not a single, isolated case of an experimental farm. There are today 350,000 electrified farms, and rural electrification is proceeding almost as rapidly as factory electrification did in the early days. In other words, manual labor is being eliminated on the farm just as it is being eliminated in the factory. The farmer himself and his "hired man" have more leisure, more money, a greater dignity of occupation and a new outlook on life. The farm is becoming an individual industrial establishment with working conditions and a mode of living as good, if not better, than that of the city worker. The education of children is no longer a problem. Can it not be said that this is a tremendous progress in both the social and scientific phases of farming? Is so, then it, too, falls within our definition of kultur. Furthermore, as rural electrification progress we can confidently expect to see the so-called "drift from the farm" cease, and there may very easily be a trend in the other direction.

We hear much about the radio these days, and the fact that the millions of them installed in homes is significant of great material welfare. But radio is so much more than a scientific toy designed to amuse, or a symbol of prosperity, that one wonders why its contribution to social progress is overlooked. With it the individual can sit in his own home and attend the political meetings of all parties, weigh the arguments of various speakers, one against the other, and can have no excuse for not attending to the duty of voting with the utmost intelligence. Sooner or later the radio will contribute materially to the breaking down of party lines.

This same individual, if his education has been limited, can go to school, attending lectures by men of national reputation. He can listen to the finest music. He has every opportunity to progress in the social, scientific and artistic phases of life, and once more we find electricity bringing into his home those elements which fall within the definition of kultur.

One could go on almost indefinitely enumerating the things brought into the home or workshop which have contributed not only to the comforts and pleasures of living, but to the mental equipment which make for social and cultural progress without which material prosperity would be an empty thing. Automobiles, pianos, victrolas, all are in the same category. The financial independence accompanying the prosperity of the United States is a great thing, but it is not an end of itself; it is only a means to an end, which is progress, mentally, morally and spiritually.

IN our definition we find the word "scientific." There must be progress, achievement and efficiency in the scientific phase of life. What has electricity contributed to scientific advancement? The great laboratories of the industry in which thousands of scientists are at work have perhaps contributed more to the general health, prosperity and happiness of the people than any other factor in our national life. One has only to visit a modern hospital to see much of the evidence of it. The debt of the medical profession to electricity and to the devices produced by these laboratories for its application to diagnosis and surgery can never be completely told. The industrial chemist, guiding the manufacture of steel, cement and a thousand and one other commodities owes much to electro-chemistry. The dentist, optician, research worker, all know and acknowledge their obligations to applied electricity.

The research work which is going on in these great laboratories is by no means confined to studies which, it is hoped, will directly benefit the light and power industry in one way or another. Take, for example, carboloy, a product of the General Electric Company laboratories. One of the greatest contributing factors to mass production is high-speed steel, "Carboloy" is a new hard steel alloy which will cut steel at speeds and temperatures unheard of in the past. It is so hard that it will scratch sapphires, and next to a diamond the sapphire is the hardest known substance. The new alloy will cut 16-in. battle armor plate and a screw thread on great blocks of plate glass; it will tool porcelain, bakelite and manganese steel—all of them most difficult tasks. The General Electric has been using carboloy in its own shops for more than two years with marked success, not only cutting down the time necessary to complete certain operations from four to ten times, but doing the work at about one-fourth the cost. Now the company hands it to industry, and the whole industrial structure will be immeasurably benefited.

SURGES AND FLASH-OVERS

By FRED W. HERBERT
Director, Service Department, NELA

There will be no BORED walk this year at the N. E. L. A. Convention at Atlantic City, June 3 to 7 and talk about "being lit up," nothing like it ever before.

A friend of ours was presented with an unmbrella "with 1000 blessings." Considering the nature of the gift, wouldn't "1000 happy returns" be more appropriate?

* * * *

Fashion note—Scotch tweed suits will have smaller pockets this season.

* * * *

A five-acre farm electrically and scientifically worked, beats twenty-five acres of the old-fashioned careless method.

AND last, but perhaps most important of all, what has the light and power industry done for the women of the country — particularly for the mothers? It has eliminated, once and for all, drudgery in the home. This subject requires little discussion. Every one who reads must know something of the many devices which can be operated for a small monthly charge and which will do most of the hard work of housekeeping better than the average servant or, in these days of temperamental domestic employees, help keep a servant in the house. It has emancipated women from occupations which contributed little or nothing to their own cultural and social advancement, unless one counts tired and aching muscles at the end of the day and signs of age long before they are due as cultural and social advancement. It has given her more time for her children, for self-education, and removed the utterly hopeless outlook of the household drudge: "American homes," says Lord Rothermere, "are depressed by far less of the constant drudgery that disheartens so many English women." That is the word—depressing. Nothing is so depressing as contant, routine labor that holds no interest for the laborer.

And so, if we turn back once more and for the last time to our definition, we find this great industry contributing to that all-inclusive summing up of progress—kultur. It has contributed to the progress, achievement and efficiency of our economic life which has made us the most materially prosperous nation in the world. It has contributed to our political life through the process of education in the great issues of the day. It most certainly has made notable contribution to the many phases of social, scientific and artistic life. What other great industry has done quite so much in this regard?

Some Representative Research Organizations

By Philip F. Siff

STIMULATED by the almost miraculous results obtained under the spur of necessity in our laboratories during the World War, scientific research has since come to play an ever-increasing role in the industrial life of this country. Leading corporations in every line of industry now employ the services of many trained investigators, and expend great sums of money on elaborate research laboratories. The far-seeing men who guide the destinies of these companies are aware that any discovery, even though it appear insignificant, that is made within their fields of operations, may have a vital effect on the future of their companies.

The discovery by German chemists several years ago of a synthetic process for the manufacture of methanol, or wood alcohol, by combining water gas, and steam, threatened for a time to eliminate the American wood-alcohol industry, with a total invested capital of more than $100,000,000. Because of the complex ramifications of modern science, a discovery in one field of investigations may have the most far-reaching effects on industries that are apparently remote. At no time in the history of industrial progress was it truer that elternal vigilance is the price of safety.

IN considering the place of research in industry, the entire emphasis must not be placed, however, on the epoch-making discoveries that have influenced the course of entire industries. Among the major problems of modern research are those of reducing the cost and improving the quality of products and processes already in existence. In a period such as the present, when steadily declining commodity prices have reduced margins of profit in many industries, it is only the low-cost, most efficient producer that may hope to survive. In this economic struggle for existence, the research laboratory has proven itself a weapon of unlimited power.

Mr. Siff is connected with the investment banking firm of Lehman Brothers, New York. He is a graduate of Harvard, and spent two years of study in Europe before commencing his business career in the Statistical and Research field.

It is with these general considerations in mind that we have come to the definite conclusion that other things being equal, the companies which are at present time devoting the greatest amount of energy and money to the problems of fundamental research will, in the years to come, be found leading in the industrial race. Although the money expended in research may seem to the short-sighted stockholder to be needlessly diverted from dividends, over a sufficient period of time, it will be directly reflected in the market price of the company's securities.

In this article a number of the larger industrial research organizations are considered in sufficient detail to give an impression of the thoroughgoing way in which efforts are being made to add to and apply to practical use the discoveries made in scientific investigation.

While those institutions devoted to research in the electrical field may be assumed to be of greatest interest to readers of this publication, several organizations specializing in other fields are considered for the sake of the broader picture of industrial research.

The information on which the descriptions are based has been obtained in part from the publications of the National Research Council, the organization which has been the greatest single force in making the importance of research a matter of general knowledge. and in part from the officials of the companies discussed.

General Electric Company

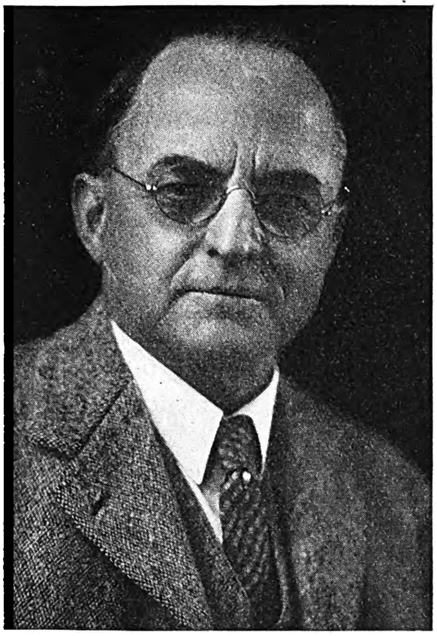
This corporation has for many years carried on extensive researches along very broad lines. Its laboratories are of the highest standing, and among its investigators have been scientists of worldwide reputations.

The company maintains a Research Laboratory at Schenectady which is devoted to general problems, and employs about 350 people. In addition to the Research Laboratory there is a General Engineering Laboratory which performs valuable services in connection with the development of specific electrical devices and maintenance of standards. There are additional laboratories at the National Lamp Works, and at Lynn, Pittsfield, Erie and Fort Wayne.

Among the numerous investigations being carried on by the Research Laboratory, the following are some of the more important: Lamp development; steel research; insulating materials; radio tube development; photo-electric cells; loud speakers; development of extra high voltage transmitting cables; the Langmuir atomic welding method; the new mercury boiler; studies along the lines of electric refrigeration; the Coolidge cathode ray tube, its development and possible uses; synthetic sapphires; studies on the improvements of substitutes for paints and other protective coatings.

At other plants, investigations are being made in the fields of talking movies; television and fused quartz of extra fine quality.

Depending upon the need for investigation at the various plants, the

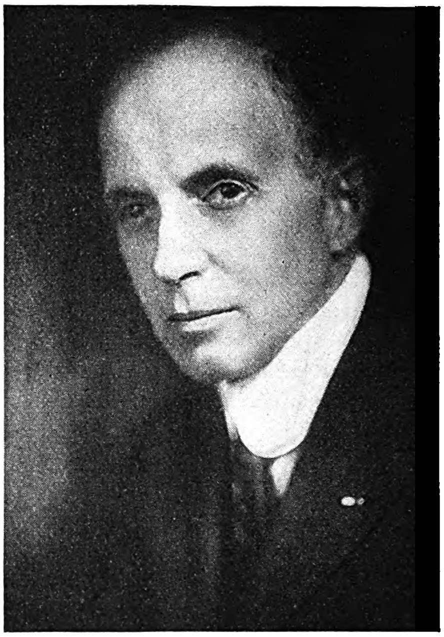


WILLIS R. WHITNEY

Director of Research Laboratories, General Electric Company

C. E. SKINNER

Assistant Director of Engineering, Westinghouse Electric and Manufacturing Company



FRANK B. JEWETT

President, Bell Telephone Laboratories

number of workers employed in research varies between 1000 and 1500; and the total amounts expended are between three and four million dollars a year.

Within the past few years, the following important processes and devices have been placed on the market as the result of discoveries made in the General Electric laboratories: The ductile tungsten Mazda lamp; the Coolidge X-ray tube; improved steel for transformers; improved insulating materials and substitutes for paints and varnishes; improvements in turbine manufacture; a variety of radio tubes; a new highly efficient high-vacuum pump; two new types of loud speakers; and a new scheme of brazing large-sized metal parts together.

Westinghouse Electric and Manufacturing Company

As the second largest American manufacturer of electrical equipment, Westinghouse necessarily maintains an elaborate research organization. Approximately 500 workers are employed by the corporation and its subsidiaries in experimental research and control of materials, of which number about 300 are engaged in the more theoretical branches. Total expenditures for research, testing and development amount to $5,000,000 annually.

The investigations that are now under way are of diverse nature. Numerous studies are being conducted on insulation methods and materials; on magnetic phenomena and means of securing magnetic materials, and on the physical properties of various metals and alloys, with the object of enabling them to better resist severe service conditions. Inquiries are being pursued concerning various kinds of vacuum phenomena, ranging from delicate photo-electric cells, glow discharge devices and a great variety of radio tubes to large metal tank mercury rectifiers.

The corporation's scientists are now studying a number of problems in the field of acoustics, with the dual object of a better production of music and speech, and the elimination of noises produced by different types of electrical machinery.

The "Televocal" system of distant control, a development of the Westinghouse laboratories, recently received the most wide-spread attention in the daily press. This invention, which enables a power despatcher to communicate by telephone with an electrical automaton in a distant substation, receiving reports from and transmitting orders to the inanimate mechanism, seems to bring appreciably closer the dawn of a completely electrified civilization.

Other less sensational products of the laboratories are the improvement of magnetic and insulating materials; vacuum tube devices for radio work; structural steel welding for use in building construction, and lightning arresters for the protection of apparatus in service.

In collaboration with the Baldwin Locomotive Works, the corporation has achieved noteworthy results in the electrification of locomotives and other railway equipment.

Experiments looking toward the transmission of motion pictures by radio have already reached a point where favorable results may soon be looked for.

Bell Telephone Laboratories, Inc.

The Bell Telephone Laboratories, Inc., controlled jointly by the American Telephone and Telegraph Company, and the latter's subsidiary, the Western Electric Company, is undoubtedly the greatest organization in the world devoted to cooperative research. The principle of the Division of Labor, on which modern industry is based, has here for the first time been applied systematically and on a large scale to the solution of scientific and technical problems. Investigations of the utmost complexity are here analyzed into their component parts, which are in turn submitted to groups of scientists and technicians whose training has been along the precise lines of the given work. In this way, vast problems which might well require a life-time of labor on the part of independent investigators, are in the Bell Laboratories solved in the brief space of a few years, or perhaps even months.

An institution of this nature, whose work has a vital bearing on practically all the companies forming the net-work of telephone communication in the United States, must necessarily be a large and complex organization. There are approximately 2000 research physicists, chemists and engineers employed by the Laboratories. Including those employed in various capacities which are not strictly technical in nature, there are about 3700 employees on the Laboratories' payrolls. The total expenditures of the Laboratories are reported to amount to $13,000,000 annually.

THE work of the Bell Telephone Laboratories is carried on by five principal divisions which operate in separate fields, although there is close cooperation between them at all times. Of great importance is the Patent Department, consisting of a staff of more than 100 registered patent attorneys and technicians who advise the research staffs as to which new ideas may be protected by patent, and who maintain a vigilant guard against infringements of the company's patents either in this hemisphere or Europe. In the department's files are copies of 500,000 patent records, which are being added to at the rate of 25,000 a year.

The Research Department is concerned with a development of fundamental physical principles, particularly those relating to the problem of communication. The Apparatus Development Department, as its name implies, has charge of devising all new apparatus that is to be made standard for the associated companies. The Systems Development Department combines and coordinates into smoothly functioning telephonic systems the new apparatus that is developed. The Engineering Inspection Department compares the performance of new apparatus and systems in actual practice with the promise held forth by the laboratory tests.

Although the problems under investigation by the Bell Telephone Laboratories are far too numerous to be enumerated here, the principal fields of experimentation may be briefly indicated. Basic investigations deal with electronic physics, including X-rays; development of new alloys; the nature and characteristics, and the sensitivity and range of the human ear; new vibrating systems, and their application to loud speaking receivers, cones and horns; military and naval communication and signalling; the electrical transmission of pictures, and talking moving pictures.

In the field of switching and controlling transmission, researches deal with manual and machine switching central office equipment and systems; high-frequency carrier current systems for multiplex telephony and telegraphy; remote control of power substations; and a multitude of detailed investigations connected with communication apparatus and systems.

Inasmuch as the American Telephone and Telegraph Company has a virtual monopoly of telephonic communication in the United States, it would seem at first thought that it has not the same incentive to research as companies engaged in more competitive fields. However, in the case of the telephone companies, research has been used not as a weapon with which to ward off the threatened attacks of rivals, but rather as an instrument for improving service and reducing costs. Because of the vast scale on which it operates, the company has the opportunity to effect almost limitless economies.

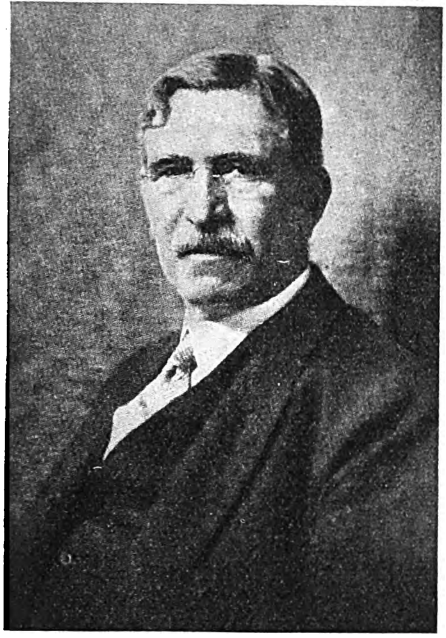
Several arresting examples of such economies may be given here. As the result of the Laboratories' investigations, the company was enabled to replace a standard electrical contact which consisted largely of platinum by a less expensive type. This substitution has resulted in an annual saving of about $9,000,000. By using "Permalloy," a nickel-iron alloy developed by the Laboratories, instead of iron dust for the cores of loading coils, there has been made possible an annual saving of $2,000,000 in the original cost of these coils. The loading coil itself has been an invention of very great importance in the history of the telephone industry. This device, developed in the Laboratories from a basic patent of Professor Pupin's, prevents the distortion and weakening of the speech currents. It has been calculated that if the loading coil had not been perfected, and if the same telephonic facilities that are now enjoyed had been made possible by the use of larger copper wires, the investment in plant equipment would have had to be one-third of a billion dollars greater than it actually is. It is partly due to such colossal savings as these that the company's earnings have increased steadily over a period of years, in spite of the fact that the increase in telephone rates since 1913 has been only half as great as the rise in wages and costs of material.

In addition to these improvements which have a definite money value, there remains a great body of work and discovery whose value can only be expressed in terms of utility and service. There has been the phenomenal development of the vacuum tube, which, in the form of a "repeater" has made transmission possible over distances of four to five thousand miles; and which is the basic factor in multiplex telephony, with its seemingly miraculous phenomenon of five simultaneous messages transmitted over a single telephone circuit. As a result of years of patient experimentation, direct subscriber communication with England was recently inaugurated.

One of the Laboratories' discoveries, known as "Permalloy," an alloy of about 80 per cent nickel and 20 per cent iron, specially heat treated, has remarkable magnetic properties many times greater than those of the best irons and steels hitherto known. Through the use of "Permalloy" in submarine cables, the speed of transmitting messages has been increased more than four times, with a proportionate increase in the capacity of each cable.

AS a by-product of its researches directed toward an exact method of describing and measuring qualities of sound, the company perfected a new type of recording and reproducing phonograph, which, under the trade name "Orthophonic," has been produced commercially by the Victor Talking Machine Company. Other products of these same investigations have been the "Audiphone," a scientific hearing aid for deaf people; and the electrical stethoscope, which promised to be of the greatest value in medicine.

Through intensive development of the photoelectric cell, itself an old discovery, the Laboratories perfected a practical method of transmitting photographs over telephone circuits, so that a picture taken in San Francisco one morning may be published in that evening's edition of the New York papers. In connection with this problem were developed the perfectly synchronized motors which later formed



CHARLES L. REESE

Chemical Director E. I. DuPont de Nemours and Company

the basic apparatus of the well-known "Vitaphone."

It may be seen from the above examples how far-reaching are the results of the work done by the Bell Telephone Laboratories. From the anvils of these busy workshops fly sparks that fall in unexpected places. Here the fine lines of thought are spun into a strong web of communication binding together the entire country.

E. I. Du Pont deNemours & Company

This company maintains laboratories in connection with the following departments: Chemical, Dyestuffs, Technical, Explosives, Smokeless Powder, and Paint, Laquer and Chemicals. Independent laboratories are maintained in addition by these subsidiaries: DuPont-Pathe Film Manufacturing Corporation; DuPont Rayon Company and the DuPont Viscoloid Company.

The principal subjects of investigation lie in the fields of heavy chemicals, paints and varnishes, nitro-cellulose, dyes, vulcanization accelerators; "Semesan" and other seed disinfectants; high explosives, smokeless powder, compositions utilizing nitro-cellulose as a base for protective coatings; motion-picture film; rayon and cellophane; pyroxylin plastics and other molding compositions.

Probably the outstanding contribution to the industrial arts that this company has made in recent years is the development of "Duco," a rapid-drying nitro-cellulose lacquer. Through the use of this product, the auto manufacturers have been enabled to reduce by approximately five days the time formerly required for painting an auto, and thereby save millions of dollars annually.

Another work of the highest importance has been the development of several new vat dyes which have made this country practically independent of the foreign dye producers. Allied to the work in dyestuffs has been the production of rubber accelerators, which are used to shorten the time required for vulcanizing rubber products; and the seed disinfectants known as "Semesan," which increase the yield of agricultural crops by preventing the ravages of plant diseases.

The company has achieved truly remarkable results in the development of a substitute for leather made by coating cotton fabrics with pyroxylin, a cellulose-nitrate composition. The resulting product, known under the tradename "Fabrikoid," is a waterproof, resistant material that can be embossed and finished in grains that simulate natural hides. It is widely used for upholstering automobiles and furniture. manufacturing luggage and wardrobe trunks, bookbindings, wall coverings, and novelty products.

Another product of first-rate importance that has emerged from the DuPont laboratories is a new non-freezing dynamite which can be used safely and economically in the most northern of our mining territories. In order to perfect this product, the company had to readjust 110 dynamite formulas.

The plastic materials, "Pyralin" and "Viscoloid," have been so improved along æsthetic and utilitarian lines that they now have a very wide field of usefulness, being employed for toilet sets, umbrella handles, belt buckles, unbreakable fountain pens, tooth-brush handles and every type of novelty.

The laboratories of the DuPont Rayon Company are continually working to improve their product, which is made by the viscose process. One of their important achievements has been the development of "DuPont Super-Extra," a multi-filament yarn of greater softness than the regular grades. This is now standard in the field of fine underwear, hosiery and velvet.

C. E. K. MEES

Director of Research Laboratory, Eastman Kodak Company

In concluding this account of the DuPont products, mention must be made of photographic film, which is rapidly assuming a more important position on the company's list. Although the manufacture of motion picture film is the youngest of the DuPont Company's ventures, the processes and materials involved are so closely related to those employed in many of their other products, that the company possesses exceptional technical resources available for application to the problems of film production.

Including the workers at the laboratories of its principal subsidiaries, the company has about 1000 employees engaged in all forms of research. Although there are no figures available for current expenditures on research, one may obtain a rough idea of these amounts by means of the figures for previous years. In the period 1915-1918, according to the annual report for 1918, the total expenditure for experiment and research amounted to $3,360,000, an annual average of $840,000. For the seven years 1912 to 1918. total expenditures were $6,051,000 or an annual average of $856,000. During this latter period, according to a statement of Charles L. Reese, Chemical Director of the company, the calculable saving directly attributable to research amounted to $82,401,000, or ever 13 times the cost of the research. It would be difficult to find a better commentary on the value of research. Since 1918. expenditures on research have increased

GOVERNMENT (POLITICAL) OWNERSHIP AND OPERATION AND THE ELECTRIC LIGHT AND POWER INDUSTRY

New edition now available at the headquarters of the National Electric Light Association

Contains 530 pages devoted to the intrusion of government into business and the municipal operation of electric light and power plants. Chapters on:

1. History of Political Ownership and Operation.
2. Questions Usually Asked About Political Ownership and Operation.
3. Authoritative Opinions on Political Operation and the Relation of Government to Business.
4. Municipalities which have abandoned, sold or leased their electric plants to private companies. Municipal distributing systems (where municipalities had no generating plants) sold or leased to private companies.
5. Municipalities which have abandoned, sold or leased their generating plants and are now purchasing power wholesale from private companies, but which still own and operate the distribution systems.
6. Bibliography.
7. Index.

Bound in maroon board covers, lettering in gold. Prices, plus transportation:

1 to 10 — $1.50 per copy
11 to 25 — $1.40 per copy
26 to 100 — $1.30 per copy
101 or more — $1.25 per copy

NATIONAL ELECTRIC LIGHT ASSOCIATION **420 Lexington Ave., New York**

largely, owing to the greater number of industries in which DuPont is engaged.

Eastman Kodak Company

In 1878, when George Eastman, then a young bank clerk in Rochester, became interested in photography, the taking of pictures was not the universal and simple pastime that it is today. These were the days of the collodion or "wet" plant process, when the outdoor equipment consisted of a mule-pack of paraphernalia. The early amateur, after having selected a view and set up his dark tent and camera, had to crawl under his tent to sensitize and load his plates, thrust them dripping into the camera, make his exposures and then creep back again to unload and develop them. The transition from this arduous undertaking to the simple art of taking snapshots as practised today has been accomplished through the experimental development of the "dry" roll film. So that from its very inception the great Eastman Kodak Company has been a product of the research laboratory.

In the case of a company such as this, whose very existence is dependent upon research, the laboratories are the heart of the enterprise. Although investigations have been carried on continuously since 1878, when Mr. Eastman first started his experiments in a little room over a shop, the present Eastman Research Laboratories were first established at Kodak Park in 1912. There are on the staff of the laboratories 140 persons, many of whom are chemists, physicists, and photographic experts of the highest training, several enjoying world-wide reputations.

The actual organization of the laboratories cover practically the whole field of chemistry and physics, as applied to photography, and has in addition a special department devoted to photography itself. The following incomplete list of the subjects of study will give some idea of the ramifications of the work: Sensitomestry, illumination, reflection and absorption, colorimetry, spectroscopy, and geometrical optics, inorganic, organic, colloid and physical chemistry, astronomical and spectroscopic chemistry, photographic chemistry, portraiture, color photography, photo-engraving, motion pictures and X-rays.

An interesting sidelight on the laboratories' activities is furnished by the synthetic organic chemical department, which was started because of the dearth of fine organic chemicals in the United States during the World War. If these chemicals had not been supplied, research along scientific, industrial and medical lines would have been paralyzed. This department stepped into the breach and today has available for shipment from stock more than 2100 different organic chemicals of specified purity.

Another perhaps more popular achievement which is credited to the laboratories' research endeavors is the invention of the 16-millimetre Cine-Kodak Safety Film, and the reversal process which have enabled the amateur to make motion pictures as easily as he takes snapshots. By means of this reversal process, the same film which is exposed in the camera is used for projecting the finished picture.

Often the work leads to the production of interesting by-products. An example of this line of endeavor is the discovery that rubber could be deposited from a liquid suspension by an electric current. This discovery has led to the patenting of a process of electroplating rubber solutions that will undoubtedly be of value to the rubber industry.

While the primary object of the laboratories is obviously the improvement and development of the Eastman photographic products, it is not their purpose to limit investigation along purely commercial lines. Research results are almost always published in the leading scientific journals. Since 1913 nearly 300 such communications, dealing chiefly with the theory of photography and allied subjects, have appeared.

A library containing the most complete collection of photographic literature in the world is maintained by the laboratories with a trained librarian in charge of the 10,000 volumes. Subscriptions are maintained for about 200 American and foreign periodicals, and articles therein are abstracted, classified and collected in a Monthly Abstract Bulletin. Translations are made from foreign publications on request, and the facilities of the library are extended to other libraries, institutions and investigators.

Thus the Eastman Research Laboratories have become a great clearing house for the adjustment of all scientific problems connected with every phase of the photographic industry.

The Association Is Planning

The Greatest Convention of Its History

THE 52nd Convention and Exhibition of the Association gives every promise of providing a memorable and gala week.

The Convention coincides with the 50th year of the invention of the incandescent lamp, which will be commemorated with special observances; the new Atlantic City Convention Hall offers facilities unavailable heretofore for such a convention and exhibition as is being planned; the past year has been particularly fruitful in electrical development and spectacular displays and uses of electrical wonders will be made; but above all, the electrical industry will at this Convention pledge its obligations to civilization and fittingly symbolize its leadership in cultural and economic contributions to the world. To these ends, preparation for the most elaborate, comprehensive and inclusive convention and exhibition ever held by the Association have been under way since the curtain came down last June on the 1928 Convention.

The business sessions are being so arranged that the primary function of a convention to afford the interchange of ideas among its delegates will not be neglected, but rather enhanced. The programs for the several sessions are rapidly assuming shape and included in them will be distinguished speakers drawn both from within and without the industry, and from European countries as well. Look for detailed accounts of Convention plans in the April and May issues of the N. E. L. A. BULLETIN.

The opening date of the Exhibition to be held in conjunction with the Convention has been advanced to Friday, May 31. The Convention dates remain June 3-7 inclusive, the Exhibition to continue throughout this period.

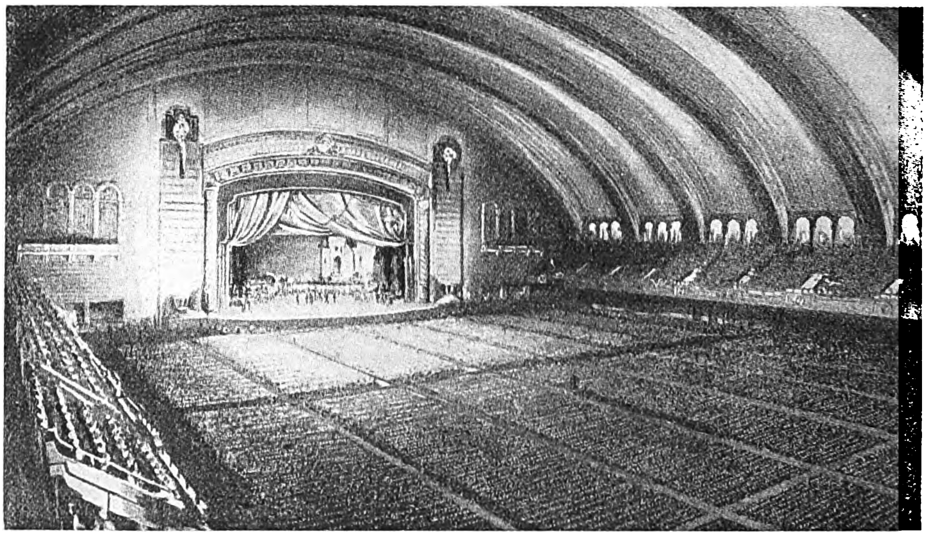
The year 1929 will be celebrated throughout this country as Light's Golden Jubilee, and the opening phase of the celebration will be inaugurated at the N. E. L. A. Convention and Exhibition, with a grand Festival of Light, accompanied by the formal dedication and opening of the new Atlantic City Auditorium on Friday, May 31.

For Atlantic City this will be not only the Golden Jubilee of Electric Light, but also the Diamond Jubilee of Atlantic City as a municipality. The opening of the new $15,000,000 auditorium will be with great pomp and ceremony. Thousands of delegates will arrive in advance of the Convention to participate in these functions, including President Arkwright of the N. E. L. A. and many other electric light and power company executives.

The Festival of Light, beginning Friday, will be conducted throughout the Convention as Atlantic City's contribution to the N. E. L. A. Convention and its program for celebrating Light's Golden Jubilee. A grand inaugural ball in the new ballroom of the auditorium is planned for Saturday night, June 1. The dedication and opening ceremonies of the new auditorium were planned for an earlier period, but have been postponed to May 31 as a compliment to the National Electric Light Association and the electrical industry as a whole.

These social functions and the N. E. L. A. Exhibition will be given wide publicity by Atlantic City, and the railroads are planning to run many special trains to Atlantic City, Friday, May 31, Saturday, June 1, and Sunday, June 2.

With these facts and many details of the program in mind, the Exhibition Committee has therefore unanimously voted to move forward the opening date of the Exhibition in order that exhibitors may take advantage of the unprecedented opportunity to place exhibits before an audience of the general public drawn from all parts of the country. In the two days before the opening of the Convention, the public will be permitted to view a collection of electrical apparatus unparalleled in range and completeness. This will provide an educational opportunity of no small importance to the central station industry and show the public a wide variety of heavy apparatus and appliances which are the very backbone of the generating and distribution systems supplying them with electricity but which they have heretofore had no opportunity to examine.



Main Auditorium of Atlantic City Convention Hall

The exhibition will be staged in this gigantic theatre. It is 350 ft. wide by 650 deep and contains 168,000 sq. ft. of exhibition space on the auditorium floor. The entire permanent population of Atlantic City, 66,000, could be seated in the building—with room to spare

H. M. Byllesby Prize Paper

The Accountant's Place in the March of Progress

By L. W. Clark

THE place which the accountant is destined to fill in the business organization of tomorrow is a subject which at once commands attention and demands consideration. In order to appreciate the underlying truth of this statement it is only necessary to scan the business horizon of today. The trend in modern business is toward larger and still larger business combinations. Undoubtedly, the public utility industry has been one of the pioneers in bringing about this situation. Briefly, the *raison d'être* of these large combinations is the fact that very great savings in the buying, processing and marketing of commodities can be effected in this way. However, these savings will be more than offset by losses if the business organization is loosely managed.

This is the situation which presents a challenge to the accountant. Whether or not the gigantic business organizations of tomorrow are going to justify their existence will depend to a considerable extent on the ability of the accountant to meet the situation. The information which the accountant is able to furnish, by virtue of his training, is as vitally important to the management in shaping business policies as the compass and sextant are to the navigator in keeping his ship on a predetermined course.

Mr. Clark's paper won the H. M. Byllesby second prize for 1927-1928, *awarded last June at the* 1928 *N. E. L. A. Convention, Atlantic City. Mr. Clark is a native of Utica, New York, and after graduation at Colgate University in* 1923 *was employed for two years in New York City He has been with the Utica Gas and Electric Company since January* 1925 *and is at present Statistician of that company*

BEFORE attacking the problem of how to increase the usefulness of the accountant in the public utility industry it will first be necessary to deal with the parallel problem of what constitutes usefulness. By formulating what might be called a yardstick of usefulness it will be possible to measure progress toward the ultimate goal, which in this case is the solution of the above-mentioned problem. This will also lessen the possibility of wandering aimlessly in a sea of suggestions and make it possible to drive steadily toward the objective. In order to accomplish this, it will prove helpful to disregard, for the time being, the business superstructure which embodies all of the complexities of modern business organization, so that attention may be centered on the foundation which underlies all sound business practice.

Upon examination, this foundation reveals itself as being the practice of satisfying wants or rendering services. Before building on this foundation, however, it becomes necessary to study the economic forces which must be complied with if the structure is to attain any size or importance. In the first place, there is a very definite limit to the amount of money which the average person is willing to pay in order to have a certain want satisfied or a particular service rendered. This makes it imperative that the charge made for a service be in proportion to the value of the service. If the service charge is placed at too high a level, the business will not only suffer from a greatly restricted market, but in most cases the way will be paved for a competitor to enter the field and underbid, thereby taking away the business. In the second place, the financial affairs of the company must be managed in such a way as to breed confidence through the assurance of permanence, stability and earning power. Occasionally, it becomes necessary for practically every business organization to seek outside capital in order to meet unusual requirements such as might be due to a period of abnormally small sales or the necessity of providing for additions to plant or equipment. If the financial affairs of the company have been managed in such a way as to assure confidence, there will be no difficulty in obtaining the necessary money. On the other hand, if the financial affairs have been poorly managed, the result will be a lack of confidence and the money will not be forthcoming to sustain the business during the critical period. This will, in turn, lead to bankruptcy or receivership. By keeping these truths in mind it will now be possible to build a large and permanent structure on the foundation which has been provided.

A SUMMARY at this point will help to reveal more clearly the progress which has been made toward determining what constitutes usefulness to the public utility industry. The statement that profits are the life blood of business is commonly accepted as axiomatic. It follows directly from this that the usefulness of any agency in business depends to a very great extent upon its ability to increase the profits of the business as a whole, for the simple reason that the very existence of business depends upon the fulfillment of this condition. In the foregoing material three basic truths of business have been outlined, the observance of which will lead to greater profits and increased business. The success of the public utility industry, as well as any business organization, depends upon the extent to which these truths are emphasized and put into practice. Briefly, these truths are as follows: the rendering of better and more complete service, the control of operating costs so as to provide the service at the lowest possible charge, and the financing of the organization in such a way as to assure the obtaining of additional capital at advantageous rates when business conditions make it necessary.

In as much as it is imperative that business activity and effort be directed toward these three objectives if the profitableness and stability of the organization is to be increased, it can readily be seen that the usefulness of any member of the organization can be very definitely measured by the extent to which he cooperates in this general program. This provides a yardstick of usefulness by which it is possible to evaluate the efforts of any particular part of a large business organization. The problem has now been narrowed down to the determination of what it is possible for the public utility accountant to accomplish, within his sphere of activity and by means of the tools with which his specialized training has provided him, toward helping the management of public utilities to correlate the vast number of activities within the industry and to direct them more wisely and efficiently through the three channels which have been mentioned in order that the industry as a whole may grow in prosperity and stability.

THE providing of better and more complete service presents a number of real opportunities for the public utility accountant to increase his usefulness to the industry in as much as he usually has jurisdiction over Meter Reading, Billing of Consumers, Credits and Collections, Adjustments and the Cashiers. All of these activities have to do with that phase of the business commonly spoken of as public relations and for this reason there is a possibility of doing a considerable amount of good or conversely causing a great deal of damage. It is within the power of the Meter Readers to create an enormous amount of good-will for the company because of the large number of contacts made during the course of their daily rounds. In addition to their duties it is very important that they deal with the customers in a polite and courteous manner. Furthermore, by giving the Meter Readers a short course of training it would be possible for them to answer a great many minor complaints concerning company policy, service rendered, appliance defects, etc. In cases where the problem involved is too complex or the time required too great he could refer the customer to the proper individual or department of the company. This would tend to convey to the mind of the customer the impression that the company is very anxious to provide them with satisfactory service and would have the effect of dislodging from the minds of dissatisfied customers the prejudice which takes root so easily.

With respect to the billing of consumers it is extremely important that accuracy be emphasized. It is very difficult indeed for the average customer to overlook a mistake in billing even if the service rendered is absolutely satisfactory in every other respect. For this reason an added amount of emphasis should be placed on this part of the work. The bill which is mailed to the customer should have the terms of payment printed on it in a conspicuous place. It is also helpful to print on the bill a diagram of the meter dials with a brief explanation of how to read them and a schedule of existing rates. Although this may seem unnecessary it is nevertheless instrumental in establishing confidence in the minds of the customers. The practice of allowing ten days for the payment of bills is generally followed by the utilities. However, there is a difference in the application of this rule. Some utilities have chosen to bill the customer net with the addition of a penalty charge for non-payment within the ten day period while others have chosen to bill the customer gross, with the allowlowance of a discount for payment within the ten days. Although the net result is the same in either case, nevertheless, there is a psychological factor involved which it will be worth while to note in passing.

The judgments of people are very greatly influenced by precedent or established practice. It is a very common occurrence in the business world for a person to be granted a discount for the prompt payment of a bill but it is a very rare occurence for a person to be charged with an amount additional to the cost of the commodity because of the fact that the bill was not paid within a comparatively short period. Very often the latter practice arouses a feeling of antagonism in the mind of the person concerned and although there may be no justification for it whatever, nevertheless, it may be expected with a reasonable degree of certainty. On the other hand, it may be argued that the rate is based on cash within ten days, that the customer who pays his bills promptly should be favored and that it is advantageous from a bookkeeping standpoint to bill the customer net. Nevertheless, the fact remains that billing customers with the gross amount and allowing the discount is a comparatively easy way to build up the confidence and good-will which is worth so much to the company. The management of Credit and Collections is another important link in the public relations end of the business. Here, again, it is very important that accuracy be observed in keeping the records because an immense amount of ill-will can be caused by the failure to O.K. the credit of certain customers who are conscientious in their payments. In connection with adjustments and the work of the cashiers, it is very important that the customers be treated with politeness and courtesy. In managing the work of adjustments it should be borne in mind that although the complaint may seem very trivial from the standpoint of the utility, nevertheless it is probably all important to the mind of the customer.

THE control of operating costs to the end that service may be provided at the lowest possible charge, presents another fertile field for the accountant. By cooperating with the different operating departments it is possible for the public utility accountant to aid them in cutting out unnecessary expenditures. An effective control can be maintained over operating expenses by furnishing a report to the heads of the different operating departments at the close of each month, showing the expenses of the respective departments itemized by accounts as compared with the same month of the previous year. This will call to their attention any radical changes in the cost of operating the departments. The public utility accountant can also increase his usefulness by preparing a number of charts, which are very valuable from the standpoint of management in gaining a more accurate conception of what is transpiring in the operating departments. For example, the operating expenses may be plotted against the sales by means of index numbers, using a normal year or period of years as a base. Somewhat the same results may be obtained by plotting the operating ratios, or in other words, the ratio of total operating expense to gross operating revenue. These charts will tend to show any abnormal increases in operating expenses over a period of years, and these increases in turn may be traced to individual departments. A chart may be prepared showing the investment in plant and equipment per dollar of gross revenue received. This will show whether the gross revenues have kept pace with the increases in investment over a period of years. If the system is overbuilt, this fact will be shown on the chart. Interesting comparisons can be made by showing on this chart comparable figures for other companies or for the country as a whole, as they are published by certain statistical organizations.

IF the management is desirous of obtaining information concerning how efficiently the generating facilities of the system are being utilized, a chart may be prepared showing the variations in load factor over a given period. The points as they are plotted on this chart will show how the average demand over a certain period compares with the peak demand for that period. This information is important because the public utility industry has, relatively, a very large investment, and for this reason it is of vital importance that the equipment be used as efficiently as possible. If the load factor can be increased, this will make it possible to lower the rates and this in turn will result in increased business. The only way by which public utility management can increase the load factor is through the type of new business which is added to the system. For this reason, such a chart should prove valuable to the management in directing the activities of the New Business Department.

Another chart may be prepared showing the different plant factors. This will indicate how the average output of each plant compares with its capacity. This chart will prove helpful to the management in determining how efficiently each of the generating plants is being operated.

FINAL NOTICE
N. E. L. A. PRIZE AWARDS COMPETITION

All papers to be entered in the 1928-1929 N.E.L.A. Prize Awards Competition must reach the Secretary of the Association, 420 Lexington Ave., New York N. Y., before April 1, 1929.

The cash prizes total $1,900, and awards are offered to cover papers on all fields of the electrical industry:

The prizes are:

DOHERTY PRIZE—A gold medal donated by Mr. Henry L. Doherty, president of H. L. Doherty & Company, for the best paper on any subject relating to the electric light and power industry.

HARRIET BILLINGS PRIZE—A cash award of fifty ($50) dollars donated by Miss Jane Eglin, in memory of her brother, the late Dr. William C. L. Eglin, former vice-president of the Philadelphia Electric Company, in recognition of the late Miss Billings' services to the association as secretary in its early days, for the second best paper on any subject relating to the electric light and power industry.

H. M. BYLLESBY ACCOUNTING PRIZE—Cash awards of two hundred and fifty ($250) dollars, one hundred and fifty ($150) dollars, and one hundred ($100) dollars, donated by H. M. Byllesby & Company, in memory of Col. H. M. Byllesby, for the three best papers showing how to increase the usefulness of the accountant in the public utility industry.

MARTIN J. INSULL PUBLIC RELATIONS PRIZE—A cash award of two hundred and fifty ($250) dollars donated by Mr. Martin J. Insull, president of the Middle West Utilities Company, for the best paper dealing with public relations in the electric light and power industry.

JAMES H. MCGRAW ENGINEERING PRIZE—Cash awards of two hundred and fifty ($250) dollars, one hundred and fifty ($150) dollars, and one hundred ($100) dollars, donated by Mr. James H. McGraw, president of the McGraw-Hill Publishing Company, for the three best papers on any engineering or technical subject relating to the electric light and power industry.

JAMES E. DAVIDSON COMMERCIAL PRIZE—Cash awards of two hundred and fifty ($250) dollars, one hundred and fifty ($150) dollars, and one hundred ($100) dollars, donated by Mr. J. E. Davidson, president of the Nebraska Power Company, for the three best papers dealing with commercial or merchandising problems of the electric light and power industry.

FRANK W. SMITH EDUCATIONAL PRIZE—A cash award of one hundred ($100) dollars, donated by Frank W. Smith, vice-president and general manager, United Electric Light and Power Company, to the person making the most creditable showing in the educational courses provided by the National Electric Light Association.

Complete details appeared in the December and January numbers of the N. E. L. A. Bulletin. If these issues are not available, full information will be mailed upon request to the Secretary, National Electric Light Association.

Other charts may be prepared which will help the management in visualizing what changes have taken place in connection with the sales of electricity and gas. For example, a chart may be prepared showing the variation in the different sales classifications over a period of years. This in turn may be divided so as to show the variations in both the kw-hr. sales and revenues by classifications for the electric department and the MCF sales and revenues by classifications for the gas department. Another chart may be prepared showing the variations in the average rate received for each of these sales classifications. These charts taken collectively will enable the management to obtain a very clear-cut conception of what changes have taken place in the different operating departments as well as providing a satisfactory sales analysis.

The next problem to be dealt with is in connection with the financing of the business. Because of the relatively small earnings of public utilities it is practically impossible to appropriate enough money from earnings to provide for very extensive additions to plant and equipment. This condition makes it necessary to obtain large sums of money through the sale of stocks and bonds. Consequently the payment of bond interest and stock dividends requires a relatively large portion of the net earnings. Recently, the public utility industry has been doing a considerable amount of financing through the sale of preferred stock, of which a large portion has been of the cumulative variety. This type of security finds a ready market because of its appeal to a large number of investors who are conservative in their buying.

WHEN it becomes necessary for a public utility to sell securities in order to obtain additional capital, it is very important that a wise choice be made with respect to the kind of security to be issued so that a sound financial structure may be maintained at all times. The bond holders, considered collectively, are in possession of a mortgage on the property. This means that as soon as a public utility is unable to pay its bond interest there is grave danger of receivership or bankruptcy. For this reason it is necessary to keep the amount of bonds issued within certain definite limits so that the smallest earnings which may reasonably be anticipated will be ample to care for the bond interest. It is also true that a public utility cannot pass dividends on its preferred stock without serious consequences. Although it is more important that the bond interest be paid, it is nevertheless true that if the cumulative preferred stock dividends, or even the non-cumulative preferred stock dividends, are not paid for a considerable length of time a serious situation will develop. The investing public will lose confidence in the business and it will be extremely difficult to float any new securities on the market. In order to maintain a strong financial position, it is necessary that the holders of the common stock absorb any variations which may occur in net earnings due to changing business conditions.

More Electricana

AT LAST A SATISFACTORY DEFINITION

Electricity is something that starts the Lord knows where and ends in the same place. It is 1/36 of a second faster on its feet than its nearest competitor, backyard gossip, and when turned loose in Europe will get to the United States five hours before it starts. Nobody knows exactly what it is because it has never stood still long enough.

Electricity is sometimes known as science gone crazy with the heat, and if you can understand its manoeuvres you can do anything with it except open a can of peanut butter at a picnic.

Electricity was locked up in ignorance for centuries until Ben Franklin let it out with a pass key, and since then it has been pulling off more new stunts than a pet monkey.

With it you can start a conversation or stop one permanently, cook dinner, curl your hair, press your trousers, blow up a battleship, run an automobile or signal Mars, and many more things are being invented.—*New York Utility Bulletin.*

To Be Set to Music
ELEC

Elec, do the washing,
Elec, press my clothes,
Elec, whatever are you,
Goodness only knows.

Elec, start the refrigerator,
Elec, freeze some cream,
Elec, you shocking creature,
To touch you makes me scream.

Elec, cook my dinner,
Elec, curl my hair,
Elec, when I reach for you,
You are right there.

Elec, turn the fan on,
Elec, now some heat,
Elec, you're so swift it seems
You have a million feet.

Elec, turn the lights on,
Elec, the radio,
Elec, when I'm without you,
My gladness turns to woe.

—Gertrude Totten *in A.G.E. Bulletin*

* * *

Elec, take a message
Half the world around.
Elec, through the ether,
Carry sight and sound.

Elec, run the smelter;
Gold from dusty ore.
Elec, heat the furnace,
Whence our wealth shall pour.

Elec, willing servant,
Aid in home and farm.
Elec, housewife's helpmate,
Clean and freeze and warm.

Elec, docile giant,
Turn the wheels of trade.
Elec, drive the motors,
Mass production's aid.

Elec, angry Titan,
Scourge of ancient Jove.
Elec, safely harnessed,
Gentle as a dove.

Elec's work is never through,
In home and shop and mine.
Elec's seeking more to do,
Mystic force benign.

—W. M. C.

HERE again the accountant may increase his usefulness to the industry by furnishing the management with data and charts by which it is possible to ascertain very quickly and accurately the financial condition of the company at any given time. For example, a chart may be prepared on which is plotted the income by months after operating expenses have been deducted. Against this may be plotted the requirements for bond interest and likewise the requirements for preferred stock dividends. This chart will show very strikingly the difficulty encountered in meeting these requirements. Another chart may be prepared showing the earnings on common stock and plotted against it the amount of dividends which have been paid on common stock. This chart will show at a glance the amount earned on common stock, the relative amount of earnings paid out in dividends on common stock or vice versa, the relative amount drawn from surplus with which to pay dividends. A chart may be made showing the disposition of the gross income between interest on notes, bond interest, preferred stock dividends, common stock dividends, surplus or any other items such as amortization which may be deducted from the gross income. This chart will show the relative amount of gross income consumed by each of these items, and if the financial structure is poorly balanced in any way, this fact will be shown very noticeably on the chart. Still another chart may be provided showing the rate of return on investment. This may be obtained by dividing the net earnings by the amount of money invested. The amount of the investment may be determined with a fair degree of accuracy by adding to fixed capital a representative figure for accounts receivable, a like amount for materials and supplies and an estimate of the working capital required, sometimes computed on the basis of forty days' operating expense. This chart will show with reasonable accuracy the rate of return which has been earned on the money invested in the business. The charts which have just been mentioned will make it possible for the accountant to increase his usefulness by providing the management with a great bulk of accounting information in a very concise and usable form. With this information at hand, the management should be able to conform more closely to the third fundamental of business practice as it has been outlined in the preceding paragraphs.

THE public utility industry of the future must necessarily be a creation of the mind. It will be shaped and molded by different forces as time moves onward and business conditions change. Out of the chaos and confusion arising from these ever-changing conditions, one factor may be discerned which is always present and is conspicuous because of its steadfastness and inflexibility. This factor is the spirit of progress which is constantly at work in shaping business organizations. This is the motive power behind the ever-changing methods of the business world. The most valuable business men of today are those whose thoughts and actions are not restricted to the business practices of today, but who have the courage and vision to anticipate the goal toward which the march of progress is taking them. The anticipation of this goal requires a careful and thorough study of the fundamental economic laws which govern business. This fact has made it necessary to outline at the beginning of this article certain economic forces which must be dealt with if the public utility accountant is to increase his usefulness to the industry. Following this a number of suggestions have been made in order to show how the accountant may direct his efforts in such a way that they will be in closer harmony with these forces. The public utility accountant who places sufficient emphasis on these truths will be able to anticipate the trend of business progress, and in this way greatly increase his usefulness by helping his industry to attain a higher level of profitableness and stability.

Electric Heat: *An Economic Paradox?*

By B. S. Havens

General Electric Company

THE tremendous rate of increase in the use of electric heat in industry during the last few years has stimulated an interest in a subject which, upon investigation, discloses a number of curious facts. Those who are unfamiliar with the details, but who are, nevertheless, acquainted with the cycle through which the electric energy passes, are likely to think they see in the use of electricity for this purpose an economic waste.

Were the cost per heat unit the only factor to be considered, electric heat would, without question, be an economic paradox, to be discarded by a modern business man as quickly as he would discard a suggestion to use perpetual motion in his manufacturing processes. And yet, by reason of other advantages, electric heat is frequently found to be cheaper, from a standpoint of overall cost, than any other form of energy.

Electric heat should be considered a tool in industry much as is the hammer, the saw or the drill, and as such it should be analyzed and its merits weighed. The most important advantages, then, of this electric heat tool, are as follows: High quality, close control, simplicity of application, cleanliness and improvement of working conditions, flexibility and, finally, the possibility of lower overall costs. Cases where all these advantages are combined in one installation are not rare, yet seldom is more than one or two of them necessary to influence the choice.

WANTED
A Slogan
to
Promote
ELECTRIC HEAT

Seven prizes, totaling $500, will be awarded by the National Electrical Manufacturers Association and the National Electric Light Association for the best slogans to promote the use of electric heat in industry.

Each contestant may submit not more than three slogans and each slogan must be accompanied by an analysis not exceeding 100 words. Preference will be given to brevity in slogans. The awards will be made on the basis of the best slogan and analysis. First prize will be $250, second $100, third $50, and four of $25 each.

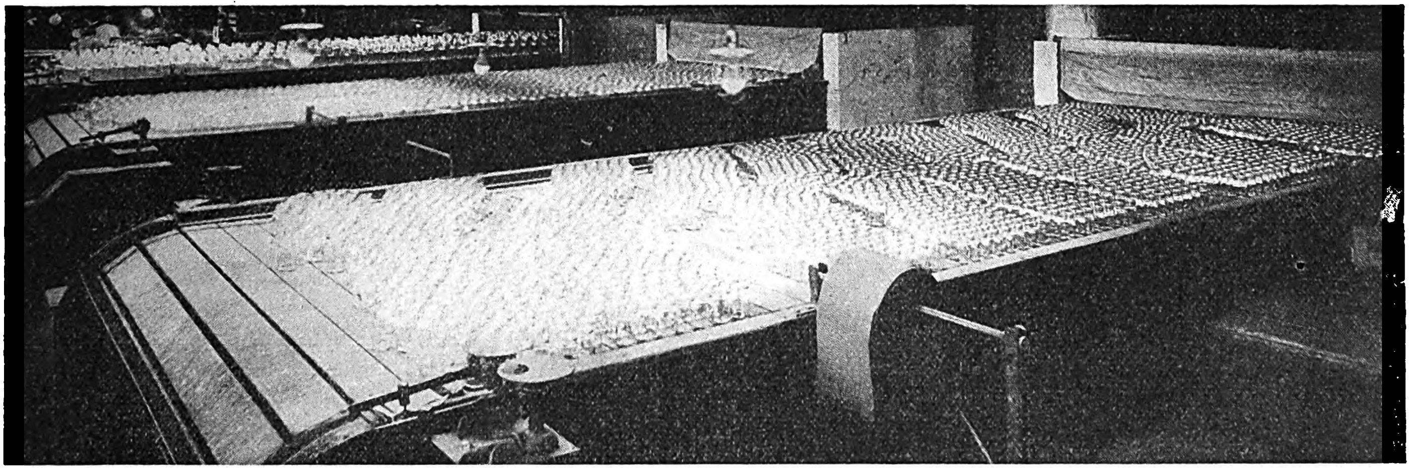
Slogans should be broadly descriptive of the possibilities and advantages of electric heat in industry.

Contestants should submit each slogan and its accompanying analysis on a separate sheet. The contestant's name and address should appear *only* on the outside of the envelope which should be addressed to "NEMA—NELA Slogan Contest, National Electrical Manufacturers Association, 420 Lexington Ave., New York City." Slogans must be mailed before midnight, May 30, 1929, at which time the contest closes. Results of the competition will not be made public before June 30, 1929.

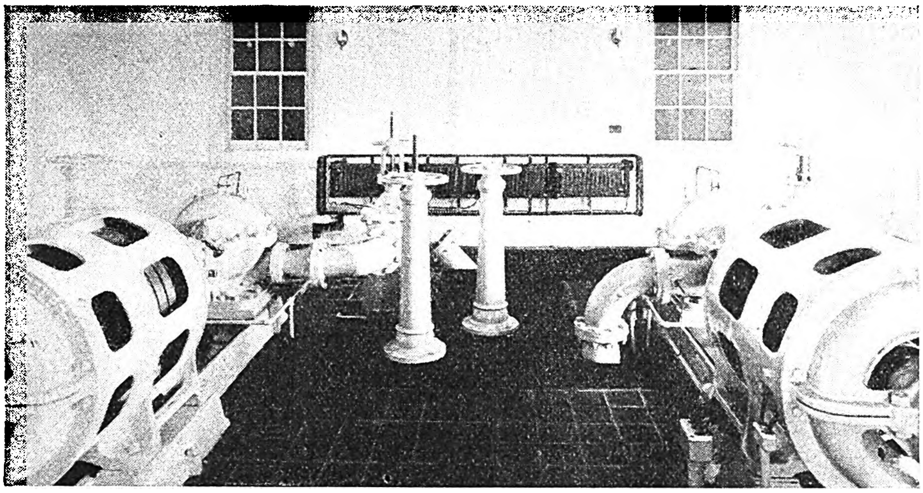
It is suggested that N. E. L. A. members inform their industrial customers of the details of this slogan contest. The resulting publicity on the wide applicability of electric heat in industry will prove mutually beneficial.

An example directly at hand involves the printing industry, without which this periodical could not be published. The type forms from which this page was made are cast from stereotyped metal maintained in a molten state in what are known as stereotype melting pots. A year or so ago the common means of reaching and maintaining the necessary heat was, gas. Then the Waterbury *Republican-American* tried electricity. The gas-heated pot which had been used consumed approximately 131,000 cu. ft. of gas per month at a cost of $1 per thousand cubic feet, making a total of $131 per month for fuel. The new electrically heated pot was found to consume an average of 8000 kw-hr. of electricity per month, costing 1.25 cents per kilowatt hour, reducing the monthly fuel cost to $100, or an immediate saving of $31 per month.

One of the most important advantages resulting from this installation, however, was found to be the ease and simplicity of operation. In the original installation, with gas heat, it was necessary to maintain a continual close watch of the metal. When the pot was not in use it was customary to hold the temperature at about 450 deg. Fahr. in order to bring it up to the operating point as quickly as possible



Rear view of battery of three electrically heated glass lehrs, heating chamber of each lehr 9 ft. wide, 50 ft. long by 2 ft. high—240 kw. per lehr maximum operating temperature 1200°*F.—Illinois Pacific Glass Co., San Francisco, Cal.*



Automatic pumping station, heated automatically by 3.8 *kw. electric air heaters, total installation* 30 *kw.,* 440 *v.,* 3 *phase. Town of Morristown, N. J.*

when necessary; with electric heat this was accomplished automatically by means of an automatic control panel and a thermostat with a sensitive bulb in a well in the pot. Little more than a half-hour was found to be needed to bring the metal from the stand-by temperature of 450 deg. Fahr. to the operating temperature of 620 deg. Fahr.

Where high quality product is an important factor in any manufacturing process involving the use of heat, electricity brings very gratifying results. One manufacturer of glass bottles installed electrically heated lehrs for annealing, but also continued to use his older fuel-fired lehrs. He soon found that his customers were insisting on one grade of bottles, and an investigation disclosed the fact that these bottles were invariably those annealed electrically. The close control resulting from the use of this method allowed the manufacturer to cool the bottles more uniformly and at a definite rate, eliminating the possibility of strains set up in the bottles which would allow easy breakage. In addition, operating economies of the electric equipment were found to compare favorably with those of the old equipment, and maintenance charges were negligible.

Often a set of circumstances will exist which practically demand the use of electricity for generating heat. For instance, an Illinois coal company provides bath water for its employees. A steam-heating system was employed to heat the water to the proper temperature, and is still used on work days. This requires about five tons of coal per day and the services of three firemen for its operation. Because of the necessity for the employment of maintenance and construction men, this system had to be kept in readiness on idle days and holidays as well as on working days, and at no reduction in cost over the expense of operation on working days.

As much less water was needed on the "off" days, it was decided to try electricity for heating the water. An electric heating system was therefore installed. By means of this the water reaches bath temperature in three minutes after the current is turned on, and thereafter meets, without delay, all holiday demands. It was found that the cost of steam operation was $34.25 per day, while that of electric heat, used on idle days, is only $7.64, resulting in a decided saving. The steam expense, of course, included the cost of five tons of coal and the wages of three firemen.

Sometimes electric heat serves odd purposes. A manufacturing company in Pennsylvania wished to serve a turkey dinner to its employees and, casting about for a means of cooking the turkeys, hit upon the idea of using an electric annealing furnace in its plant. The temperature control was set at 405 deg. Fahr., the furnace preheated and the birds put in. Satisfied diners reported that the birds were perfectly cooked.

The fact that electric heat can be applied automatically has much value. The town of Morristown, N. J., has an automatic pumping station, located at some distance from the town, for maintaining water supply. As the building is located in an exposed position, it was found there was constant danger of freezing the pumps in winter weather, and thus interrupting the supply of water. An installation of electric heaters was made, together with a system of temperature control, and now a constant temperature of 50 deg. Fahr. is maintained automatically even when the outside temperature falls to 10 degrees below zero. This method has also been successfully applied by other municipalities and by public utilities.

One of the great advantages in the use of electric heat is the ability to

Design of High Voltage Outdoor Substations

PART IV

(Conclusion)

A series of six discussions on design of outdoor substations originally presented at a meeting of the 1926-1927 Electrical Apparatus Committee, Engineering National Section, H. R. Woodrow, chairman. The meeting at which these discussions were presented was conducted by the Substations Subcommittee under the chairmanship of R. A. Hentz.

Substations discussed in this series are: The Philadelphia Electric Company, by Raymond Bailey; Detroit Edison Company, by S. M. Dean; (December, 1928)—Commonwealth Edison Company, by B. G. Jamieson; Pacific Gas & Electric Company, by B. D. Dexter; (January, 1929)—Duquesne Light Company, by G. Sutherland; (February, 1929)—Alabama Power Company, by L. M. Smith (this month).

◆

ALABAMA POWER COMPANY

L. M. Smith

IN the design and construction of outdoor substations to serve widely separated industries and communities we have found it necessary to give serious consideration, first, to the use of automatic equipment, second, to the standardization of structures, buildings, fences, ground systems and certain kinds of equipment, and third, to rigid inspection.

Our engineering organization as far as it affects the construction of substations, is divided into five sections, each of which have a managing head who reports directly to our Electrical Engineer. These five sections are: (1) Primary Substations, (2) Customers Substations, (3) Transmission Lines, (4) Distribution Lines, and (5) Com-

munication, and every substation of importance requires the cooperative effort of all five. Each of these sections have engineers who follow one or more jobs closely and who prepare specifications from which our design and drafting sections work. These engineers also send out inquiries for bids on equipment, analyze the bids and recommend purchase.

A new 110,000 volt substation costs anywhere from $100,000 to $400,000 depending on the amount and capacity of the equipment to be installed. Before any construction plans are prepared the engineer in charge of the job prepares a rather complete set of general specifications according to a standard outline. The use of these general specifications is three-fold; first, as a contract between the Engineering and Operating Departments that certain work will be performed, second, as a guide to the Designers for the preparation of plans, and third, as a guide in the checking of plans and the writing of the Working Specifications for the Construction Department.

The outline for these general specifications follows closely that used in the Standard Classification of Accounts for Primary Substations. For example, the outline we use starts in with the clearing of the substation site, then the grading and draining, the railroad siding, roads, fences, water supply, outdoor and indoor equipment, then buildings such as the switch-house, cottages, garages and pump house. Everything of importance that must be considered in

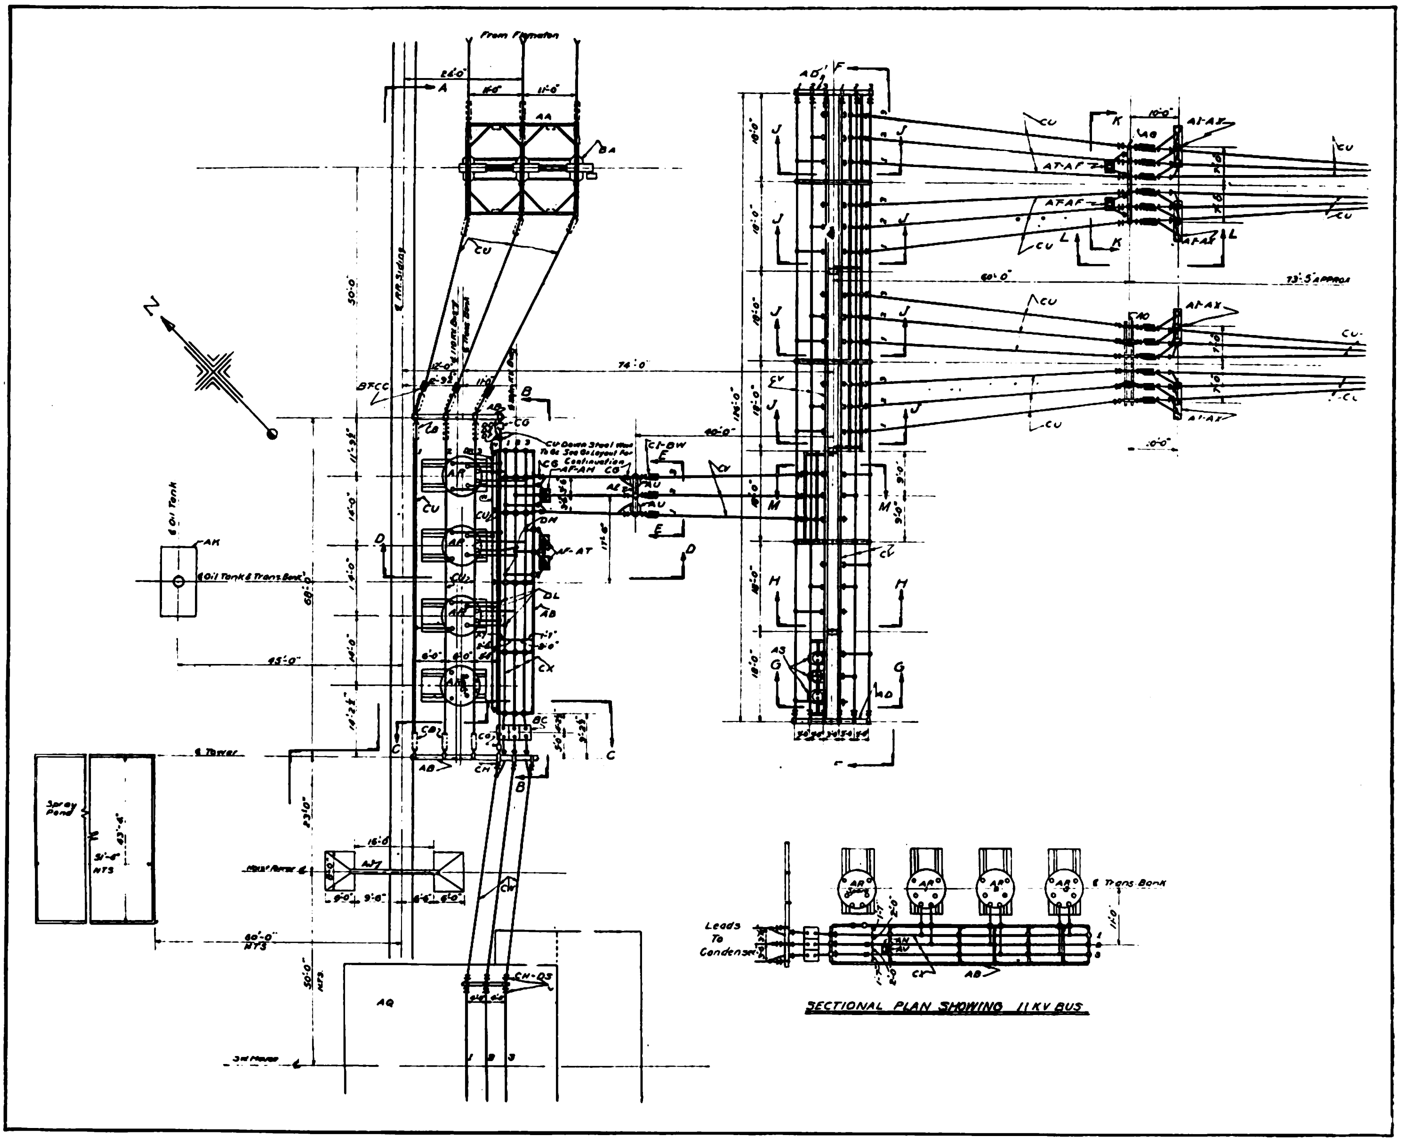

Fig. 36. Plan View—Mobile Substation. Alabama Power Co.

the station layout has some mention made of it. One advantage of this outline is that all the important features of the station are before the engineer for whatever thought and attention they deserve and there is no excuse of an oversight nor is there any excuse for

the designer misinterpreting the requirements. If, in the outline, some item is mentioned that does not apply at a given station that item is set down in the specifications with the statement that it does not apply.

Another advantage of the outline and the complete specifications it presupposes is in its benefit to the estimator. There need be little guess work on his part when his specifications are complete and they should be complete because curves of costs per kv.a. have practically no value in high tension substation work. Each station must have its own estimate and where that station is part of a project costing hundreds of thousands or perhaps several million dollars, the management does not want guesses or amounts taken off some set of curves.

Fig 47. Typical 44 Kv. breaker arrangement. Alabama Power Co.

The cost of high tension substations on a far-flung transmission system is an appreciable figure in the overall cost to serve. Therefore, every economy that can be effected by careful engineering has to be made use of if many extensions are to be justified. Automatic equipment, standardized practices and rigid inspection point the way.

Service Suggestions
NATIONAL ELECTRIC LIGHT ASSOCIATION — COMMERCIAL NATIONAL SECTION
CUSTOMER RELATIONS COMMITTEE
H. T. EAST, *Chairman*, Public Service Co. of Northern Illinois, Chicago, Ill.

To formulate efficient methods of conducting relations between the customer, the public and the supply company, including such matters as taking applications in the office, forms, order routing, inquiries, complaints, meter reading, collections and credits

No. 68 March, 1929

Records That Speed Service

By H. T. East

Public Service Company of Northern Illinois

RECORDS are necessary to the proper conduct of any business. Because of the nature of the utility business and the several phases of modern light and power company operation, the records required are many and varied in character. Those records which are identified with the individual customer and are often referred to in dealing with him are quite important from a customer relations standpoint. The purpose of this writing is to suggest some of the advantages which accrue when all information pertaining to the customer is consolidated on a single form. Since record keeping problems are dealt with by Accounting Section committees, the intention is to treat it herein solely from a customer relations point of view.

Because of the wide range of information which might be included on a customers' service record and the limited space available, there is a considerable difference of opinion as to what information properly belongs on such a record. The size of the company, company policies and methods of operation must be considered in arriving at a decision. Many different plans are in use.

System of San Antonio Company

Mr. Z. L. Pape, Superintendent, Application Department, San Antonio Public Service Company, San Antonio, Tex., describes a system employed by his company to speed up service to customers.

"The San Antonio Public Service Company," says Mr. Pape, "has approximately 98,000 meters in service. In the installation of new service, turning off or cutting in service, recording changes of occupancy, and other transactions affecting these meters, the application department handles more than three hundred orders each day. In the year 1928 over 92,000 such orders were handled.

"The volume of orders in this department had so increased that some new system for keeping a record of

all meters in service was found necessary. After considerable research and study the plan we now have was adopted and placed in use four years ago. As a result of the new arrangement, more than 92,000 orders and requests accepted last year were handled with a minimum of effort and confusion. Such a condition is highly desirable in the public utility business today.

Advantages of the Present System

"Our record system is simple, practical and economical. Following the initial equipment no additions are required except as the growth of the business demands. The record cards used are easily understood and provide an up-to-the-minute history of every installation on our lines. From them it can instantly be determined whether service is available at any address.

"This customer service record assists us in issuing orders to the operating department, by determining the nature of every order before it is transmitted, showing whether it is an old set, new set, turn on, turn off, or exchange of tenant; it eliminates 'call backs' and makes possible the execution of all orders by one crew instead of two, as was previously required. Since we operate a combination gas and electric company, it was formerly necessary to send a gas man and an electric man to every house where the customer ordered both gas and electricity. At the present time the electric metermen handle all turn-on, turn-off and change of tenant orders, both gas and electric. Thus it may be seen that a record such as this is both efficient and profitable in operation because it eliminates the necessity of two men calling at the same house.

Time Saving Arrangement

"Our visible house record is made up on cards filed in trays, each tray having a capacity of seventy-five cards. New trays and compartments can be added to the file as needed. Cards are filed alphabetically according to street and number. On this card is a complete record of all the work executed at that address for several years back.

"The filing cabinets are located near the application counter where they may be readily referred to. Below the card trays and integral with the equipment are steel shelves which may be pulled out and used when entries are made.

"The pockets into which the cards are inserted are constructed in such a manner that a card may be placed in either front or back. In this way provision is made for both gas and electric service records or the other card can be utilized for recording information of other character."

Other Customer Record Systems

In a majority of companies the records which pertain to the customer are kept by the several departments, each being concerned only with matters which it handles directly. When detailed information is desired concerning a certain customer, it is necessary to search through the files of several departments and collect the desired information. This lack of concentration is most keenly felt when a customer is waiting for information concerning his installation or account, since the delay involved is naturally greater than would be the case were all records combined on one form.

Although local conditions will largely dictate the type of record best suited to each situation, a plan of providing a customers' service record with space for entering thereon all pertinent information concerning the individual customer has much merit, and the adoption of such a system will prove useful in speeding up service to customers.

Customer Relations Value and Use

Considered from a customer relations point of view, customer service records of the kind outlined have much to recommend them. All information pertaining to the customer is concen-

trated at one point. The facilities for quickly handling customer inquiries are greatly improved. Data on each address and each customer is made quickly available and a complete history of relations with each customer is provided. The time of customers who visit or telephone the company for information is saved and information is instantly available for the use of other departments when desired.

Conclusion

A unified customers' service record aids in promoting promptness and efficiency in serving customers. The experience of companies using such records indicates that the cost is justified by the results obtained. One objection which is frequently raised to the adoption of such a record is that it adds to the number of files which the company must provide and maintain. The facts are, however, that a well chosen customers' service record concentrating the work of filing and entering the number of separate records which the company maintains, the filing and recording expenses may be actually reduced.

Since records containing details concerning the customer and showing a history of his account greatly aid in controlling future contacts, they are of great value in customer relation work. A well planned customers' service record is desirable for utility companies, and the adoption of the idea will mutually benefit customers and employees as well as the company itself.

Service Suggestions serve their intended purpose only when the ideas and suggestions they carry are put to work. Many companies make it a point to provide all department heads with copies of each issue. Additional copies in leaflet form are available at a nominal price and may be ordered direct from the Chairman.

H. T. EAST, CHAIRMAN
1427 Edison Bldg., Chicago

What They Say About

THE ELECTRIC LIGHT AND POWER INDUSTRY IN THE UNITED STATES

A Handbook of the Electrical Industry Compiled by Public Speaking Committee, Public Relations National Section

The Georgia Power Company has thought well enough of this book to purchase sufficient copies to place them in the hands of all of our officials and department heads. We have also made them available to interested employees. Copies also have been supplied to a number of our larger customers, libraries and similar organizations outside the Company. We consider this worthwhile as a means toward educating our own employees and the public generally as to the true facts about the industry.

P. S. ARKWRIGHT,
GEORGIA POWER COMPANY

Two of our employee agencies for self-improvement are utilizing the handbook as text in their activities and making an intensive study by chapters. Others will similarly use the publication as a basis for study and expression.

C. W. DAVIS,
DALLAS POWER & LIGHT CO.

Although I have a very exhaustive file of lecture material upon which to draw, I find that the Speakers' Handbook is a valuable check upon this material for reliability, and it often gives me most helpful suggestions for the planning of public addresses.

L. D. GIBBS,
THE EDISON ELECTRIC ILLUMINATING CO. OF BOSTON

We have placed it in the hands of all our local managers with instructions that they use it as frequently as possible when seeking information about the electric light and power industry.

The Handbook is really an encyclopedia on the subject. It is well arranged and well written and in my estimation a book that could be used profitably by every electric power company in the country.

L. B. HERRINGTON,
KENTUCKY UTILITIES COMPANY

We have distributed the Speakers' Handbook to all of our officers, division and district managers and department heads. In addition we are using this booklet as a text book in all employees' educational meetings.

G. C. NEFF,
WISCONSIN POWER & LIGHT COMPANY

We have used copies of the Speakers' Handbook ever since the first ones were published and have found them invaluable in our public speaking activities. We were so pleased with the last copy that we ordered a sufficient number to place at least one in each of our offices. In some cases more than one was sent to each manager.

Not only is this book used for public speaking, but we have found it of considerable value in reference work. We have turned to it many times for information and have found it at all times containing something of value.

A. E. SCOTT,
INTERSTATE PUBLIC SERVICE COMPANY

We distributed 200 copies of the handbook, "The Electric Light and Power Industry in the United States," to employees of our Company, as we feel that the information contained in it is of unusual value to employees of a utility company.

We are confident that the handbook has been studied carefully by most of our people who received it, as from time to time reference is made to sections of it, especially during meetings of our employees and where papers are being prepared on the utility industry.

J. PAUL CLAYTON,
CENTRAL ILLINOIS PUBLIC SERVICE COMPANY

INTERPRETATIONS of ELECTRICAL DEVELOPMENT

BY STATISTICAL RESEARCH DEPARTMENT, N.E.L.A.

H. A. SNOW, *Chairman, Statistical Committee, Accounting National Section*
H. S. BENNION, *Director of Engineering, N. E. L. A. Headquarters*
WM. M. CARPENTER, *Research Statistician*
MERLE RAINEY, *Assistant Statistician*

The Statistical Research Department of the National Electric Light Association will issue monthly, in this section, basic statistical information on the electric light and power industry.

The Department regularly receives comprehensive annual and monthly reports from the larger member companies of the Association, whose total business represents 80 per cent of that of all electric light and power enterprises in the United States. In addition, the Department consults and cooperates with other sources of information. Statistical research and analyses are continually in progress. The Department's bulletins will be authoritative.

Member companies are invited to make the fullest use of the statistical bulletins of this Department, published separately, as well as of the current statistical information in the N.E.L.A. BULLETIN, and to more fully utilize the services of the Department.

Monthly National Statistics of the Electric Light and Power Industry

The data here presented are for the total (100 per cent) electric light and power industry and are based on monthly reports received from some 380 companies, representing about 80 per cent of the industry.

	1928	(See Note)	Percent Increase

Percentage of Farms With Electric Service

THE Association is now receiving sufficient data regarding farm service to make possible an estimate of the number of farms being served by the electric light and power industry by States. These farm statistics, although difficult to obtain, are in very great demand and it is hoped that all companies reporting regularly to the National Electric Light Association will make arrangements so that these data can be obtained for all States.

The information is being summarized and an estimate made as quickly as the State information is received. The table at top of next column shows the farm service for a few States for which a good coverage was obtained.

Farms Served on December 31, 1928

State	As Reported to N.E.L.A.	Estimated Farms Served	Number of ALL Farms	Per Cent Served
Wisconsin	11,630	18,000	193,155	9.1
Illinois	11,896	14,000	225,601	6.2
Michigan	11,081	14,000	192,327	7.0
Maine	5,966	8,400	50,033	16.8
Texas	4,752	8,000	465,646	1.7
Minnesota	3,538	6,400	188,231	3.4
Nebraska	1,344	2,700	127,734	2.1
Oklahoma	1,152	2,000	197,218	1.0
Louisiana	1,047	1,300	132,450	1.0

Source of Information

The number of farms served as estimated by the N.E.L.A. Statistical Research Department are based upon the returns from companies reporting in these States. The total number of all farms is taken from the Census of Agriculture for the year 1925.

The cooperation of all reporting companies will make it possible to complete this list so that it will cover all States.

Method Employed for the Setting up of Farm Service Records.

In order to make available to reporting companies methods employed in setting up the necessary records for the reporting of the item of farm service, six of the companies who have recently begun reporting this item have been asked to give us the method which they employed.

Mr. Harry A. Snow, Assistant Controller of the Detroit Edison Company, reports the method of that company as follows:

> "The Detroit Edison Company has no rate schedule applying particularly to farm service; farm customers are served under the regular residence rate or under one of the power rates.
>
> "To secure a segregation of earnings, sales, and customers for farm service, the Company had its meter readers place a check mark on the meter reading slip whenever they found that a customer whose meter they read qualified as a farm customer under the Census Bureau definition. The information conveyed by the check marks was transferred to the meter reading ledgers, each ledger sheet for a farm account bearing a special farm symbol.
>
> "In summarizing the earnings from each class of service, a special class was made for the sheets bearing the farm service symbol."

The definition of a farm as defined by the U. S. Bureau of Census is:

> "A farm is any tract of land of three or more acres used mainly to produce agricultural products, or any place of three acres or less, where the owner or tenant devotes his entire time thereon to agriculture."
>
> NOTE: Poultry and game raising, floriculture and horticulture and similar pursuits fall within this classification.

Developed Water Power of the United States

THE United States Geological Survey has recently made public its annual compilation of the developed water power of the United States, as of the first of the current year. In its summary, the Survey states:

"The total capacity of water wheels installed in water-power plants of 100 hp. or more in the United States on Jan. 1, 1929, was 13,571,530 hp., an increase of 1,275,530 hp., or 10.4 per cent, during 1928. The increase in 1927 was only 575,000 hp. The gain in 1928 was, therefore, more than twice that during 1927.

"Water-power development is apparently proceeding without being handicapped by the keener competition caused by the remarkable advance in the efficiency of fuel-burning plants since 1919. It is probably true that the time may not be far distant when the construction of water-power plants will be restricted by the advantages of modern steam plants, but the increase in the developed water power in recent years apparently indicates that this time has not yet arrived." *

The accompanying table sets up a comparison between the total horsepower in service in each State on Jan. 1, 1929, and on the same date a year before. During the year the total water power developed in the United States increased by 1,275,530 hp. Of this net growth, the equipment in public utilities and municipal plants increased by 1,347,955 hp., while that installed in manufacturing plants declined by 72,425, this decrease being largely accounted for by various mills which ceased to function as industrial enterprises and became public utility power plants.

Interesting comparisons are afforded by a study of the details of the increases in total capacity in the various States. Maine, for instance, has remained practically stationary in spite of the Fernald law designed to encourage the development and use of water power at home. Maryland shows the largest increase, largely accounted for by the completion of the Conowingo project. North Carolina, Alabama, and California show extraordinary growth in hydro-electric developments. In some of the States the installation of water power has actually declined, largely as the result of the abandonment of numerous small, isolated plants and their replacement by service from widespread interconnected systems.

Water Power Developed in the United States During 1928

(Plants of 100 horsepower or more, as reported by the U. S. Geological Survey)

---

*Editor's note: In connection with the foregoing statement, account should be taken of the long time interval elapsing between the inauguration of plans and the final completion of large hydro-electric projects. Five years hence, the effect of steam competition should be much more pronounced.

Electrical Production in Canada

APPARENTLY small, isolated plants in Canada are being rapidly supplanted by large central generating stations and interconnected systems just as they are in the United States, according to a report published by the Dominion Bureau of Statistics with the authority of the Minister of Trade and Commerce. During the past five years the output of electric energy from central electric stations in Canada has almost doubled and during the past six years it has increased by 136 per cent. In 1928 the large stations, which report monthly and which produce over 99 per cent of the total of all stations, generated 15,899 million kilowatt hours. This was an increase of 11 per cent over the 1927 output and of 96 per cent over the 1923 output.

During 1928 the exports of electric energy to the United States amounted to 1,587,710,000 kilowatt hours, or approximately one tenth of the total production. This export included 454,156,000 kilowatt hours of off-peak power developed by the Niagara stations.

Practically all manufacturing industries in Canada are operating their machinery either partially or wholly by electricity, which is largely purchased from central electric stations. The data for 1926, which is the latest available, shows that 69 per cent of the power equipment in manufacturing industries other than central electric stations is electrical, or, in other words, the total rated horsepower of electric motors in Canadian manufacturing industries is 69 per cent of the total power used by these industries and 82 per cent of these motors are operated by power purchased from central electric stations.

Although many of the smaller industries use electric power exclusively, the automobile, cement, paper goods and printing and book binding industries were the large industries showing 100 per cent electric power. Several others, however, were above 85 per cent electrified. Electrical apparatus and supplies shows 97 per cent, brass and copper goods 96 per cent, rubber goods 94 per cent, railway rolling stock 91 per cent, machinery 80 per cent, printing and publishing 88 per cent, sugar refineries, hardware and tools, and shipbuilding and repairs all show 87 per cent and castings and forgings 86 per cent.

An Evaluation of "1928 Prosperity"

WHILE the preliminary figures of the demand for electric power during the year 1928 show a substantial increase over 1927, they indicate that the "normal increase in demand" is doing little more than holding its own, according to an economic analysis of the output of electrical energy made by the Statistical Research Department of the National Electric Light Association. Using the figures reported by the United States Geological Survey, it is apparent that while the growth of the use of electricity suggests considerable gains in industrial activity in some states, there has been a marked hesitancy in others and an actual recession in a few.

Preliminary figures gathered by the Survey show a total output of electricity for the year 1928, by all agencies which contribute to the public supply, of a little less than 88 billion kilowatt-hours. While this is an increase of approximately 7½ billion kilowatt-hours over 1927, or 9.5 per cent, it cannot be said to represent anything more than the normal growth of the light and power industry, to which might be added a slight—and irregularly distributed—increase in the activity of industry and trade in the United States.

Analyzed by the various economic divisions of the country, the individual rates of increase in the use of electric energy present several striking contrasts and emphasize the trends in business and industry which are taking place. Considered in the light of what has been designated as an "exuberant financial market" and "the boiler plate prosperity of 1928," these analyses are significant.

New England, as a whole with an increase of 8.6 per cent, falls but little short of the national average and reflects, in large measure, the recovery of industry in this section.

The *Middle Atlantic* States (with which there are here included Delaware and Maryland) show a growth of 8 per cent when taken as a unit. This growth would apparently have been considerably larger except for the condition of Pennsylvania bituminous coal mining and an apparent sluggishness of general industry when compared with its greater activity in the states immediately to the west.

The *Industrial Middle West* states of Ohio, Illinois and Michigan show large gains over the previous year. Michigan, in particular, reveals an increase in output of 15.2 per cent and reflects the comparatively greater activity in the automobile business. Even with the inclusion of Indiana, which fell somewhat below the average, the increase in this area was 11.4 in percentage and almost 2 billion in kilowatt-hours. It is interesting to observe that, in actual kilowatt-hours, the increase in the use of electricity in these four states was greater than that of all New England, the South and the South West combined. The fact emphasizes once more the obvious (but often overlooked) fact that the markets afforded by miscellaneous heavy manufacture constitute the prime factors in the growth of electric service.

The *Industrial South* (which here has been taken to include the Carolinas, Georgia, Alabama and Tennessee) shows an increase a trifle below the national average, which fact apparently reflects the efforts made towards the balancing of production and sales by the textile industry in a year which was somewhat difficult for this line of business activity, and which moderate rate of increase stands in strong contrast with the 25½ per cent growth reported by the Geological Survey or 1927 over 1926.

The *Southwest* (which here includes Mississippi, Arkansas, Louisiana, Oklahoma and Texas) shows an extraordinary and striking increase of 21.3 per cent when taken as a whole. It reflects, in large part, the great expansion of the oil industry and of the growth in agriculture and general manufacturing (with the consequent extension of electric service on a large scale) in Oklahoma and Texas.

The *North Middle West* (which in this analysis includes Wisconsin, Minnesota, the Dakotas, Iowa, Missouri, Nebraska and Kansas) shows only the moderate rate of 6.7 per cent increase over the previous year and appears to indicate a hesitancy in the expansion of trade, in particular in Iowa and Missouri.

The *Pacific Northwest* (which here includes Montana, Idaho, Utah, Oregon and Washington) shows a marked increase in the use of electric power, which is primarily a reflection of increased metallurgical activity combined with a considerable expansion of electric service and consistent progress in its diffusion to agriculture. Montana shows a growth of 16.1 per cent, which again emphasizes the pick-up in copper mining and railroad traffic during 1928.

Of the remaining states, Colorado shows an actual decrease under the previous year, due apparently to some hesitation in the specialized mining industry of this region, while Arizona indicates a large gain, which reflects conditions in copper mining, a very considerable extension of irrigation service, and an increase in general trade.

Percentage of Increase in Electrical Output Five Times Increase in Coal

THE steady improvement made by the public utilities of the country in the efficiency of generating electricity by steam is shown by the summary of the use of fuel recently released by the United States Geological Survey. In calling attention to the progressive reduction in the amount of coal necessary to produce a kilowatt-hour in the average power plant, the survey states:

> "Public-utility companies and their power-plant operators were again successful in increasing the efficiency in the utilization of fuels in the generation of electricity. The amount of electricity generated by the use of fuels in 1928 was 5.5 per cent more than in 1927. The amount of fuel consumed, however, was only 1.1 per cent more than in 1927. The increase in output was therefore five times as much as the increase in the amount of fuel consumed. The average rate of fuel consumption for the entire United States in 1927 was 1.84 pounds of coal per kilowatt-hour; in 1928 the rate was reduced to 1.76 pounds. In 1919 the average rate of coal consumption in generating electricity was 3.2 pounds per kilowatt-hour. The rate of 1.76 pounds for 1928 is therefore very close to half the 1919 rate.
>
> "If coal had been consumed by electric public utilities at the rate of 3.2 pounds per kilowatt-hour in 1928 the increase in fuel consumption would have been about 38,000,000 tons, representing about $150,000,000."

If the saving of 38,000,000 tons of coal during 1928 (which was the result of the use of 1.76 pounds per kilowatt-hour as against 3.2 pounds in 1919), had been accomplished through the replacement of coal by more water power, an additional total of 43,200,000,000 kilowatt-hours of hydro-electric energy would have been required over and above the 34,747,000,000 actually generated.

In other words, if fuel use had remained last year at the same efficiency as prevailed in 1919 and this saving in coal had been effected by installation of water power instead of steam, it would have been necessary to increase the capacity of the hydro-electric plants of the country by about 14,000,000 horsepower—to more than twice the present amount.

Even the comparatively small saving of 0.08 of a pound of coal (or about 1¼ ounces) per kilowatt-hour (as a result of the use of 1.76 pounds in 1928 as against 1.84 pounds in 1927) is equivalent to 2,120,000 tons during the year.

Electrical Apparatus Committee Meeting

By E. E. George

THE Electrical Apparatus Committee met at Cleveland, Ohio, on January 9 and 10, with J. Allen Johnson, Chairman, presiding. Three general sessions were held with one-half day additional devoted to Subcommittee meetings. The average attendance was about 80. The following is a résumé of the topics discussed:

Circuit Breakers

Among the many subjects dealt with by the Substations Subcommittee (L. G. Smith, Chairman), oil circuit breakers received their share of attention from many angles. One manufacturer has made concessions with regard to the use of transformer oil in circuit breakers and further developments along this line are expected.

Two of the large manufacturers promised developments of an unusual nature at an early date in connection with faster operation of circuit breakers. The production of high speed, high duty circuit breakers at reasonable cost has been agitated by the Apparatus Committee for several years, and the manufacturers are apparently making every effort to develop suitable equipment of this character. A brief description of the development of the Deion air circuit breaker was presented by representatives of the Westinghouse Company, and a part of the Committee witnessed demonstrations of this circuit breaker at East Pittsburgh on January 12, following the meeting.

The procedure being followed with regard to special tests on circuit breakers by the operating companies was outlined. As the information obtained by these tests is confidential between the participating companies, it was thought inadvisable for the Apparatus Committee to sponsor this work and it is being handled by a special committee of the Engineering National Section.

There was considerable discussion with regard to the coordination of N.E.L.A. and A.E.I.C. activities with regard to standardization of oil circuit breakers. Various other organizations are recognized as having an interest, and the desirability of joint action was discussed. The main Committee passed a resolution authorizing the Chairman to take such official action as is necessary to coordinate these groups to the end that cooperative action may be established.

Power Transformers

The new proposed standards of the A.I.E.E. for operating power transformers on a temperature basis were approved by resolution of the main Committee, "as a suitable basis for obtaining operating experience." Present standards are for rating purposes only, and there has been for some time a demand from operating companies for operating standards. The general principle of operating by maximum observable temperature, rather than by temperature rise, was strongly endorsed by several speakers, temperature rise being recognized as a proper criterion for design and rating, but actual temperature should be the basis of operation. The new proposed standards will encourage more extended operation by temperature and provide a statistical basis upon which more perfect operating standards may be set up at some future date.

One company reported that it is buying practically all power transformers of a standard size, and with three windings. A description of its procedure in testing power transformers which have been in service for some time was also furnished by one company.

Constant Current Transformers

The proposed A.I.E.E. standards for constant current transformers were discussed. Several companies reported disastrous failures of constant current transformers on open circuit, or when lightly loaded. This was found to have been caused by very high core losses at light load which occasioned sludging of the oil due to high temperature. Many pole type constant current transformers were found to be sludged so badly that the coils could not move freely. Some companies are taking care of this by buying such transformers with taps, but if each transformer supplies two circuits, as is frequent practice, the loss of one circuit may cause trouble. It was suggested that companies test out their constant current transformers for core losses due to magnetic leakage, over a wide range of load.

One company pointed out that pole type constant current transformers must be erected perfectly level. The general design of constant current transformers was criticized on account of the noise, insufficient insulation of leads, lack of protection, etc. It was pointed out that present designs left much to be desired from a safety standpoint, on account of inadequate enclosure.

System Stability

Under the auspices of the Generating Stations Subcommittee (C. A. Harrington, Chairman) one session was devoted to a discussion of the relation of the generating station to system stability. This discussion was quite comprehensive, embracing all factors of the generating station which can influence system stability, including prime mover characteristics, governors, generator characteristics, transformer characteristics, excitation systems, circuit breakers, auxiliary devices, and operation.

One company pointed out the desirability of having governor pilot valves on water wheel driven machines marked with an indication of rated speed, no load position, in order that when such machines are floating as reserve generating capacity the governors can be so adjusted that the machines can start delivering power with a minimum loss of time in case of system disturbance, at the same time avoiding the necessity of supplying the unit losses from the turbine at extremely low efficiency.

One manufacturer stated that low reactions and high short circuit ratios on generators were very beneficial in improving stability, also that damper windings on water wheel machines are quite useful on line to ground faults. The double windings being used in very large turbo generators can be so connected to the system as to increase the stability very greatly without increasing short circuit current.

All companies agreed that very fast relaying of circuit breakers is highly desirable in improving stability, and that on some systems the present limits were in the relays. In companies which set most relays at 20 cycles or 1/3 of a second, there is not much possibility of further improvement until the operating time of oil circuit breakers is speeded up. One company reported that speeding up the clearing of faults from 1 second to 5/10 of a second increased by 65 per cent the load carrying capacity of their 110 kv. tie lines.

One point on which there was complete agreement was that there was need for a circuit breaker which would clear faults in less than 1/10 of a second, and of ground, differential, balanced, impedance, or other relay schemes which would be independent of normal load and which could, therefore, be set very fast. The new carrier current pilot scheme was mentioned as having possibilities in clearing faults rapidly.

The discussion on this subject was illuminating, and the Generating Stations Subcommittee is contemplating the issuance of a serial report on the general subject of "The Function of the Generating Station in System Control," which is intended to include discussion of both the stability and the voltage, load and reactive power control aspects of the problem.

General Generating and Substation Items

There was some discussion in regard to a standard procedure for testing lightning arresters, but no agreement was reached as the Committee seemed disposed to wait until the various field investigations of lightning now under way had revealed more information regarding the nature of lightning surges.

There was considerable discussion with regard to grounding of systems through resistors and reactors. Some of the companies' representatives in localities where load densities are moderate very definitely favored solid grounding.

Very satisfactory operation of arc rectifiers on 600-volt railway service was reported.

One company reported that they were extending the use of lead covered control cable on account of trouble in braid covered cable after a few years' service. The usual discussion of apparatus failures revealed trouble with oil circuit breakers continuing to predominate.

Installation Rules

Under the Utilization Subcommittee (L. B. Bonnett, Chairman), a Sub-group has studied the installation rules of a large number of operating companies and has drafted a model set of rules which covers in general the subjects regarded as important. These suggested model rules would be useful to companies considering revision or modification of their rules. The model rules do not go into great detail, but combine the best features of the rules of a large number of companies. It is hoped to have these rules in form for regular distribution at the March meeting.

Service Voltage Standardization

This subject is being agitated by the manufacturers partly on account of the general trend toward higher lamp voltages on all systems, and partly on account of the rapid development of three-phase, four-wire low voltage networks. Reports on both 115/119-volt and 120/208-volt networks were presented, which indicated little trouble except in isolated cases such as x-ray machines, elevator motors, etc. Such cases are easily corrected by auto-transformers at comparatively small cost. The voltage variation on networks in thirteen companies ranges from 1 to 3 volts each way. It was pointed out that the satisfactory operation of 115-volt lamps and appliances, and 220-volt motors on 120/208-volt networks was due to the good voltage regulation.

There was considerable discussion regarding the proper voltage for lamps. Curves were shown indicating that 10 per cent overvoltage resulted in 25 per cent of normal life and 5 per cent overvoltage in 50 per cent life. Reports were also received which showed that slightly under normal voltage resulted in extensive complaint about unsatisfactory performance of lamps and other household appliances, but that overvoltage resulted in few complaints and occasional compliments about speedy operation of vacuum cleaners, cooking appliances, etc. At present practically all lamps are sold in the 110 to 120-volt classes with a majority at 115 volts. By a negative, no response vote at the call of the Chairman, it was established that no representative present at the meeting had need for a 110-volt utilization standard on his system. One member reported 110 volts still in service, but slated for early elimination. There was some sentiment to the effect that 220 volts was a more economical voltage for lamps than 110 volts now that satisfactory high voltage lamps are being produced. This is particularly true where the appliance load is heavy. However, the general census of opinion seemed to favor the retention of the lower voltage for lamps, at least for the present. One of the manufacturers pointed out the great benefit which would result from the elimination of one of the present three recognized lamp and appliance voltages, since in that case the voltage spread necessary to provide for appliances would be very greatly reduced.

The Utilization Subcommittee is studying this problem and is expected to report progress at the Memphis meeting in March.

Motor Starting Currents

A Sub-group of the Utilization Subcommittee studying this problem, presented a resolution embodying a fundamental principle which it believed should govern the rules for starting currents. This resolution stated in substance that the permissible starting current should bear some relation to the magnitude of the installation in connection with which the motor was to be used. For instance, a customer having a large power service supplying 100 small motors should be allowed to start any motor across the line, but a small motor in a residential neighborhood might have to be started by resistance or increment starters in order to avoid causing flickering of lights. This resolution was adopted by the Committee.

Codes

The need was discussed for a complete overhauling of the National Electrical Code, to result in a much simplified code.

The opinion was expressed that power houses should not come under the provision of the National Electric Code, since they are not at all in the same class with residential and industrial installations which must be supervised in the interest of public safety.

General

At the request of the American Section of the International Electro-technical Commission, the Committee, by resolution, subscribed to the recommendation of the U. S. National Committee of the I.E.C., that no change be made in the present standard ambient temperature of 40 deg. C. for rating electrical equipment.

A report on "Uniform Records of Electrical Operation of Power Systems," prepared by the Electrical Apparatus Committee of the Southeastern Division and revised by a group under the Operating Practices Subcommittee, with the assistance of representatives of the A.I.E.E. Relay Subcommittee, was approved for publication as a serial report.

The desirability of studying the possibilities of railroad electrification within the service area of power systems was discussed.

A general feeling was expressed that companies requiring special equipment should be required to pay the extra cost of same, and that a large majority using standard equipment should benefit by reduced prices resulting from quantity production of standard items.

The Committee acknowledges with gratitude the hospitality and attentions of the Cleveland Electric Illuminating Company during the sessions of the Committee.

Reliable Time Delay Under Voltage Devices Now Available

FOR some years, certain industrial users of electricity as well as many central station engineers in contact with industrial applications, have recognized the opportunity for increasing service reliability in the great majority of industrial applications, through the use of a time delay device in connection with the conventional low voltage release which ordinarily forms a part of motor control equipments.

It is a well known fact that a momentary voltage dip on a power distribution circuit frequently results in shutting down all the motors on the circuit when they are equipped with control providing instantaneous under voltage protection. This necessitates restarting the motors after each voltage dip with resulting loss of time and in many cases, where continuity of operation is necessary, of material.

About two years ago at the instance of the Electrical Apparatus Committee, the principal makers of motor control equipment undertook the development of time delay devices for their equipments. These devices have passed through the experimental stage and for a year or more have been in regular production. One manufacturer reports that twenty-two hundred volt compensators are now regularly supplied with the time delay feature as standard equipment; this is also true of his automatic compensators. One manufacturer also reports that after January 1, 1929, compensators for motor currents of 150 amperes and larger will be standardized with the time delay feature. Another manufacturer lists the time delay device as an optional addition for all of the above equipment. Compensators for smaller motors and lower voltage motors, and magnetic control for full voltage starting can be equipped with time delay devices at an additional cost of from 5 per cent to 25 per cent, depending on the size and kind of equipment. Considering the motor and its associated starting equipment as a unit, the cost of the time delay feature is not usually a controlling factor. Taking for example a 25 hp., 440 volt motor, the time delay feature with magnetic control adds about 4 per cent and with hand compensator control about 7 per cent. The time delay under voltage release and the instantaneous release are interchangeable, so that compensators already installed can have the time delay feature added at reasonable cost.

Up to the present, the demand for the time delay under voltage release has been much smaller than was anticipated. Recent Committee discussion would indicate a lack of information among central station engineers and commercial representatives as to the present status of this device, and the opportunities for improved service through its intelligent exploitation. The Electrical Apparatus Committee having sponsored to some degree the development of this device, takes this means of bringing it to the further attention of the industry.

It is hoped that the manufacturers will find means of educating industrial users as to the merits of this device and contribute as far as they may to its more general adoption.

Prime Movers Committee Meeting

By Edwin B. Ricketts, *Chairman*

A TWO-DAY meeting of Prime Movers Committee was held in Pittsburgh on Feb. 4 and 5, with a total attendance of sixty.

Final reports were submitted by the following Subcommittees:

- Chemists
- Foreign Developments
- Condensers
- Power Station Betterment

Preliminary reports were submitted by the following Subcommittees:

- Boilers, Superheaters and Economizers
- Higher Steam Pressures and Temperatures
- Pulverized Fuel
- Stoker Equipment and Furnaces
- Turbines

The Chemists' report is a continuation of the work of publishing standardized test procedure for power plant chemists, particularly regarding the testing of turbine oil and feed water. It is hoped that such a standardization will increase the usefulness of comparative data from various stations.

There was considerable discussion on the question of hydrogen ion concentration and methods of preventing trouble by control of relative content of sulphate and carbonate in boiler water.

Foreign Developments

The Foreign Developments report sets forth a large amount of data on the development of central station practice in Europe, with statements from a number of designing and operating engineers from Sweden to Italy. It seems that there are a number of stations in Europe using steam temperatures approximately 100 deg. higher than in the United States. The use of pulverized fuel has increased in some sections where variations in kind of coal used are common, while on the other hand two new central stations in Italy and two in Germany have chosen the large under feed stoker as the means of burning bituminous coal.

The report contains a statement by Parsons Company on a new 25,000 kw., 3000 r.p.m. turbo generator in which the generator voltage is 33,000.

In discussing the Foreign Development report Mr. McFarland told of recent experiments at the Philo plant in Ohio on melting the ash from the stokers and obtaining ferro silicon which apparently was of satisfactory commercial purity with noticeable absence of phosphorous and sulphur. This subject is to be investigated further in the hope that this will prove a means of obtaining an income from the ashes and, incidentally, a load increase to supply energy to the necessary electric furnace which can, of course, be operated on the off-peak period or operated on secondary power subject to interruption in case the capacity is required for prime power sold elsewhehre.

Condensers

The Condenser Subcommittee report will give considerable data comparing the effects of water temperature, water velocity and cleaning upon the rate of heat transfer and the effect of air leakage on the depression of the condensate temperature.

Power Station Betterment

The Power Station Betterment report contains a description of changes made in four different plants which have resulted in increased capacity and economy. Last year this committee reported upon four methods of collecting data on operation and of using this data for the control of operating efficiency. This year the report covers changes in physical plant which require capital expenditure with resulting increase in either economy or capacity.

There was considerable discussion on the money value of automatic boiler control, with divided opinion and insufficient evidence to warrant definite conclusions.

Boilers, Superheaters and Economizers

The Boiler, Superheater and Economizer Subcommittee has arranged to obtain a large amount of operating data on a wide range of recent boiler installations. The 34,000 sq. ft. boilers in Long Beach No. 3 plant in California will be covered by operating records and also statements from several companies operating boilers at 1200 to 1400 lb. pressure.

The report will contain information on comparative exit flue gas temperature and superheat, on boilers changing from oil to gas fuel or vice versa.

New boilers to be installed at the Delray Station in Detroit and in the new 1400 lb. plants of Deepwater and Holland, will be covered by statements from the operating companies.

Higher Steam Pressures and Temperatures

The Subcommittee on Higher Steam Pressures and Temperatures will thoroughly cover the several new plants that are now or shortly will be using boilers with pressure above 1000 lb. Comparative capital costs of these higher pressure plants with 400 lb. plants will be shown by reports from the various companies which have decided upon the desirability of this higher pressure.

Mr. McFarland told the committee of the recent proposal of the General Electric Company to build what they call a "steeple compound type" turbo generator, wherein the high pressure turbine and generator are mounted above the generator of the low pressure unit, thus making a considerable saving in floor space and providing for short steam connections from the exhaust of the high pressure turbine to the inlet of the 400 lb. turbine.

Pulverized Fuel

The Pulverized Fuel Subcommittee proposes to publish in their final report, to be submitted in March, information on the power consumption and labor and maintenance costs of a wide range of pulverizing units handling different varieties of bituminous coal and of anthracite.

Turbines

The Turbine Subcommittee is obtaining the operating history of the newer machines, with particular reference to operating troubles. Discussion developed the fact that considerable trouble was still being experienced with broken blades and that the entire question of suitable blade material and design was indefinite. There also has been an extraordinary amount of trouble with throttle valves, which subject was discussed at some length in the round table discussion.

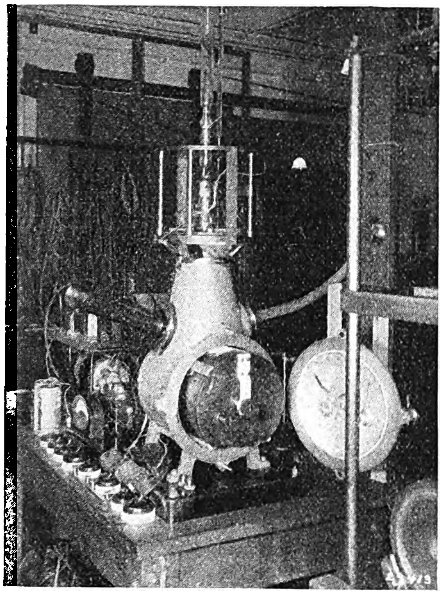
Professor White called attention to the fact that stainless steels with high chromium content should have a Brinell hardness of 225 to 250 and that several tests of blades which had given trouble showed this hardness to be down to 180 to 200. He suggested that possibly this might mean that the high superheat had gradually annealed the material, although it was pointed out that most of the trouble with blades had been in the low pressure stages where temperatures were not excessive.

The next meeting of the Prime Movers Committee will be in conjunction with the other Engineering National Section Committees in Memphis, Tenn., on March 13 and 14.

Progress of Joint Study of Telephone Protection —N. E. L. A. and Bell Telephone Systems

THE relation which telephone protection bears to the problems associated with inductive and safety coordination is under active study by the Development and Research Subcommittee of the Joint General Committee of the N. E. L. A. and the Bell System.

The scope of the project as laid out is wide and includes (1) a study of existing protective apparatus and methods, (2) the determination of the present and future requirements of telephone protection from the standpoint of lightning, induction, and contact, (3) possible modifications of existing apparatus and methods, and (4) the possible development of new types of apparatus or systems of protection.



Dufour Cathode Ray Oscillograph
Used by the Project Committee in Its Investigations of Protectors and Insulations
(This, the second Dufour Oscillograph in this country, is installed in the Bell Telephone Laboratories where all necessary auxiliary equipment is available for the various investigations.)

Tests of the operating characteristics and limitations of various types of telephone fuses have been carried out in high power laboratories. The operating characteristics of various discharge gaps have been determined with the aid of a Dufour cathode ray oscillograph which was obtained from abroad and was one of the earliest used in this country. This instrument is now being used in a study of the breakdown characteristics of various types of insulation used in the telephone plant.

An extensive study was made to determine the various types and combinations of telephone plant which require protection, together with the respective amounts and the expected frequency of occurrence of those types and combinations.

A survey of the types and kinds of power systems now in use was made to obtain, in so far as the protection problem might be affected, a representative cross-section of distribution and transmission practice. Opinion as to the characteristics of future transmission and distribution plant was also sought.

The more important investigations in which the committee is now actively engaged are as follows:

1. A determination of the dielectric characteristics of the telephone plant.
2. A study of the various klydonograph investigations to determine the value of voltage due to lightning to be expected on telephone plant and the propagation of such voltage.
3. A determination of ground potentials in the vicinity of power stations during times of fault on the power systems.
4. A study of fault conditions on power systems and their reaction on the telephone protection problem.
5. A collection and study of data on the field performance of telephone protection when lines are subjected to foreign voltage due to induction from or to contact with power circuits or to lightning.

What may be expected from the work of this committee is substantially as follows:

1. A mutual understanding of the features of the telephone and power systems which affect the protection of the telephone system.
2. Data on the operation and performance of present protective devices.
3. Information as to the importance of telephone protection in respect to inductive and safety coordination.
4. Conclusions as to the possibilities of developing improved protective methods and devices.

The personnel of the Project Committee now carrying on this work is as follows:

Bell System	*N. E. L. A.*
H. S. Warren, Chairman	R. N. Conwell, Chairman
R. K. Honaman	J. O'R. Coleman
O. B. Jacobs	R. D. Evans
D. H. Keyes	J. C. Martin
D. T. May	K. B. McEachron
J. H. Moore	William Shuler
A. H. Schirmer	S. A. Smith, Jr.

Annual Group Meetings of Engineering Section, New England Division, N. E. L. A.

By F. G. HARRIMAN

Vice-Chairman, Engineering Section, New England Division, N.E.L.A.

UNDER the auspices of the Engineering Section of the New England Division a very successful meeting attended by over 250 representatives of the electric utility and allied interests in New England was held at the Hotel Statler in Boston on February 13 and 14. Chairman C. A. Mayo of the Malden Electric Company presided.

The program included a luncheon and afternoon session followed by a banquet and evening session on February 13; and concluded with a morning session on February 14. A variety of subjects were ably presented by well-known and competent speakers, and the quality of the discussion which ensued after each paper indicated keen interest on the part of the delegates. The list of speakers and their subjects were as follows:

Address of Welcome by I. W. Day, President of the New England Division, N.E.L.A.
The Planning of a Utility System, by L. W. W. Morrow, Editor of *Electrical World.*
Operation of High Pressure Steam Electric Generating Stations, by R. Brown, Technical Assistant, Generating Department, The Edison Electric Illuminating Co. of Boston.
Pennsylvania Railroad Electrification, New York to Wilmington, Del., by E. R. Hill, of Gibbs & Hill, New York.
The Public Utility Situation in Maine, by J. E. Goodwin, Chief Engineer of the Maine Public Utilities Commission.
Fractional Horsepower Motors, by L. L. Elden, Technical Advisor to the General Superintendent, The Edison Electric Illuminating Co. of Boston.
Frequency Measurement and Control, by R. Brandt, Engineering Assistant, New England Power Association.
Moving Pictures showing the development of the electric locomotive and mercury arc rectifier.

High Pressure Steam Stations

The paper on high pressure steam stations by Mr. R. Brown dealt in a comprehensive way with the operating problems encountered in connection with the first 1200 pound boiler and turbine which was put in operation in the Edgar Station of the Edison Electric Illuminating Co. of Boston in December, 1925, and the later installations using 1400 pound pressures. It was pointed out that the troubles with this equipment were not greatly different or more serious than those experienced in normal pressure stations, and the availability factor in actual practice was remarkably good. As the cost per kw. of a properly designed high pressure station was stated to be no higher than for a normal pressure station, they feel that the increased efficiency from 1.02 pounds of coal per kw-h. output at normal pressure to 0.97 pounds at 40 per cent and the estimated 0.90 pounds at 100 per cent high pressure development is a clear saving.

Railroad Electrification

Mr. E. R. Hill's paper on railroad electrification traced the development of this important subject from the first electrified line in this country, which was the Nantasket Beach, Mass., branch of the New York, New Haven & Hartford Railroad in 1895, to the present day when about 3900 miles of track are electrified, with prospects of 5500 miles by 1935. The present project of the Pennsylvania Railroad involves the electrification of 1300 miles of track at a cost of 100 million dollars, and is the largest project to date in the world. The magnitude and importance of this project is indicated by the estimate that the ultimate development will have a demand of 250,000 kw. and will use 1,400,000,000 kw-h. per year at a load factor of 68 per cent. The plans contemplate purchasing the entire electrical requirements from public utility stations, which indicates the tremendous importance of this business to the industry. Lantern slides were shown illustrating different types of construction and equipment, and an active discussion of the advantages and limitations of railroad electrification followed.

Power Systems Committee

Mr. L. W. W. Morrow, well known as editor of the *Electrical World*, and recently appointed as the first chairman of the National Power Systems Engineering Committee, explained the purposes of this new committee and stressed the new position and obligations of the engineer with relation to the other branches of the industry. He appealed to engineers to be broadminded; "to bring our new knowledge of engineering science to the benefit and uplifting of mankind"; and in planning our systems to keep in mind all the factors of cost, expected growth, revenue and net balance.

Power in Maine

Mr. J. E. Goodwin's paper included much interesting data on the activities of the public utilities in Maine; such as the statement that 99 per cent of the energy generated in the state in 1927 was generated by hydro. It was pointed out that Maine's problems are different from the balance of New England due to the low density of its population, the figure for Connecticut, for example, being 316 persons per square mile, and for Maine only 24. Yet 78 per cent of the population and about 24 per cent of the farms are supplied with electric service.

Frequency Control and Measurement

The subject of frequency control and measurement was very thoroughly covered by Mr. Robert Brandt, who stressed the increasing importance of this subject due to the rapid expansion of interconnected systems. Such phases of the subject as the types of instruments available, the characteristics and limitations of governors, automatic versus manual frequency control and the requirements of an ideal automatic frequency controller were carefully presented. The magnitude of the problem even in New England is illustrated by the fact that nearly all of the large systems in this district are now interconnected, with a combined demand of nearly a million kw. The subject was discussed at length by a number of prominent engineers representing the leading manufacturers and utility companies.

Fractional Horsepower Motors

Mr. L. L. Elden, whose work in representing the interests of the utilities with the object of improving the characteristics of fractional horsepower motors has been nationally known for many years, outlined the growth in importance of this subject whose present proportions may be seen from the statement that four million such motors will be produced in 1929. A very important and encouraging announcement was made that at a conference held only last month between the appliance and motor manufacturers and utility interests, an agreement was reached with several large manufacturers that only motors meeting the new approved specifications will be used in the future. The desirability of the new type motor from the point of view of the electric company is at once evident from the fact that many split phase ¼ horsepower motors now in use have a starting current of 35 to 45 amperes, representing a momentary load up to 5 kilowatts, while the new specifications limit the starting current to 15 amperes, and some have actual starting currents of less than ten amperes. The discussion of this paper by several large motor manufacturers indicated that full cooperation may be expected from them in putting over this program.

Interest was maintained at a high pitch throughout the meetings, which were generally conceded to be the most successful of any held by the section in recent years.

North Central Engineering Meeting

At the third annual engineering conferences of the North Central Electric Association, held at Minneapolis, Minn., Jan. 21-22, E. C. Stone, Chairman of the Engineering National Section, stressed the expanding functions of engineers in electric utility progress and offered to them five definite recommendations. These were: they should seek to work out in practice the motto, "More system capacity per dollar of investment"; they should avail themselves of the valuable experience contained in serial reports; they should interest themselves in the regulatory code proposals now before the industry; they should analyze the performance characteristics of the systems they operate to the end that operating costs may be lowered; they should make critical analyses also of system design and construction in order that the wide variations in costs now existing may be narrowed.

Meet Dissatisfied Customers Half Way

Conscientious and persistent efforts to meet dissatisfied customers at least half way will prevent the greater part of the complaints made to State regulatory commissions E. H. Morris, chief engineer of the North Dakota Railroad Commission, told the convention. To back up his statement, Mr. Morris said that of the complaints received by the North Dakota commission, less than 5 per cent had any basis at all and only 2 per cent were justified.

Conspicuous success with the idea that is not new but has seemed more alluring than practical to many central-station merchandisers were recounted by C. J. Strike of the Northwest Public Service Company, Huron, S. D., in an address on "How Operating and Commercial Departments Can Coordinate Their Activities." Mr. Strike told interestingly how he persuaded operating men to consider themselves salesmen as well as meter readers, linemen and service men, and described how they achieved really surprising results.

That the average distance traveled by a kilowatt-hour from generator to consumer was between ten and twenty miles was one point made by H. S. Bennion of the N. E. L. A. headquarters staff in his address on "Interstate Power." The small amount of energy that crosses State lines emphasizes the essentially local characteristics of the power industry, he said, and leaves small argument for the suppression of State by Federal regulation or for superimposing the latter on the existing situation.

Stock Taking for the Engineer

Speaking at the conference banquet, L. W. W. Morrow, editor of the *Electrical World*, said that the time had now come for the engineer to take stock of what he was doing, to forsake the path of expedience that heretofore was the only road open to him and to consider the building of electrical systems with strict regard not only to the technical but to all the essential factors. Mr. Morrow gave an illuminating sketch of the work of the new Power System Engineering Committee, of which he is chairman. This committee will attempt to set up in logical and comprehensive fashion the factors that determine system design, so that central stations may develop their systems according to orderly and coherent programs fixed by operating conditions.

Group Discussions

A day of well-attended and interested group discussions kept the 219 engineers present at the conference occupied right up to the close. One subject that appeared to have invaded the deliberations of all of the committees, even the one on hydraulic power, was radio interference. This problem, judging from the animated discussion it provoked, is still far from a solution, particularly in regions distant from high-powered broadcasting stations where receivers must be operated at high sensitivity.

So many subjects of discussion were developed that it was decided to devote in future considerably more time to a "clearing house" of ideas, with more adequate provision for impromptu speakers, Secretary J. W. Lapham said. He told the opening session that the light and power companies of the Northwest spent nearly $12,000,000 for construction and replacements in 1928.

Merchandising Bureau Meets at Detroit

THE four committees of the Merchandising Bureau of the Commercial National Section were in session at the Book-Cadillac Hotel, Detroit, on Feb. 5 and 6. Chairman F. D. Pembleton's schedule included committee meetings on the first day and executive meeting on the day following.

The minutes of the meetings of the committees show that practically every phase of power company merchandising practices and policies is receiving considerable attention.

The Range Committee, F. A. Coupal, Chairman, is developing a report bringing out the newer facts on desirability of range business, and the proposed chapters were discussed in detail. The Range Committee of the Northwest produced authoritative data in connection with the operating aspects of the range load, and this year's report will stress the selling aspects. Informative data which the report will contain will be of immeasurable value to commercial men interested in the promotion of domestic cooking.

The progress of the Water Heating report has been outlined in previous issues of the BULLETIN. Nation-wide interest has developed in the subject, and the committee under Chairman N. T. Wilcox is sponsoring an analysis of the class of business which is of outstanding value. The field work is being done under the direction of the Engineering Department at headquarters. Well-defined tests will be in progress over a term of months. The final report cannot be published previous to the convention this year.

C. L. Dunn, Chairman of the Refrigeration Committee, reported as a nation-wide activity an educational movement on the value of food preservation. The completed plan has been sent to the Executive Committee of the Commercial Section for indorsement.

The important phases of merchandising have been investigated and progress report made by Chairman C. L. Harold. This committee will produce a supplemental report on oil burners, emphasizing the marketing aspects.

The subject of substandard devices, so important at this time when inferior products are being sold to the public, has had most considerate attention and valuable test data has been obtained.

A subcommittee is making plans for the stimulation of sales of farm appliances. The opportunities in this field are fully realized, and the value of selling more electric equipment to rural customers for the common interest of the farmer and the utility.

An analysis of the radio situation in connection with the sale of radio sets by the power companies indicates that radio equipment has reached a state of sufficient commercial stability to justify active merchandising by the power companies.

Returns from the Residence K. W. H. Contest are being received daily at headquarters from 156 entrants in the contest. Striking gains in kilowatt-hour sales have been made by many of the power companies, which emphasizes the selling stimulation through this activity of the Merchandising Committee.

All committees of the Merchandising Bureau will hold their meetings during the Commercial Conference at Chicago on March 20-22.—C. E. G.

Industrial Heating Clinic

AN INDUSTRIAL Heating Clinic will be held at the Case Engineering School, Cleveland, on May 13th to 24th, under the auspices of the Industrial Heating Committee of the Commercial National Section.

In addition to the class room meetings, there will be inspection trips made to Cleveland and Detroit. The plans of the committee are such that every commercial executive that is serving communities with potential sales possibilities for industrial heat applications, will be justified in sending at least one salesman to the Clinic. The National Electric Manufacturers Association is cooperating with our own Association in conducting the Clinic.

Commercial National Section Conference, March 20-21-22

GROUP meetings of the Commercial National Section will be held at the Edgewater Beach Hotel, Chicago, March 20 and 21. The Executive Meeting of the Section will be held March 22.

On March 19 and 20 the Great Lakes Division will hold a Merchandising Conference at the Edgewater Beach Hotel. to which all commercial men are cordially invited to attend.

Schedule National Section Meeting

Committee	Wednesday, 20.	Thursday, 21.
LIGHTING BUREAU		
Commercial and Industrial Lighting	10:30 A. M.	
Electrical Advertising	10:30 A. M.	
Home Lighting		9:30 A. M.
Street Lighting	9:30 A. M.	
MERCHANDISING BUREAU		
Domestic Electric Range		9:30 A. M.
Merchandising Sales		9:30 A. M.
Refrigeration		9:30 A. M.
Water Heating	9:30 A. M.	
POWER BUREAU		
Commercial Cooking	9:30 A. M.	
Electric Truck		9:30 A. M.
General Power	9:30 A. M.	
Industrial Heating		9:30 A. M.
GENERAL		
Customer Relations	9:30 A. M.	
Promotional Rates		9:30 A. M.
Wiring Sales		9:30 A. M.

Pacific Coast Commercial Section Meeting

By Cristel Hastings

Pacific Coast Electrical Association

ONE of the most successful and well attended conclaves held thus far by the Commercial Section of the Pacific Coast Electrical Association was held in Los Angeles on January 17 and 18, under the Chairmanship of Mr. James F. Pollard.

Possibly the outstanding feature of the gathering was the talk presented by Mr. G. B. Buck, manager of the New Business Department of the Public Service Company of Colorado, on Sales Personnel and Merchandising. The address was made visually interesting by a series of charts and cartoons sovering various phases of the address. Predicting that as far as merchandising is concerned the battle ground of the future will be on the door-step of the home. Mr. Buck succeeded in driving home a salient point on Merchandising. This comprehensive talk was one of the best with which the Commercial Section attendants have been favored to date.

During the conclave a joint session was held with the Western Metal Trades Congress, and which was attended by approximately 200 members of the two groups. Splendid talks were made by Mr. N. R. Stansel of the Industrial Engineering Department of the General Electric Co., Schenectady, N. Y., and by Mr. T. C. Kelly, Industrial and Heating Apparatus Manager of the Westinghouse Elec. & Mfg. Co. Both of these addresses were ilustrated by lantern slides and showed the great variety of applications of electric heat in the metal industry such as welding, baking enamel, and the tempering of metal parts. Immediately following these addresses there was shown the Industrial Heating film prepared by the N. E. L. A. Industrial Heating Committee last year.

Still another address of importance was that presented by Mr. Harry Tuttle, Manager of the Parmalee Dohrmann Company, on the subject of Merchandising. Mr. Tuttle laid particular stress on the importance of catching the attention of the public in new and striking ways as well as upon the selection, training and inspiration of sales personnel.

The conclave closed with a report by the various Bureaus of the Section on progress to date in all activities. It was reported that the Agricultural Handbook prepared by the Agricultural Power Committee under the direction of Mr. E. G. Stahl, Chairman, was ready for the press and would be available for distribution shortly by the Pacific Coast Electrical Association. Another booklet that has been completed is that of the Employee Essay Contest descriptive of the second annual contest conducted by this Committee covering a comprehensive subject of general interest to the industry. The subject chosen for the current year's contest is "Why I Would Like to Live in a Red Seal Home."

The final conclave of the Commercial Section will be held in Fresno, Cal., during the latter part of March, at which time all of the Committees of the Commercial Section will present data and material covering the activities of the Section during the Administrative Year 1928-1929.

ACCOUNTING SECTION

J. F. Ford, *Chairman* Fred W. Herbert, *Director, Service Department*

Group Meeting Accounting National Section

THE second group meeting of the Accounting National Section for the administrative year was held at the Palmer House, Chicago, Ill., on Monday and Tuesday, February 25 and 26, under the chairmanship of Mr. John F. Ford, Chairman of the Section. Each succeeding meeting of the Accounting National Section, both in attendance and in constructive work, shows decided improvements and most satisfactory accomplishments by the standing committees of the Section. The attendance at this meeting exceeded any previous group meeting, over one hundred of the committee personnel being registered, including officers, chairmen of the eight standing committees and geographic division representatives.

The program provided for sessions of the several committees on the morning and afternoon of the first day and the morning of the second day, for the consideration and deliberation of subjects later to be formulated into serial reports outlining the accomplishments of each of the committees and studies which these committees have made on very vital subjects to the member companies through the coordinated viewpoint and survey made by these separate committees.

Get-Together Luncheon

Commencing with this administrative year, an innovation was introduced in the meetings of the Accounting National Section by which a get-together meeting of a general character was held at noon, the first day of the session, as a luncheon meeting. At these meetings, accountants, engineers, and commercial men from the operating companies in and around the meeting place of the section are invited to participate, with the thought that others outside of the Accounting Section might get a great deal of constructive information through these group meetings. About 225 members attended this luncheon meeting, at which stirring addresses were made by Mr. John F. Gilchrist, Vice-President of the Commonwealth Edison Company, and Mr. William J. Hagenah, Vice-President and Special Counsel of the Byllesby Engineering and Management Corporation. Mr. A. Jackson Marshall, Secretary of the Association, outlining a tentative program of the convention and exhibition to be held in Atlantic City, June 3 to 7. He emphasized that one afternoon would be devoted to a special session of the Accounting National Section and it is hoped that a large representation of the accountants of all public utilities and member companies will take advantage of this opportunity and be at this convention, as the speakers and subjects to be presented will be of great interest to the accountants as well as executives attending the convention.

Committee Work

At the meeting of the Executive Committee, chairmen of the several standing committees of the Section outlined to the Executive Committee the work which their committees are accomplishing during this administrative year. At this meeting reports were made also by representatives of like committees in the Geographic Divisions. It was gratifying to hear from these reports that wonderful progress has been made in the Geographic Divisions this year and the reports also showed how fully the Geographic Divisions are contributing to the work of the National Section. The Accounting National Section is dependent upon the coordinated work of the Geographic Division representatives and is getting the most hearty and satisfactory support from the several divisions.

Exhibition

An interesting report was made by the Exhibition Committee outlining the program for the exhibit at the convention of machine billing and machine application in the operation of public utility companies. It is felt that this exhibit will be one of the most instructive and interesting features of the work of the Accounting Section for the entertainment and instruction of delegates from accounting departments of member companies.

In this connection the section is under obligations and extends its thanks to Mr. B. F. McGuire of the Commonwealth Edison Company, Chicago, for putting on a most instructive exhibit at the rooms of the Commonwealth Edison Company of the mechanical devices used by that company in customers' records and billing and other operations of the company. This exhibit was well attended and was pronounced a most interesting display of the accomplishments and advancements in machine operations by public utilities. It is the intent of the Exhibition Committee to enlarge on this exhibit for the benefit of accountants during the national convention.

Subjects Being Considered

There are a great many important subjects which are being considered by the Accounting National Section committees, subjects which are creating a great deal of national interest, such as interchange of power accounting, merchandise accounting, the international discussion on change of calendar, financial problems which have been presented to the Corporate Finance Committee, and a number of allied subjects. The Accounting National Section feels that it is doing excellent work by giving these subjects immediate and careful consideration and by widely disseminating the information which these committees secure.

The Chairman was empowered at the meeting of the Executive Committee to appoint a Program Committee, which will meet shortly and outline a program for the session of the Accounting National Section at the convention. The Chairman was also empowered to appoint the Nominating Committee to report at the Executive Committee meeting just previous to the convention.

F. W. H.

RURAL ELECTRIFICATION

The Cost of Electric Service to Farmers

Report of Minnesota Rural Electric Service Conference

By **Charles F. Stuart**

Chairman, Rural Electric Service Committee, N. E. L. A.

WHENEVER a company rural electric man talks to farmers about building a line to serve an agricultural community in any part of the United States invariably the first thing the farmers want to know is what the service will cost them. Most of the farmers are pretty well sold in advance on "what a nice thing it would be" to have electricity on the farm. That part of it does not require much selling. They all say something like this:

> "Sure I would like to have electricity and so would the wife and the rest of the family, but I don't know that I can afford it. I have so many expenses now that I don't feel like taking on much more. You know how things are. Everybody in the family wants electricity but we can't have it unless the cost comes within the limits of the farm pocketbook."

There was held in Minneapolis, Minn., Jan. 28 and 29 last, a Rural Electric Service Conference, the second of a series of such meetings being held in the Geographic Divisions of the National Electric Light Association in cooperation with the National Rural Electric Service Committee. At this conference a number of speakers developed some extraordinary facts intimately related to this question being asked by thousands of farmers from the Atlantic to the Pacific and from Mexico to the Canadian border—the question of "how much will it cost?"

These speakers offered direct and indirect testimony of a most emphatic nature, that electric service properly employed on the farm costs exactly nothing at all, or, to go a step farther and to be more exact, that it is likely to prove a good financial investment, an actual money maker.

It is too early to predict that on any farm anywhere in the United States electricity can be made a good investment, that it can be used so that it will more than pay its own way, but certainly it is encouraging to hear from men who are in a position to know, who can speak authoritatively, who have been keeping actual records, that at least on a number of farms electricity has proved that it fully pays its own way.

The Red Wing Project

Professor E. A. Stewart, formerly Project Director for the University of Minnesota on the Red Wing experimental farm line, was the first speaker to offer definite information on this point. He had before him a most voluminous report, hundreds of pages of it, containing definite data pertaining to the first four years during which electricity was used on the Red Wing farms. This report shows, Professor Stewart said, that on the five farms for which continuous records are available, the gross income the fourth year was 42.9 per cent in excess of the first year, and that the operating expenses during the four years had increased but 1 per cent. Had it not been for a material boost in taxes, operating expenses would have shown a decided decrease. The net earnings for the five farms showed an increase of 81 per cent. In the operating expenses is included the bills paid the power company for electric service. These bills for 1927, which was the fourth year, showed an average of $14.76 per farm per month for an average consumption of 243 kw-hr. per farm per month. These figures, however, Professor Stewart explained, do not cover all the cost of electric service.

"There is another item," said Professor Stewart, "one which I think has been generally overlooked, and that item consists of the overhead charges on the investment the farmer makes in equipment. On these five Red Wing farms there was installed equipment which, if figured at regular retail prices, would have cost $16,667. Perhaps I should explain that this is not all strictly electrical equipment, but it all came as the result of electricity. I have included in this total such things as plumbing, bathrooms, a couple of furnaces, and not only the motors which operate the farm implements but the implements themselves. I have figured 12½ per cent to cover interest and depreciation on this investment. This is only a business-like procedure, and for the fourth year, 1927, this would have called for a charge of $2,083. It is interesting to note that this overhead on the farmer's investment in equipment amounts to about two and a half times his bill for electric current, so it will be seen that the bigger cost to the farmer in electric service, if he is well electrified, is not the cost of electricity, but the overhead on his investment in equipment.

"However, it is equally interesting to note that when we subtract this $2,083 from the net income for 1927, we still have an increase of 50.9 per cent in the net for 1927, as compared with the net for 1924."

Professor Stewart conceded that perhaps electricity is not entirely responsible for the much improved financial condition of these Red Wing farmers. He declared that the fact that many agricultural college men frequently visited these farms and perhaps offered helpful suggestions might have had something to do with it, and also the fact that the farmers were compelled to keep records made them better business men. But whether or not there were other influences, Professor Stewart certainly was armed with a powerful array of data showing definitely how on scores of farm operations electricity had cut labor costs or increased production, or both.

He offered much to sustain a contention that in the main, at least, the improved financial condition was due to liberal and intelligent use of electric energy, and emphasized that no one who studies the situation at Red Wing can get away from the fact that this improvement started when the farmers first began using electricity and has continued steadily ever since and that the end is not yet.

The Renner Project

Then came Professor R. A. Patty, South Dakota State College, who is Project Director on the Renner, South Dakota, experimental line. He had more to offer along the line of electricity paying its way on the farm. While on the Red Wing line, most of the equipment was loaned or donated to the farmers, on the Renner line the farmers have bought all their own equipment excepting two feed grinders which were used for a short period.

Professor Patty first gave the members of the conference information as to what equipment the farmer buys when he is investing his own money. There were seventeen customers on the original Renner line. As the first step, all of them wired their homes and farm buildings and, in most instances, did an adequate job of it when they were shown that it is poor economy to install flimsy and inadequate wiring systems. All seventeen installed lighting systems for the most part practical and adequate. Within the limits of three months sixteen of them bought washing machines, and shortly after the seventeenth made it 100 per cent. They all bought electric irons, and they all turned to electricity to pump their water, many of them abandoning windmills.

There were two milking machines when the line was built and now there are nine, all operated by electric motors. Most of the farmers have installed utility motors in the farm shops to run the lathe, drill, saw, and other farm shop machinery. Nine of them have electric refrigeration for household purposes. In addition, there are motors on the various farms grinding feed, cutting ensilage, husking and shredding corn, mixing cement, and performing other tasks. Quite a number of the farmers have installed electric ranges.

There are now nineteen farms on the line and during the five-year period the consumption of electricity has mounted steadily until it now exceeds 150 kw-hr. per month per farm.

Professor Patty was asked whether

electricity had paid its own way on the Renner line. His answer was immediate.

"I have not made an economic study such as Professor Stewart made at Red Wing," he replied, "but I feel, in fact, I absolutely know, that electricity has not cost these farmers a cent. In making this statement I have information of my own to go by and, in addition thereto, quite a number of the farmers have volunteered just such a statement to me. They know it themselves."

Here were two agricultural college men offering definite data that electricity at least on these Minnesota and South Dakota farms can be employed in such a manner that it is not an added expense to the farmer.

A Farmer Testifies

The next evidence was offered by a farmer himself who has kept figures, who knows whereof he speaks. His name is H. A. Schimmelpfenig, who has a poultry farm near Chaska, Minn. Before going into his story perhaps it is wise to explain that his farm was so situated that it was impossible for him to obtain service at anything like an average farm rate. It was necessary to build two miles of line to serve him and him alone, and, as a consequence, it was necessary to quote him a high monthly fixed charge, in fact, a figure that would stagger the average farmer. But it did not stagger him. He asked that the line be built.

His current consumption last year reached a total of nearly 15,000 kw-hr., and as a result of this heavy consumption his fixed monthly charge did not interfere materially with his earning a low unit rate. In fact, he stated that his energy, including the fixed charge, was costing him about 4c. per kw-hr.

It is interesting to note in connection with Mr. Schimmelpfenig that his farm home and buildings do not constitute a pretentious place. In fact, they are not suggestive at all of a likely farm electric customer, all of which goes to show that it is not always the big and pretentious farm home which proves an acceptable customer to the company.

Now getting down to Mr. Schimmelpfenig's story.

"To break even on poultry farming," he said, "one must get an average of 100 eggs per hen per year. At that rate the farmer neither makes nor loses money. He is just standing still. Without entering into a discussion of breeding, which is a big subject in itself, I should say that the average hen, left to her own resources, produces less than 100 eggs per year. To make a success of poultry farming we must aid mother nature. Electricity provided its first aid on my place when I lighted my henhouses and, as a consequence, my hens have been producing an average of 130 eggs per bird per year. It will be seen right away then that in this one application alone electricity put me on the profit side of the ledger.

"The next use was for incubation. No competent poultry farmer leaves incubation to the hen in this day and age. Biddy's way of doing things is antiquated. She sneaks off by herself and lays 13 to 15 eggs and proceeds to set on them. The commercial incubator makes her efforts look silly. I have two incubators of 16,000 egg capacity each. They were both oil incubators but I had them equipped with electric elements, leaving one, however, so that I could continue to operate it with oil in order that I might have a check on the relative cost and efficiency of both types of incubators. On the 4c. rate which I am earning on my place, I found the cost of oil and electricity about the same, but electricity gave me, due, probably, to accurate heat control, a 9 per cent greater hatch. Here again electricity is helping me make a success of my poultry farm.

"The third application was for brooding. Most poultry farmers sell day old chicks. I do also, but in addition thereto, I have gone into the business of selling two weeks' old chicks. I found that the highest percentage of mortality occurs during the first two weeks due, largely, to lack of knowledge and lack of equipment in taking care of baby birds. I charge 7c. extra per bird for keeping them over the first two weeks' period. I installed electrically heated brooders in a room 20 x 24 ft. They have a capacity of 8000 birds. Due to the use of electricity, I was able to install four decks of brooders in this room. With coal heat for brooding, I would have required a room several times as large. I have found the thermostatically controlled electric heating of brooders a splendid investment. The temperature never varies a whole degree from the desired heat. I start the baby birds off at a high temperature and then every few days reduce that temperature. My mortality rate during the first two weeks' period has been less than 1 per cent, and I am making an additional profit in taking care of these birds over the first 14-day period. It is electricity which contributes largely to that profit.

"I also use an electric hot plate, an electrically operated milking machine for my cows, an electric motor for water pumping, and electricity for various other purposes around the place. My bill runs over $100 a month, but for me it has proved an excellent investment, and I doubt very much whether my farm would be on the profit side of the ledger were it not for electricity."

This bill of more than $100 a month is not offered as an average which the farmers in the United States would have to pay for electric service. Rather it is cited as an instance where electricity has paid its way despite an exceptionally high bill, and nobody can argue Mr. Schimmelpfenig out of that.

Other Speakers

Indirectly, the writer offered the conference some further evidence along the line of electricity paying its own way on the farm. Recently, as Chairman of the Rural Electric Service Committee of the National Electric Light Association, I wrote to the chairmen of each Geographic Division Rural Service Committee, asking them to supply me three to five examples in each State in each division of actual farm customers who are using in excess of 3000 kw-hr. a year. I told the conference that I have received returns from more than forty States and that most of them sent all the way from two to ten times as many examples as requested and that they and many others with whom I have talked throughout the United States, are unanimous in the opinion that the liberal farm consumer is the satisfied farm customer. The consensus of opinion is that the farmer who uses only about 300 kw-hr. a year is usually more or less dissatisfied. When his consumption passes 1000 kw-hr. a year, he becomes a satisfied customer, and when it reaches 3000 kw-hr. he is enthusiastic. When it gets beyond there he becomes perfectly exuberant.

The significance of this statement is obvious. The farmer using 300 kw-hr. per year probably is paying what seems to him a high charge for a very limited service which he probably uses only for lighting, and rather inadequate lighting at that. While the farmer who is making liberal use of electric energy is not paying much more for it, but it is performing a much bigger service for him and, as the use increases, it is more and more likely that electricity is actually proving an excellent business investment for him.

Not only was much evidence offered at this conference that electricity could be made to pay its own way on at least many farms, but there were other speakers who offered much definite information as to how a company can organize a Rural Electric Service Department and how that department can aid and guide the farmer in intelligent use of the service.

Dr. E. A. White, Director of the National Committee on the Relation of Electricity to Agriculture, discussed the organization of company Rural Electric Service Departments and dwelt in particular on the organization of the Wisconsin Power & Light Co., with headquarters at Madison, Wis. The Rural Department of that company is described fully in a serial report of the National Rural Electric Service Committee published recently.* Dr. White also described other methods for company rural organizations.

C. P. Wagner, in charge of the Rural Department of the Northern States Power Co., gave some valuable suggestions as to how a rural department can put electricity to work on farms served by the company. He referred first to some five hundred customers of the Northern States Power Co. of Wisconsin. These customers were taken on a number of years ago before this company was owned by the Northern States Power Co. In some cases the lines built were hardly adequate to meet the present-day conception of farm business and, in addition thereto, most of the farms were inadequately wired. In 1926, the average consumption on these farms was 28 kw-hr. a month. When rural men got on the job in 1927, they boosted this average to 44 kw-hr., and, in 1928, to 66 kw-hr. This, Mr. Wagner said, was evidence of splendid work under adverse conditions. Several hundred customers taken on in the last three years by the Northern States Power Co. in Minnesota and the two Dakotas, each one of which has had the benefit of guidance from the Rural Department, already are averaging 150 kw-hr. a month.

---

*N.E.L.A. Pub. No. 289-12.

Mr. Wagner went into detail as to ways and means of advising the farmers in the use of electricity and at the same time stayed away from any suggestion of telling them how to farm.

More than 150 persons registered at the rural conference, the first of its kind held in this part of the nation, and the second of its kind in the United States. They represented power companies, agricultural colleges, agricultural press, country press, farmers, manufacturers of farm and barn machinery, and manufacturers of electric equipment. The idea back of the conference was for everyone who has been experimenting and investigating these last five years to get together for a free-for-all interchange of problems and ideas.

There were many other speakers who contributed to the success of the conference. F. S. Rice, Minnesota Power & Light Co., Duluth, Minn., went into the subject of rural distribution systems. B. E. Miller, Wisconsin Power & Light Co., Madison, Wis., spoke on rate structures. John Pike, General Electric Co., talked on farm wiring. Herman Schmechel led the discussion on Professor Stewart's Red Wing report. J. T. E. Dinwoodie, editor of the *Dakota Farmer*, Aberdeen, S. D., was particularly impressed at the array of evidence that electricity can pay its own way on the farm. He advised the rural men that the farmer does not care to hear about voltages, amperes, and kilowatts, but wants to know much about the dollar value of electricity on the farm.

Preston Hale spoke for the county agents and declared he found the meeting so interesting that he wished every county agent in the three States were present. James C. Morrison, past-president of the Minnesota Editorial Association, declared his appreciation of the economic side of electricity on the farm but that he, as an editor, and somewhat of a sentimentalist, was more interested in the humanitarian side.

David Gustafson, Thief River Falls, Minn., spoke for the implement dealers. Andrew Nelson of the Westinghouse Electric and Manufacturing Co., discussed selling equipment to the farmer.

John F. Reed, Chairman, Minnesota Committee on the Relation of Electricity to Agriculture, and Robert F. Pack, vice-president and general manager of the Northern States Power Co., were the speakers at the dinner meeting. Both expressed satisfaction with the progress being made in the North Central Division in applying electricity to agriculture, and both counselled that the work must continue to proceed in a safe, sane and sound manner. They emphasized that it is as much of a mistake to proceed too speedily as too slowly.

It should not be assumed from this article that farmers everywhere are going to be able to employ electricity so that it will come to them at no cost. The farms covered in the talks made by Professor Stewart, Professor Patty and Mr. Schimmelpfenig, are mostly dairy and poultry farms, where they grow most of their own feed. The reports made by these men are of infinite importance so far as farms of this character are concerned, and gives the whole rural situation a more optimistic aspect than anyone dared to hope for five years ago, but there is still much to be done. There are other types of farming as, for example, the big grain farms characteristic of the Central Western States. Here, often there is only one possible customer to a mile of line, and ways and means for the farmer to employ electricity profitably are not nearly so obvious on these farms.

There are the big cotton plantations of the South where again distances between farms often are considerable, and here it is more difficult to find ways profitably to employ electric energy, though it is interesting to note that at the recent rural conference at Dallas, Tex., one of the speakers delivered a paper on profitable irrigation of cotton fields by the employment of electricity for water pumping.

This is just a note of caution at the end of this article so that no false impression may be conveyed, but it nevertheless does not dim the optimism of the North Central Rural Conference.

GEOGRAPHIC DIVISIONS and STATE ASSOCIATIONS

News Letter from East Central Division

By D. L. Gaskill
Secretary-Treasurer

WHILE out in the Central West and in the States of West Virginia, Kentucky, and Ohio the weather has been unusually cold and stormy, yet the activities of the East Central Division have not suffered in any respect either in lack of interest or attendance at meetings.

Practically all of the standing committees have had meetings located at some point within the division, and some of these meetings partook of the nature of a large convention. The Accident Prevention Committee, under the chairmanship of W. A. Buchanan, Appalachian Electric Power Company, Huntington, W. Va., has staged a contest to maintain a lower ratio of accidents, and he reports that great interest is being shown. The Meter Committee, with M. F. Smalley, Ohio Power Company, Canton, Ohio, held a meeting in Cincinnati on Feb. 15 and 16 that would have done credit to the National Meter Committee with an attendance of over 200 and great enthusiasm shown. The Prime Movers, Inductive Coordination, Overhead-Underground Systems Committees and Accounting Section have all had splendid meetings, at which a great amount of information was brought out.

Committee work in the division is being hurried a little more than in past years for the reason that our annual convention will be two months earlier this year than it has in the past. For many years the convention has been held in July at Cedar Point. This year the location was changed to Louisville, Ky., and in order to escape the hot weather of the South, the dates had to be moved up two months. This necessitates the close of the work of the standing committees two months earlier than usual, but all chairmen have promised to be ready for the convention.

The Power Survey of the East Central Division is now being distributed, and it is truly a work of art. This survey was nearly three years in preparation and justifies the amount that has been spent thereon.

Taking it all in all, the East Central Division was never in better shape and promises to do its full part for the year closing on June 30 and have everything in readiness for another splendid year beginning July 1.

Changes in Convention Dates

THE date of the 1929 convention of the New England Division, National Electric Light Association, has been changed from Sept. 16-19 to Sept. 9-12, inclusive. It will be held at the Hotel Griswold, New London, Conn.

The fourth annual convention of the Arizona Utilities Association will be held at the El Conquistador Hotel, Tucson, Ariz., on April 4-6 instead of April 18-20, as formerly announced. Many phases of the industry will be covered during a two-day business session. A third day will be given over to a sightseeing trip.

Conference on Employee Education, Southwestern Division

One of the most profitable meetings in the Southwestern Division this year was a conference of executives and educational representatives from member companies under direction of the Educational Committee of the division, held at Dallas, Tex., Jan. 25. About 40 were in attendance, including members of the Executive Committee, which met the same day—and all took part in the discussion. Dr. H. M. Blain, Chairman of the Educational Committee, presided.

"I have learned more about employee education and the solution of its many problems than I ever expected to know, and am going back to my company and put it into practice," was the general testimony as expressed by those in charge of employee education in the principal companies of the five States represented in the division.

Fred R. Jenkins, of Chicago, Chairman of the N. E. L. A. Educational Committee, detailed the purposes, content, and handling of the N. E. L. A. courses, and answered a number of questions on the problems of the representatives present.

A. J. Sarre, Educational Director of the New Orleans Public Service, told of the organization of his department, one of the most advanced in the country, with about 1150 employees in the various courses, and also answered questions of interested listeners.

C. J. Rutland, of Texas Power & Light Co., substituted for Z. Carson of San Antonio on "The N. E. L. A. Courses in Small Companies" in a most interesting talk. E. G. Green, Educational Director of Oklahoma Gas & Electric Co., spoke on "Special Kinks in Educational Work."

"Educational Activities Among Employees from an Executive's Standpoint" was the subject of an address by L. V. Sutton, Vice-President of the Mississippi Power & Light Co., Jackson, and inspired a number of talks by other executives, all of whom took a most decided stand for employee education and especially for the N. E. L. A. courses.

WOMEN'S COMMITTEE

Miss Sophia Malicki, *Chairman* **Miss Isabell Davie**, *Secretary*

News Letter

By Mrs. Thelma Van Ness

A new Women's Committee has been organized. *Northwestern Echoes* from Huron, South Dakota, tells us that the girls of the Aberdeen division of Northwestern Public Service Company held their first meeting in December.

* * *

A very successful annual Women's Conference, North Central Electric Association, was recently held in Minneapolis. Mrs. Mabel Wilson, chairman of the division, presided. The first speaker, Mr. L. M. Pharis, President of the North Central Electric Association, spoke on Public Relations. Mr. T. D. Crocker, Assistant General Manager of the Northern States Power Company, addressed the group. Miss Val Thorson, director of Home Service, gave a talk in which she stated that a Home Service Department is indispensable in carrying out the program of the Women's Committee. Mr. John Lapham gave an illustrated talk on "How Shall We Treat the Customer?" Miss Laurene Littell spoke on "Home Lighting," and Mr. W. H. Brown, of Minneapolis, Secretary of the Inter-Divisional Safety Council of the Northern States Power Company, emphasized the importance of safety work. Other members of the Women's Committee also took part in the program. This group is to have a news sheet entitled *Northern Lights* which will consist of news from the Women's Committees of the North Central Electric Association.

* * *

The Kentucky Women's Committee held a meeting during the recent convention of the Kentucky Association of Public Utilities at Louisville. Mrs. Beulah K. Yewell is chairman. About seventy-five girls were in attendance at the meeting.

* * *

The Synchronizer, company magazine of the Louisville Gas and Electric Company, will be edited by the Women's Committee in March of this year.

* * *

Mrs. Nell Laws, Chairman of the Women's Committee, Northwest Division, reports the Third Annual Conference of Women's Committees, Puget Sound Power and Light Company, held in Seattle, November, as an all-day session. All districts reported keen interest in Women's Committee work and splendid cooperation from the management. The work of the district committees was fully discussed and helpful ideas were exchanged.

* * *

The Women's Committee of the Washington Water Power Company, Spokane, presented the playlet, Wanted—A Stenographer, before the members of the Business and Professional Women's Club at its state banquet held in Spokane recently. This playlet illustrates many of the standards which the organization advocates for the business girl and was most favorably received by the members.

* * *

The appointment of Mrs. Mae H. Redd as Chairman, Women's Committee, National Electric Power Company, 57 William Street, New York, N. Y., was made by Mr. Harry Reid, President, last fall. Mrs. Redd's activities will include the organization of Women's Committees in properties of the National Electric Power Company, where none now exist, and the stimulation and coordination of programs of Committees already functioning. Mrs. Redd's duties will take her into the fourteen states in which her company operates.

* * *

A novel idea was initiated by the merchants in Wenatchee, Washington, this past holiday season when they decided on December 7 as the evening when all the townsfolk would be invited to "Open House" at the various business houses for the purpose of getting their ideas for Christmas shopping, although nothing was to be sold.

* * *

The Women's Committee of Puget Sound Power & Light Company, Wenatchee, decided that this was an opportunity for them to do something constructive, so they used this date to put on an Appliance Demonstration in the company salesroom. The committee is composed of only eight members and therefore it was necessary for each to have a very definite assignment. One member greeted the guests at the door and all who cared to register were given a chance on a toaster. Punch was served in connection with the electric refrigerator, others served waffles and syrup. Another demonstrated the electric ironer. The secretary of the committee presided at the coffee urn and demonstrated the toasters, serving toast and jam with the coffee. One member demonstrated the electric corn popper, and her table proved most popular with the kiddies.

The chairman of the committee took an active part in the demonstration. In addition to giving talks on the electric cooker, in which were displayed roast and vegetables, she also mixed waffle batter, made coffee, and kept things moving generally. The Wenatchee paper stated that the Puget Sound Power & Light Company's salesroom was the most popular place in town the evening of "Open House." In spite of very cold weather, about three hundred people were served.

* * *

The Public Utilities of West Virginia held their annual convention at Huntington recently and the Women's Committee took quite an active part. Mrs. Luella Fisher, Chairman of Home Service, American Gas Association, was the main speaker. She gave a very interesting talk on Opportunities for Women in Business. Miss Esther Rockey, Chairman, East Central Division, addressed the group and Miss Margaret Schneider, West Virginia

Chairman, gave a report. The playlet, Electrified Eliza was presented.

* * *

The Monongahela West Penn Women's Committee has made up programs for the year. Meetings are to be held once every two months consisting of a talk by one of the executives of the different departments and possibly a playlet put on by some of their own girls. It is their aim to invite a number of the executives' wives to each meeting.

* * *

Another bulletin has appeared. The Women's Committee of the Lake Superior District Power Company and the Michigan Gas and Electric (Northern) Company, with Miss Skulda Baner as editor, has published the first number which is a very comprehensive paper containing several pages of interesting short subjects on the utility industry.

* * *

The Women's Committee of Consumers Power Company, Michigan, held its semi-annual meeting recently in Jackson. District chairmen were present from the fifteen districts. The most important conference was held on Saturday morning at which health promotion and safety work received a great deal of consideration.

* * *

The Saginaw girls—also Consumers Power Company, Michigan—were hostesses at a Home Economics Matinee on the afternoons of Nov. 15 and 16 in the Saginaw office building. Twenty girls took part in an appliance demonstration during the afternoon of these two days, using an electric ironer, electric washer, waffle irons, toasters and percolators. More than five hundred visitors were received. Waffles, cinnamon and chocolate toast and coffee were served to the guests.

* * *

The Women's Committee of the Washington Water Power Company at Spokane served electrically popped corn to a Business and Professional Women's Club meeting recently.

* * *

The Women's Committee, Menomonie and Marinette Light and Traction Company, sponsored a safety demonstration before the Epiphany School and the Legion Auxiliary at Menomonie, Wis.

* * *

The Wisconsin Public Service Corporation women gave a cooking demonstration to two hundred guests representing the Catholic Women's Club at Oconto. They also put on the playlet, Let's Stay Married, before the Parent-Teacher Associations of Green Bay, St. Willebrord and Oconto and the Grace Lutheran Society at Green Bay. They also held a safety demonstration at Green Bay.

* * *

An interesting lighting feature was a Lighting Tea given by the Women's Committee of the Monongahela West Penn Public Service Company of Fairmont, West Virginia. In response to invitations sent to club women of Fairmont, two hundred persons attended. A talk on Home Lighting was given, the pantomime Evolution of Lighting, also. Copies of *Better Lighting* of the *More Power to the Home* series were distributed to guests. Wives of the executives of the company presided at the tea tables and assisted with the serving.

* * *

Miss Helen A. Smith of the Rochester Gas and Electric Corporation, Rochester, N. Y., reports that among her lamp shade classes is a Saturday morning children's class.

* * *

A home lighting course has been arranged by Miss Mary Wren Steward of the Union Gas and Electric Company, Cincinnati, Ohio, for the girls of her company. Each course will be four weeks long and classes will be held from five to six one day a week. The first lesson will consist of a short lecture telling of the purpose of the home lighting department and taking orders for lampshades. Twenty-five girls are enrolled for this first course and they will be given free of charge the material for a tailored parchment shade. The second lesson will consist of a one-half hour lecture showing proper lighting for different living room arrangements and the last part of the course, the girls will start their shades. The next two lessons will take the various rooms in the home in the same manner as they did the living room. Another course for another twenty-five girls will follow this first one and so on throughout the year.

* * *

The Consumers Power Company, Michigan, Women's Committee, at Owosso, entertained the Women's Club of that city recently, by presenting the pageant, The Evolution of Light.

* * *

The girls of the Lake Superior District Power Company at Ironwood, Michigan, have organized a safety team which gave a demonstration at a meeting of the Rotary Club in that city a short time ago. Four doctors present spoke very highly of the girls' work.

* * *

Why not furnish your public library with a set of the *More Power to the Home* booklets and other educational material on the use of electricity in the home? Miss Susan M. Brandon, Home Economist, Alabama Power Co., Birmingham, sent material of this kind to the Birmingham City Library. Since the material was presented, the library has shown a window display on artificial lighting in relation to interior decoration and the librarian has reported that the material given is being used for reference.

* * *

A Program of Safety for the use of local Women's Committees has been prepared by Miss Elizabeth Lee, Chairman, Women's Safety Sub-Committee, Accident Prevention Committee, N. E. L. A. Committees wishing to include Safety studies in their programs will find suggestions for activities in this outline. Copies will be furnished upon request to the Secretary, Women's Committee, N. E. L. A., 420 Lexington Ave., New York, N. Y.

* * *

The Home Service Department of the Interstate Public Service recently held eight American Home Institutes throughout the state which were sponsored by the American Home Department of the Indiana Federation of Women's Clubs.

The programs for these meetings included talks on Laundering, Meal Planning, Sanitation in the Home, Interior Decoration, Home Lighting and Lamp Shade Making and demonstrations of other electrical appliances.

* * *

Here are five recommendations to be followed by Women's Committees in the Middle West Division during this Association year, as announced by the Chairman, Miss Betty Ewing:

1. Know the company personnel and the territory served by company.
2. Fifty per cent of the girls to deliver a talk pertinent to the industry.
3. Safety First Work:
   Twenty-five per cent to have knowledge of prone Pressure Methods of Resuscitation.
   Seventy-five per cent to have knowledge of First Aid Emergency Methods.
   One hundred per cent to have Ideal of Safety First.
4. Specific knowledge of initial and maintenance costs, operation and care of two major and five minor appliances.
5. One general meeting including wives of employees.

MAGAZINE ARTICLES

Below is a list of articles which appeared in various magazines recently that are especially interesting to Women's Committee members:

Modern Priscilla—February.
What Electrical Equipment Shall We Buy?—Eloise Davison.
Your Home—February.
Let There Be Light—From Distinctive Fixtures—Helen Anderson Storey.
Delineator—February.
Little Things That Matter.
Good Housekeeping—February.
Housekeepers Discuss Dishwashing Machines With the Institute—Helen M. Whitson.
Newer Standards In Home Comfort—P. E. Fansler.
People's Home Journal—February.
Electrical Psychology in the Home—Donald A. Laird, Ph. D., Sci. D.
Short Cuts in Home Making—Emma F. Holloway.
Pictorial Review—February.
Safe Refrigeration—Helen Treyz Smith.
Ladies' Home Journal—February.
Women and World Peace—Mrs. John F. Sippel.

Picked up from

ELECTRICAL NEWS ITEMS

Issued weekly by Department of Public Information, National Electric Light Association, 420 Lexington Avenue, New York City. All or part may be used without further notice and with or without credit being given.

Farmers Subsidized at Expense of Taxpayers

SOME interesting facts concerning results of attempting to subsidize the farmer at the expense of the taxpayers generally by the Hydro-electric Power Commission of Ontario are set forth in an interesting article by William M. Carpenter, appearing in the *Annalist*. One half of the cost of constructing rural power lines is paid out of the Provincial treasury and this cost cannot apparently be reflected in the rates.

"On October 31st, 1927," says Mr. Carpenter, "there were 9,757 farms (out of a total of perhaps 160,000 in a territory covered by 'Hydro' operations) which enjoyed the benefits of electric service; in addition there were also some other 15,526 consumers living in hamlets. To bring electricity to these rural areas, over 3,000 miles of lines were built, and for this construction the Province of Ontario granted, from the public treasury (and, therefore, out of general taxation) one half of all the costs, and has supplied a total sum of $3,332,286."

In other words, the general taxpayers have paid approximately $135 to supply service to each one of these individual consumers in rural districts. If this same policy should be adopted in the United States one wonders just how much our own Treasury Department would have to pay out if we add to the 350,000 electrified farms all of the consumers in hamlets which have received service because of electrification of rural areas and multiplied the total by $135? It is safe to assume that it would run into many billions.

Municipal Competitor Objects to Private Company Lowering Rates

IN the face of the constant reiteration on the part of advocates of government ownership and operation of public utilities that municipal plants always furnish light and power at rates lower than those of the privately owned companies it is something of a shock to learn that the managers of a municipal electric light plant have actually demanded, through the medium of the courts, the establishment of a *minimum rate* and have been granted a decision to the effect that a private company cannot charge *less* than that rate.

Out in Iowa the Iowa Public Service Company—privately owned and operated—reduced its rate. It had been getting 13 cents a kilowatt-hour and decided that 12 cents was enough. But the operators of the municipal plant at Mapleton, Iowa, thought differently. They were getting 13 cents, wanted to continue to do so, and did not propose to compete with any private company furnishing service for 12 cents.

A city ordinance granting a franchise to the Iowa Public Service Company, fixes the rate at 13 cents a kilowatt-hour. The whole scheme of government regulation of public utilities is that a maximum rate which will pay a reasonable return on the value of the property in use in the public service shall be fixed and the company can charge no more. If the rate charged is *lower* than this maximum rate it is a matter between the public utility and its customers.

But the municipal ownership folks in Iowa interpret the idea of government control and regulation quite differently. They claimed that if the rate was fixed at 13 cents it had to be 13 cents even though the public service corporation is willing to furnish service for less. Apparently they have proved it for the Iowa Supreme Court has decided, in a five to two decision, that the utility company must charge the citizens of Mapleton 13 cents a kilowatt-hour.

According to the Des Moines Register of February 13th the Court also held that a public utility operating under a franchise, such as was issued to the Iowa Public Service Company, has no constitutional right of competition. The question immediately arises as to how the privately owned and operated public utility can furnish service at a rate which will not exceed a reasonable return on the value of the property in use in the public service if the advocates of municipal ownership and operation can go into court and force it to charge a higher rate.

Electric Traffic Cops

NOT only have scientists developed the photo-electric cell to the point where it will take the place of traffic policemen but it can also avoid many unnecessary traffic delays. This was demonstrated recently at the New York Electrical Society by Dr. H. H. Sheldon, professor of physics at New York University, and Dr. Phillips Thomas, research engineer of the Westinghouse laboratories who is the "father" of the new robot.

It was explained that this invention was not so much applicable to New York and other big cities as to smaller communities where there is heavy automobile traffic on main thoroughfares and little traffic on side streets and cross roads.

Under the present traffic light system, it was added, the red light frequently holds up traffic on the main road while there are no vehicles waiting on the side street. The new invention makes it possible to give the motorist on the main road a continuous green light until a car on the side street comes to within a short distance of the intersection.

This is where the automatic eye comes into play. Underneath the side street and overlaid with a "mushroom" covering so as not to obstruct traffic, lies the sleeping robot. This giant of the machine age always sleeps with one eye open, and as soon as a vehicle crosses the mushroom covering, the shadow of the vehicle falls upon the automatic eyeball and awakens the robot to electric action.

His first impulse, which is automatic and never fails, is to switch the green light to red on the main road and the red to green on the side road, so that the car which has just caught his eye may cross the main road in safety. After a brief stated interval, if no other car on the side street casts a shadow upon his vision, the robot automatically obeys his next impulse which switches traffic lights back again to their original status and lets the main line traffic proceed.

The demonstration showed how the new system could automatically set right unusual situations. For instance, if an unusually long line of cars on the side street threatened to hold up main-line traffic too long, there is a time-limit relay cog in the robot which compels him to switch the signals again to give the main line a chance for the definite period.

Year's Job to Redesign Reflector for Searchlight

WHEN it was found that the mammoth searchlight constructed in one of New York state's factories about two years after the war did not attain its calculated efficiency of one billion candle power, the problem of bringing the instrument "up to scratch" was handed to two mathematicians. Specifically, their task was to redesign the reflector. It had been proved that the carbons were performing their duty in creating an arc of approximately the same temperature as the outer surface of the sun.

It took these two men one year to figure out the answer to the problem. Their solution was so accurate that now the searchlight is recognized as one of the largest in the world with a rated capacity of one billion candle power.

WHAT OCCURRED LAST MONTH

Consolidations

Stockholders of the Buffalo, Niagara & Eastern Power Company have voted approval of consolidation of their company and others in a new company to be called the Niagara Power Corporation.

* * *

Five electric companies in the Genesee Valley, New York, have been merged with the Rochester Gas & Electric Corporation, under authorization of the Public Service Commission of New York.

* * *

On Feb. 7 it was announced that the Associated Gas & Electric Company had contracted to acquire all the stock of W. S. Barstow & Co., Inc., which owns a majority of the voting stock of the General Gas & Electric Corporation, thus bringing under a single ownership public utility properties in 18 States with assets exceeding $500,000,000.

* * *

Announcement has been made of the formation of the Empire Public Service Corporation, which will acquire six companies having assets of $35,000,000 and systems in Ohio, Maryland, Colorado, and Oklahoma.

* * *

The Foshay interests of Minneapolis have bought the Cargill, Ontario, Electric Light & Power Company.

* * *

Announcement of plans to consolidate seven electric companies in Vermont into the Central Vermont Public Service Corporation has been made by the Vermont Hydro-Electric Company.

* * *

The Canadian Bureau of Statistics in a recent report discloses that small isolated plants in Canada are being rapidly supplanted by large central generating stations and interconnected systems. The United States Bureau of Census announces that in Kentucky small, isolated plants are being replaced by interconnected systems. In 1922, 111 individual commercial systems operated in Kentucky; by 1927 this number had declined to 33.

* * *

Properties of the Inland Utilities Company in western Oklahoma and northern Texas have been bought by the Texas-Louisiana Power Company of Fort Worth. A recent announcement tells of organization of the North American Gas & Electric Company, which, through subsidiaries, will own or control properties supplying service in the State of Washington and the Province of Saskatchewan.

* * *

Federal Trade Commission's Inquiry

On Jan. 25 witnesses at the Federal Trade Commission's hearing in Washington were Judge Stephen Davis, Director of the Joint Committee of National Utility Associations, and Horace M. Davis, of Lincoln, Neb., former Director of the Nebraska Public Utilities Information Bureau. Judge Davis was asked about the publicity of the Joint Committee, and stated that its activities in distributing press releases and pamphlets had gradually decreased until they were discontinued last spring. H. M. Davis told of activities of the Nebraska Public Utilities Information Bureau.

* * *

On Feb. 16 the case of the Federal Trade Commission against the Electric Bond & Share Company was argued before Federal Judge Knox in New York, Judge John F. MacLane and the Hon. John W. Davis appearing for the company and Judge Robert E. Healy for the Commission. A principal contention of the company is that it is not engaged in interstate commerce. It further holds that the subpoenas issued by the Commission constituted warrants and were contrary to the laws of search and seizure. At the conclusion of the hearing Judge Knox gave the Commission ten days in which to file a brief and allowed the company an additional five days to file an answering brief.

* * *

Former Chairman Myers of the Federal Trade Commission, appearing before the House Appropriations Committee, stated that the approximate total investment of the gas and electric companies reporting to the Federal Trade Commission, and involved in the Commission's utilities investigation, is $14,000,000,000.

* * *

Foreign

Reports from England are to the effect that the comprehensive readjustment of electric generating stations and the interconnection of transmission lines being carried on under supervision of the Central Electricity Board and the Electricity Commission is proceeding rapidly. Contracts aggregating $75,000,000 in connection with this development are to be placed within the next few weeks.

* * *

A review issued by the Canadian Bureau of Statistics shows that during the past five years the output of electrical energy from central electric stations in Canada has almost doubled, and during the past six years it has increased 136 per cent.

* * *

A. V. Winter, chief engineer, and B. E. Vedeneev, assistant chief engineer, of the Dnieper Hydro-Electric project under construction in Russia, and six other leading Soviet technicians, have arrived in this country to study American hydro-electric development and to participate in negotiations in regard to placing orders for equipment for the Dnieper plant.

* * *

Hydro-Electric

On Jan. 26 the Cumberland Hydro-Electric Power Company filed with the Federal Power Commission a brief supporting its application for a license for development of the power at Cumberland Falls.

* * *

Senator Wagner of New York, in a letter to Governor Roosevelt, has asked the Governor to state the attitude of New York toward the treaty recently negotiated between the United States and Canada for preservation of the scenic beauty of Niagara Falls and diversion of waters of the Niagara River for power purposes. Senator Wagner asks if Governor Roosevelt favors having works for preserving the Falls undertaken at private expense and making available for private utilization the additional water to be diverted. He asks if the State claims that its consent is a prerequisite before any disposition can be made of the additional 10,000 cubic second-feet of water made available by the treaty. He asks if the State claims the right to charge for the use of this additional water. Governor Roosevelt has not answered Senator Wagner's questions, but is understood to hold that the State does claim its consent is a prerequisite before disposition can be made of the additional diverted water and does claim the right to charge rental for the same.

* * *

A report by the Federal Power Commission says that California has feasible sites for increasing present hydro-electric energy installations from 2,000,000 hp. to 10,000,000 hp.

* * *

Rates

The Knoxville, Tenn., Power & Light Company announces rates, effective March 1, which will save customers $50,000 a year.

* * *

The McCook, Neb., *Gazette* lists the following Nebraska towns as having voluntary reductions by the companies serving them: Mitchell, Scottsbluff, Minatare, Melbeta, Bayard, McGrew, Northport, Bridgeport, Broadwater, Dalton, Gurley, Lewellen, Brule, and Ogallala.

* * *

The suit of the Cambridge Electric Light Company against the order of the Massachusetts Department of Public Utilities, calling for reduction of the domestic and commercial lighting rate from 8 cents to 5½, has been withdrawn.

* * *

Special Master Henry E. Warner, appointed by the Federal court to investigate the order of the Massachusetts Department of Public Utilities reducing the domestic and commercial lighting rate in Worcester from 7 to 5 cents, has reported in favor of the 5-cent rate, but upholds completely the Worcester Electric Light Company's position in regard to reproduction cost as a basis for valuation.

* * *

The Duke Power Company has announced reduction in industrial power rates for North and South Carolina which will save consumers approximately $500,000 annually.

* * *

Regulation

The City Club of New York and the Public Committee on Power of New York State have asked Governor Roosevelt for an investigation, under the Moreland Act, of the regulation of electric companies by the Public Service Commission of New York. The New York *World* is urging a broader investigation of the whole question of utility regulation.

* * *

A bill has been introduced in the Maine Legislature calling for a study of the water-power situation in Maine by a Recess Committee of ten citizens to be appointed by the Governor.

* * *

Governor Cooper of Ohio has recommended repeal of the Pence Utility Law, which allows public utilities to put an increased rate into effect in advance of a decision from the Utilities Commission.

* * *

A bill has been introduced in the Indiana Legislature proposing that purchase, construction, and regulation of municipal utilities be taken from the jurisdiction of the Indiana Public Service Commission. Control of municipal utilities would be given solely to common councils of larger cities, town boards or trustees of smaller ones, and to joint commissions where the property is owned by more than one city or town. This bill has been indefinitely postponed. This is expected to mean that the bill will not be brought up again at the present session of the Legislature.

* * *

Three bills bearing on utilities have been introduced in the Wisconsin Legislature. One would repeal the indeterminate permit law; another would repeal the statute pertaining to the issuance of certificates of convenience and necessity, and the third would permit municipalities and cooperative associations to build and operate public utilities.

* * *

Governor Reed of Kansas, in his inaugural message, announced his intention to have the Public Service Commission make a thorough investigation of public utility rates and adjust them on a fair basis.

* * *

Governor Caulfield of Missouri has recommended legislation to facilitate the work of the Missouri Public Service Commission in making rate-base valuations.

A bill has been introduced in Texas Legislature placing utilities under the administration of the Railroad Commission. It is being opposed by the Municipal Utilities League of Texas.

* * *

Governor Patterson of Oregon has recommended that the State's existing water-power laws be amended so that the State may receive fees from all persons and corporations acquiring vested rights to the use of public waters for developing power.

* * *

A bill has been introduced in the California Legislature, proposing that State taxes be levied on municipally-owned public utilities, as well as on privately-owned utilities. Another bill which has been introduced forbids the use of public utilities' funds in California for political campaigns.

* * *

A motion has been introduced in the Maine Senate that a special committee of 21 members of the Legislature be appointed to consider the general question of exportation of hydro-electric current and all bills pertaining to it.

* * *

Senator Black of Alabama proposes that the Watson Bill, to extend the life of the Federal Radio Commission, be amended to bar ownership or operation of radio broadcasting stations by public utility corporations. He intends to introduce an amendment to that effect.

* * *

The Washington State Senate on Feb. 1 rejected the bill initiated by the Washington State Grange authorizing formation of districts which would own and operate electric systems. As the bill was before the Legislature by an initiative petition, it now goes before the voters in 1930. Another bill before the Washington Senate provides that cities owning electric plants shall have the right to sell current to other cities and towns.

* * *

A bill to create a new system of public utility taxation has been introduced in the Wisconsin Legislature.

* * *

The annual report of the Public Service Commission of New York State urges legislation which would bring utility holding companies under the jurisdiction and supervision of the Commission. It also advocates legislation to bring submetering concerns under the Commission's jurisdiction.

* * *

Bills have been introduced in both Houses of the New York Legislature providing for creation of a commission to inquire into the regulation of utilities in New York and to draft legislation to make regulation more effective.

* * *

A bill has been introduced in the Maine Legislature providing that the Governor and Council shall appoint five commissioners to represent Maine upon a joint commission including the other New England States, having the purpose of entering into a compact or treaty with the consent of Congress to cover all matters relating to the water-power resources of the States.

* * *

A bill providing for election of members of the Public Service Commission, heretofore appointed by the Governor, has been introduced in the Maryland Legislature.

* * *

Bills introduced in the Missouri Legislature include: An act calling for creation of a State Power Commission which would make a complete survey of the water-power resources of the State and prepare laws for State regulation of water power; a bill to amend the Public Service Commission Act with regard to procedure in valuing utilities, this providing that 7 per cent is to be held a fair and reasonable return on utilities' property; a bill to limit operation of municipally-owned water, gas and electric plants to the territory of the city concerned unless permission to extent is obtained from the Public Service Commission; a bill providing that a municipally-owned plant cannot be leased, sold or otherwise disposed of except by a two-thirds vote at a special election.

* * *

A committee of the Texas Senate has reported favorably a bill providing for creation of a Public Utilities Commission of three members, which would have original jurisdiction over unincorporated towns of 2000 or less, and appellate jurisdiction over incorporated towns and cities, municipal plants to be exempted.

* * *

A bill introduced in the Idaho Senate prohibits export of power from the State.

* * *

A bill introduced in the Washington House of Representatives provides that cities now or hereafter owning or operating electric plants shall have the right to sell to other cities and towns at wholesale, but does not authorize retail distribution outside city limits. Another bill introduced in the House removes the tax exemption feature from real and personal municipally-owned property in competition with private property.

* * *

On Feb. 21, the Maine Senate passed the Murchie order calling for an economic investigation of water-power export by the Joint Legislative Committee assigned to consideration of power measures.

* * *

A second bill providing for a survey of public utility regulation in New York State has been introduced in both Houses of the New York Legislature by leaders of the Republican forces. This bill calls for an Investigation Commission of nine members.

* * *

A bill before the Vermont Legislature provides for taxation of electric energy generated in the State at the rate of one mill a kilowatt-hour, with exemption after payment of 10,000,000 kilowatt-hours a year.

RELATED and other ORGANIZATIONS

Index to Standards and Tentative Standards

THE American Society for Testing Materials has recently issued a general Index to all of its Standards and Tentative Standards. This Index, which will be issued annually, should be most useful to all of those concerned with Standard specifications. Copies may be obtained free of charge by application to the American Society for Testing Materials, 1315 Spruce Street, Philadelphia, Pa.

Midwinter Meeting A. I. E. E.

AT the midwinter meeting of the American Institute of Electrical Engineers, held at New York, Jan. 28-Feb. 1, operating men, manufacturers' representatives and research investigators had an excellent opportunity to find something of interest in practically every session. Not only did the papers and discussions cover a wide field of activities, but many outstanding subjects were considered. Great progress was shown in appealing to scientific, design and operating interests by the more balanced attention given each group.

Among the papers and discussions were studies of lightning and protective measures, results of further research into the mechanism of cable breakdown and methods of preventing it, developments in high-speed circuit breakers, particularly the "Deion" breaker and experience therewith, performance and economy of the capacitor induction motor, prevention of excess voltages in transformers by a nonresonating construction, and physical tests that place commutator design on a more scientific basis were among the subjects which commanded most attention. Standard test voltages for initial installations and radio beams as guides for airplanes were also discussed.

Convention Will Reveal Oil Heating Progress

AN EXPOSITION depicting the rapid development of the oil heating industry and modern oil equipment will be one of the features of the sixth annual convention of The American Oil Burner Association to be held in The Hotel Pennsylvania in New York, April 9th, 10th and 11th.

Arrangements are being completed for an attendance of between 2,500 and 3,000 delegates, representing the oil heating industry and allied industries in all parts of the United States and Canada.

Elliott Harrington, of the Industrial Engineering Department of the General Electric Co., will speak on the subject of "The Part Electricity Plays in the Operation of Domestic Oil Burners."

National Chamber of Commerce Meeting

THE National Chamber of Commerce Seventeenth Annual Meeting will be held in Washington, D. C., April 30 to May 3, 1929, preceded by a meeting of the National Councillors on April 29.

Western Pennsylvania Engineers Banquet

SEVERAL hundred engineers attended the 48th annual banquet of the Engineers' Society of Western Pennsylvania held at the William Penn Hotel, Pittsburgh, Pa., Feb. 4. The speakers of the evening were Messrs. Charles Cason, and Paul S. Clapp. Mr. Frank R. Phillips was toastmaster. Mr. J. N. Chester is president of the society.

THE IDEA MILL

Moisture-Tight Containers for the Shipment of Transformer Oil

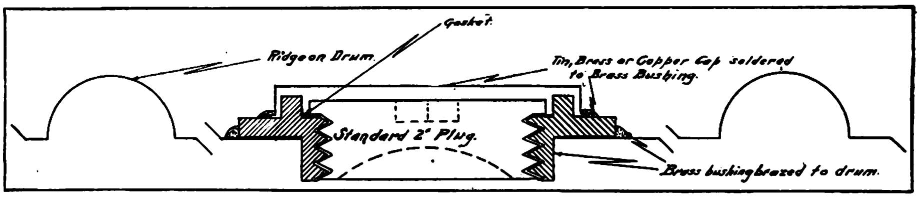
By J. E. Busher*

TRANSFORMER oil shipped in drums is very likely to absorb moisture during shipment or storage. This is very readily admitted by the manufacturer, who claims that with the present type of seal on oil drums, it is impossible to seal out moisture and the only way oil can be shipped to insure a high dielectric strength is to ship it in tin containers with a soldered seal.

Our experience during the last year has been that transformer oil received in drums, in most cases, has shown a very low dielectric strength due to the fact that moisture was present in the oil. Fortunately, it has been our policy to always test the oil before it was put into electrical apparatus. Possibly some of the smaller companies do not make this check, assuming that the oil as received from the manufacturer is in good condition. I feel that where this has been done, oil with too low a dielectric strength has, in a good many instances, been put into high voltage apparatus. Operating companies and industries using transformer oil should insist that such oil be shipped in containers that will absolutely guarantee the oil being received is in a condition suitable for immediate use without any doubt as to its high dielectric strength.

Oil that we tested after shaking the drum up and taking a sample out of about the middle of the drum has broken down, under test, at as low as 10,000 kv. It is our practice never to use oil with a lower dielectric strength than 22,000 kv. and the bringing of the oil up from 10,000 kv. to 22,000 kv. has been a considerable expense and annoyance, which could have been avoided if the oil drums had been properly sealed.

The sketch shows how this could be done by the manufacturer so that oil with a high dielectric strength can be insisted upon by the operating companies, which I feel should be done.



Gasket.
Ridgeon Drum.
Tin, Brass or Copper Cap soldered to Brass Bushing.
Standard 2" Plug.
Brass bushing brazed to drum.

---

*Superintendent, Electric Station Construction Department, Kansas City Power & Light Company.

A Tip for Advertisers

FREE advertising service is being offered by the Electrical League of Colorado to those building and selling houses in that State. The offer of the organization is being broadcast to builders and owners of houses that are wired according to the minimum Red Seal specification.

The announcement of this idea for cooperation specifies that the league will pay the cost of a six-line classified advertisement featuring the sale of a Red Seal house for the period of one week, including Sunday. Four lines of each ad may be used to describe the type of construction, number of rooms, location, price, terms, and to list the name and address. The remaining two lines are to be used by the league to call attention to the adequate electrical installation. The only provision is that the house offered for sale must have at least the minimum Red Seal requirements. All copy for such advertising is to be submitted to the league, which will, in turn, place the order with the paper that the builder or seller suggests.

THE REVIEWING STAND

Prometheus U. S. A. By Ernest Greenwood.

Harper & Bros., New York. 250 pages. Price $2.50.

BEGINNING with the tales of fire as they are chronicled in myths, legends and the history of its uses down through the ages, Mr. Greenwood considers in this book the modern methods of using fuels and their relative merits in industry and home. He has collected a large amount of material on oil, gas and electric light and power and has been able to sketch the picture of the distribution of these agencies for their multitudes of present-day employments. "Automatic heat," he summarizes, "is the latest achievement of man in employing fire for his comfort and for industrial purposes."

Mr. Greenwood will be remembered as the author of "Aladdin, U. S. A.," published last year by Harper & Brothers also, which gave a very informative picture of the electric light and power industry and its contributions to civilization. While the book is written in an interesting style it is far from a light vein in which the author discusses the many subjects contained in "Prometheus, U. S. A." Wood is referred to as the first fuel and one of the bulwarks on which this country was built. Facts are given on the supply of wood now available and what is being done to assure a continuing supply for future generations, pointing out that wood is no longer to be considered as a major fuel.

In one chapter Mr. Greenwood writes, "* * * to coal goes the credit for building the very foundations of American industry and it will be a long, long time before it is entirely replaced by oil, water power or some synthetic fuel of the future.

"Without coal, our transportation system, the greatest in the world, would still be in its early stages of development. Coal was an important necessity in the smelting of iron so necessary for the rails and the equipment of our railroads. Wood was the only kind of fuel that was available in the early days; how far would our railroads have travelled if they had had to depend on wood? Coal was an absolute necessity to run the industries which eventually produced the machinery from which our water-power generating plants are built. Until very recently, coal has been the only efficient fuel for use in the 'central fire' in the cellar by means of which we have been able to heat our houses all over, from cellar to garret. Coal has produced the steel as well as the cement for our modern structures, whether office buildings or factories; almost the sum total of modern construction in America is nothing more or less than a monument to coal."

The gas industry is discussed, in some detail the author citing instances of the early discovery of gas and the difficulties that attended its commercial introduction in the last century in England and America. He includes a considerable amount of statistical information about the industry as it exists in this country today, pointing out that, as is the case with the light and power companies, gas companies necessarily are monopolies in the communities they serve. Other sections of this discussion deal with who owns the gas companies; coal as direct fuel and as raw material for making gas; coke and other by-products.

Most of the information that has been assembled in "Prometheus" on wood, gas and coal was designed to lead up to the petroleum industry. It is to this subject that Mr. Greenwood devotes the major part of his book. Not only does he tell about this feul *per se*, but he compares it with other fuels. Perhaps the most interesting chapter is "The Battle of the Fuels", with "What Price Heat" next in interest because of the controversies involved. It is here that the author deals with the efficient translation of fuels into heat and power and not only raises the many questions as to what sort of fuel is best suited for various needs but he also looks into the future and analyzes the possibilites that the next few years may bring to light.

"Prometheus, U. S. A." is a welcome addition to the ever-growing library of works that deal with Industrial America. —R. S.

Symposium on Electrical Advertising.

Serial Report, Electrical Advertising Committee, Commercial National Section, N.E. L.A. Publication No. 289-9, 130 pp., 54 illustrations, 4 tables. Price, $1.85; to members, $1.25.

THIS REPORT is based on the lectures delivered at the N. E. L. A. Electrical Advertising Courses held in March, 1928. It contains a great deal of valuable information for companies and individuals confronted with problems in electrical sign advertising.

The report consists of three parts. Part I deals with electrical sign advertising from the commercial point of view. Part II deals with technical matters, and Part III with accessories. —E. K.

Summary of Public Utility Commissioner Rules and Regulations for Electricity Meters.

Serial Report, Meter Committee, Engineering National Section, N.E.L.A. Publication No. 289-40, 20 pp. Price, 40 cents; to members, 25 cents.

RULES and regulations for electricity meters have been adopted in twenty-one States and the District of Columbia. In order to show clearly the similarities and differences in the service rules so far adopted by State commissions, abstracts of these rules have been segregated under appropriate headings in this report.

An attempt has been made to place the abstract of each rule under the heading best describing the subject matter of the rule. It is believed that all the rules of each commission have been abstracted and included in this report. To determine what each State's rules are, it is necessary only to read each under heading the abstract of the rules for the State in question. If no abstract is given, no rule has been adopted.

The purpose of the report is, obviously, to acquaint individuals interested in meters with the rules in effect throughout the country. It is hoped that Meter Committee members and other interested in these rules may take the necessary steps to eliminate some of the existing differences, and that ultimately the rules in all the States may become standardized.—E. K.

Electric Power Survey of Ohio, West Virginia and Kentucky.

By Power Survey Committee, East Central Division, N.E.L.A. 59 pages, with numerous illustrations, graphs and maps. Single copies, $1 each. Five or more, 50 cents each. Order from D. L. Gaskill, secretary. East Central Division, N.E.L.A., 603 Broadway, Greenville, S. C. To be reviewed next month.

Recent Serial Reports

Since the January issue of the N. E. L. A. BULLETIN, the following Serial Reports of N. E. L. A. Committees have been published:

		Price	To Members
	Electrical Advertising Committee		
289- 9	Symposium on Electrical Advertising.	$1.85	$1.25
	Electrical Apparatus Committee		
289-37	Progress in Generator Design & Practice	.45	.30
	Meter Committee		
289-39	Low Tension Metering Installations...	.15	.10
	(Meter Committee)		
289-40	Summary of Public Utility Commission Rules and Regulations for Electricity Meters	.40	.25
	Overhead Systems Committee		
289-16	Recommended Practices for Design & Construction of Rural Lines.......	.40	.25
	Prime Movers Committee		
289-28	Power Station Chemistry	.40	.25
	Rural Electric Service Committee		
289-12	Developing Electric Service for the Farm as Exemplified by the Organization and Methods of the Wisconsin Power & Light Co.	.25	.15

A more complete list appears on inside covers of this issue of the N. E. L. A. BULLETIN.

Orders should be addressed to the Sales and Order Department, National Electric Light Association, 420 Lexington Avenue, New York City.

Member Companies of the National Electric Light Association

(Continued from last month)

THE lists appended hereto present the names of the member companies of the National Electric Light Association as of Jan. 1, 1929, with the exception of Classes A and D, which appeared in the January issue. They are classified as follows:

Class A	(Light and power companies)	755
Class D	(Manufacturers)	416
Class F	(Associate companies)	402
Class H	(Foreign)	128
		1,701

In addition to its member companies, the Association has 18,944 individual members, classified thus:

Class B	(Employees of light and power companies)	15,192
Class C	(Invited members)	113
Class E	(Employees of manufacturer companies)	2,867
Class G	(Employees of associate companies)	710
Class I	(Foreign individual members)	62
		18,944

Total all classes of members, 20,645.

The names of the light and power companies invariably are listed at the principal place of production or distribution of energy. Where the general office of any company is located at some other point, the address of the general office is shown immediately following the name of the company.

Light and power companies (Class A) were listed last month, followed by companies or firms engaged in the manufacture of electrical apparatus or equipment for the production or use of electrical energy (Class D). Companies or firms of electrical jobbers, contractors, dealers, electrical or mechanical engineers, publishers, associations or others, corporations or individuals who are interested in advancing the use of electrical energy (Class F) are listed herewith followed by individuals or corporations not residents of North America engaged in the central station industry, or interested in advancing the use of electrical energy (Class H).

Associate Companies

(Class F)

"Class F members shall be companies or firms of electrical jobbers, contractors, dealers, electrical or mechanical engineers, publishers and associations—corporations or individuals—who are interested in advancing the use of electrical energy and are not engaged in its production or distribution."—*Constitution, Art. III, Sec. 7.*

Alabama

Birmingham—J. H. Taylor, Comm. of Public Safety.
(4th Avenue at 19th Street)

California

Emeryville—Garner Electric Manufacturing Company.
Los Angeles—Bent Concrete Pipe Company.
(419 Grosse Building)
R. G. Campbell Electric Company
(114 East Fourth Street)
Clapp & LaMoree
(1325 San Julian Street)
Detrick-Joslyn Company
(110 North Alameda Street)
Electrical Products Claude Neon, Inc.
(1122 Venice Boulevard)
Everhot Electric & Manufacturing Company
(116 Llewellyn Street)
Farnham & Cunningham
(307 South Hill Street)
Graham-Reynolds Electric Company

N. E. L. A. committee reports constitute a unique body of experiece data, compiled and revised as progress requires by a body of volunteer workers who are authorities in their respective fields. Taken as a whole these reports constitute the opeating history of the electrical industry in the United States.

The value of engineering committee reports is attested by a steady stream of orders from all parts of the world. Engineers abroad recognize the leadership of the American electrical industry and look to the reports of N. E. L. A. engineering committees for guidance.

The attention of all concerned is invited to the list of N. E. L. A. publications which appears on pages 4 and 5 of this issue.

Middle West—RALPH T. SMALLEY, Kansas Electric Power Co., Lawrence, Kan.

New England—IRVIN W. DAY, The Connecticut Light & Power Co., Waterbury, Conn.

North Central—L. M. PHARIS, Minnesota Power & Light Co., Duluth, Minn.

Northwest—R. M. BOYKIN, Puget Sound Power & Light Co., Seattle, Wash.

Pacific Coast—PAUL M. DOWNING, Pacific Gas & Electric Co., San Francisco, Cal.

Rocky Mountain—CLARE N. STANNARD, Public Service Co. of Colorado, Denver, Colo.

Southeastern—C. A. COLLIER, Georgia Power Co., Atlanta, Ga.

Southwestern—J. G. HOLTZCLAW, Gulf States Utilities Co., Beaumont, Tex.

PUBLIC POLICY COMMITTEE

Chairman, R. H. BALLARD, Southern California Edison Co., Los Angeles, Cal.

Vice-Chairman, W. W. FREEMAN, Columbia Gas & Electric Corp., New York, N. Y.

P. S. ARKWRIGHT, Georgia Power Co., Atlanta, Ga.

HENRY G. BRADLEE, Stone & Webster, Inc., Boston, Mass.

N. F. BRADY, The New York Edison Co., New York, N. Y.

B. C. COBB, Allied Power & Light Corp., New York, N. Y.

FRANK L. DAME, The North America Co., New York, N. Y.

J. E. DAVIDSON, Nebraska Power Co., Omaha, Neb.

HENRY L. DOHERTY, Henry L. Doherty & Co., New York, N. Y.

ALEX DOW, The Detroit Edison Co., Detroit, Mich.

CHARLES L. EDGAR, The Edison Electric Illuminating Co., Boston, Mass.

HALFORD ERICKSON, Byllesby Engineering & Management Corp., Chicago, Ill.

P. G. GOSSLER, Columbia Gas & Electric Corp., New York, N. Y.

A. R. GRAUSTEIN, International Paper Co., New York, N. Y.

FRANKLIN T. GRIFFITH, Portland Electric Power Co., Portland, Ore.

C. E. GROESBECK, Electric Bond & Share Co., New York, N. Y.

EDWIN GRUHL, The North American Co., New York, N. Y.

A. F. HOCKENBEAMER, Pacific Gas & Electric Co., San Francisco, Cal.

MARTIN J. INSULL, Middle West Utilities Co., Chicago, Ill.

SAMUEL INSULL, Commonwealth Edison Co., Chicago, Ill.

WALTER H. JOHNSON, The Philadelphia Electric Co., Philadelphia, Pa.

W. A. JONES, Henry L. Doherty & Co., New York, N. Y.

JOHN W. LIEB, The New York Edison Co., New York, N. Y.

THOMAS W. MARTIN, Alabama Power Co., Birmingham, Ala.

THOMAS N. MCCARTER, Public Service Electric & Gas Co., Newark, N. J.

JOHN B. MILLER, Southern California Edison Co., Los Angeles, Cal.

SIDNEY Z. MITCHELL, Electric Bond & Share Co., New York, N. Y.

THOMAS E. MURRAY, The New York Edison Co., New York, N. Y.

J. J. O'BRIEN, H. M. Byllesby & Co., Chicago, Ill.

J. F. OWENS, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

R. F. PACK, Northern States Power Co., Minneapolis, Minn.

A. W. ROBERTSON, Westinghouse Electric & Manufacturing Co., New York, N. Y.

MARSHALL E. SAMPSELL, Central Illinois Public Service Co., Chicago, Ill.

H. T. SANDS, Electric Bond & Share Co., New York, N. Y.

PAUL A. SCHOELLKOPF, The Niagara Falls Power Co., Niagara Falls, N. Y.

M. S. SLOAN, The New York Edison Co., New York, N. Y.

FRANK W. SMITH, The United Electric Light & Power Co., New York, N. Y.

R. P. STEVENS, Allied Power & Light Corp., New York, N. Y.

FRANK M. TAIT, The Dayton Power & Light Co., Dayton, Ohio.

A. W. THOMPSON, The United Gas Improvement Co., Philadelphia, Pa.

GEORGE N. TIDD, American Gas & Electric Co., New York, N. Y.

HERBERT A. WAGNER, Consolidated Gas, Electric Light & Power Co., Baltimore, Md.

OWEN D. YOUNG, General Electric Co., New York, N. Y.

Public Relations National Section Representatives

JOHN F. GILCHRIST, Commonwealth Edison Co., Chicago, Ill.

T. A. KENNEY, Allied Power & Light Corp., New York, N. Y.

GUY W. TALBOT, Pacific Power & Light Co., Portland, Ore.

GEOGRAPHIC DIVISIONS STATE ASSOCIATIONS

CANADIAN DIVISION

(*Entire Dominion of Canada*)

Canadian Electrical Association

President, P. S. GREGORY, The Shawinigan Water & Power Co., Montreal, Can.; *Secretary*, H. M. LYSTER, Room 712, Power Bldg., Montreal, Can.

(*This Division Has No State [Provincial] Section*)

*EASTERN DIVISION

(*New Jersey, New York, Pennsylvania*)

President, F. R. PHILLIPS, Duquesne Light Co., Pittsburgh, Pa.; *Managing Director*, A. B. MILLAR, Telegraph Bldg., Harrisburg, Pa.

Empire State Gas and Electric Association

President, CHARLES S. RUFFNER, Mohawk-Hudson Power Corp., Albany, N. Y.; *Secretary*, CHARLES H. B. CHAPIN, 5618 Grand Central Terminal Bldg., New York, N. Y.

New Jersey Electric Association

President, C. H. HOWELL, Atlantic City Electric Co., Atlantic City, N. J.; *Secretary*, S. F. DELANY, Atlantic City Electric Co., Atlantic City, N. J.

Pennsylvania Electric Association

President, F. R. PHILLIPS, Duquesne Light Co., Pittsburgh, Pa.; *Managing Director*, A. B. MILLAR, Telegraph Bldg., Harrisburg, Pa.

EAST CENTRAL DIVISION

(*Kentucky, Ohio, West Virginia*)

President, C. S. MACCALLA, Pennsylvania-Ohio Power & Light Co., Youngstown, Ohio; *Secretary-Treasurer*, D. L. GASKILL, 603½ Broadway, Greenville, Ohio.

Kentucky Association of Public Utilities

President, SAMUEL RIDDLE, Louisville Railway Co., Louisville, Ky.; *Secretary*, E. F. KELLY, Louisville Railway Co., Louisville, Ky.

Public Utilities Association of West Virginia

President, A. C. SPURR, Wheeling Traction Co., Wheeling, W. Va.; *Secretary*, A. BLISS MCCRUM, Box 1483, Charleston, W. Va.

GREAT LAKES DIVISION

(*Illinois, Indiana, Michigan, Wisconsin*)

President, J. E. JOHNSON, Illinois Power & Light Corp., Chicago, Ill.; *Secretary*, TOM C. POLK, 910 Marquette Bldg., Chicago, Ill.

Illinois State Electric Association

President, JULIUS L. HECHT, Public Service Co. of Northern Illinois, Chicago, Ill.; *Secretary-Treasurer*, GEORGE W. SCHWANER, 205 Illinois Mine Workers Bldg., Springfield, Ill.

Indiana Electric Light Association

President, NORMAN A. PERRY, Indianapolis Power & Light Co., Indianapolis, Ind;. *Secretary-Treasurer*, WILLIAM STOKES, 1548 Consolidated Bldg., Indianapolis, Ind.

Michigan Electric Light Association Section

President, HOWARD PETT, Consumers Power Co., Jackson, Mich.; *Secretary-Treasurer*, HERBERT SYLVESTER, The Detroit Edison Co., Ann Arbor, Mich.

Wisconsin Utilities Association

President, C. R. PHENICIE, Wisconsin Public Service Corp., Green Bay, Wis.; *Executive Secretary*, JOHN N. CADBY, Room 203, University Bldg., 432 Broadway, Milwaukee, Wis.

*MIDDLE ATLANTIC DIVISION

(*To Consist of Delaware, District of Columbia, Maryland, Virginia*)

Maryland Utilities Association

President, H. T. CONNOLLY, Washington, Baltimore & Annapolis Electric Railroad Company, Baltimore, Md.; *Secretary*, D. E. KINNEAR, United Railways & Electric Company, Baltimore, Md.

Public Utilities Association of Virginia

President, A. W. HIGGINS, Virginia Public Service Co., Charlottesville, Va.; *Secretary*, A. B. TUNIS, 301 East Grace Street, Richmond, Va.

MIDDLE WEST DIVISION

(Iowa, Kansas, Missouri, Nebraska)

President, RALPH T. SMALLEY, Kansas Electric Power Co., Lawrence, Kan.; *Managing Director,* THORNE BROWNE, 1527 Sharp Bldg., Lincoln, Neb.

Iowa Section

President, C. S. MACY, Iowa Power & Light Co., Adel, Iowa; *Secretary-Treasurer,* H. E. WEEKS, Tri-City Railway & Light Co., Davenport, Iowa.

Kansas Section

President, FRANK M. STONE, Kansas Utilities Co., Fort Scott, Kan.; *Secretary,* H. LEE JONES, 820 Kansas Avenue, Topeka, Kan.

Missouri Association of Public Utilities

President, A. E. REYNOLDS, Springfield Gas & Electric Co., Springfield, Mo.; *Secretary-Treasurer,* F. D. BEARDSLEE, 315 North Twelfth Street, St. Louis, Mo.

Nebraska Section

President, C. W. AMIDON, Central Power Co., Grand Island, Neb.; *Managing Director,* THORNE BROWNE, 1527 Sharp Bldg., Lincoln, Neb.

NEW ENGLAND DIVISION

(Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont)

President, IRVIN W. DAY, The Connecticut Light & Power Co., Waterbury, Conn.; *Secretary,* MISS O. A. BURSIEL, Room 1113 Statler Bldg., 20 Providence Street, Boston, Mass.

(This Division Has No State Sections)

NORTH CENTRAL DIVISION

(Minnesota, North Dakota, South Dakota)

North Central Electric Association

President, L. M. PHARIS, Minnesota Power & Light Co., Duluth, Minn.; *Secretary,* JOHN W. LAPHAM, 803-804 Plymouth Bldg., Minneapolis, Minn.

(This Division Has No State Sections)

NORTHWEST DIVISION

(Alaska, Idaho, Montana, Oregon, Utah, Washington)

Northwest Electric Light and Power Association

President, R. M. BOYKIN, Pudget Sound Power & Light Co., Seattle, Wash.; *Secretary,* BERKELEY SNOW, Room 1206, Spaulding Bldg., Portland, Ore.

(This Division Has No State Sections)

PACIFIC COAST DIVISION

(Arizona, California, Hawaii, Nevada, Philippine Islands)

Pacific Coast Electrical Association

President, PAUL M. DOWNING, Pacific Gas & Electric Co., San Francisco, Cal.; *Secretary,* SAMUEL H. TAYLOR, Suite 729-730, 447 Sutter Street, San Francisco, Cal.

Arizona Utilities Association

President, M. A. POOLER, Tucson Gas, Electric Light & Power Co., Tucson, Ariz.; *Secretary,* L. C. MCCULLOUGH, 134 South Central Avenue, Phoenix, Ariz.

ROCKY MOUNTAIN DIVISION

(Colorado, New Mexico, Wyoming)

President, CLARE N. STANNARD, Public Service Co. of Colorado, Denver, Colo.; *Secretary,* O. A. WELLER, Public Service Co. of Colorado, Denver, Colo.

The Colorado Utilities Association

President, V. L. BOARD, Public Service Co. of Colo., Denver, Colo.; *Secretary,* O. A. WELLER, Public Service Co. of Colo., Denver, Colo.

New Mexico Utilities Association

President, W. W. NIELSEN, New Mexico Power Co., Santa Fe, N. M.; *Secretary-Treasurer,* BERNARD L. WILES, Albuquerque Gas & Electric Co., Albuquerque, N. M.

Wyoming Utilities Association

President, W. D. JOHNSTONE, Mountain States Power Co., Casper, Wyo.; *Secretary,* F. A. PROBST, Mountain States Telephone & Telegraph Co., Casper, Wyo.

SOUTHEASTERN DIVISION

(Alabama, Cuba, Florida, Georgia, North Carolina, South Carolina, Tennessee, Porto Rico)

President, C. A. COLLIER, Georgia Power Co., Atlanta, Ga.; *Secretary,* C. M. KILIAN, 207-8 Bona Allen Bldg., Atlanta, Ga.

SOUTHWESTERN DIVISION

(Arkansas, Louisiana, Mississippi, Oklahoma, Texas)

President, J. G. HOLTZCLAW, Gulf States Utilities Co., Beaumont, Tex.; *Secretary,* S. J. BALLINGER, San Antonio Public Service Co., San Antonio, Tex.

Arkansas Utilities Association

President, W. E. BANN, Southwestern Gas & Electric Co., Texarkana, Tex.; *Secretary,* R. I. BROWN, Arkansas Central Power Co., Little Rock, Ark.

Mississippi Electric League

President, A. H. JONES, Jones-Johnson Co., McComb, Miss.; *Secretary,* A. R. RIDDICK, A. G. Riddick, Inc., Jackson, Miss.

Oklahoma Utilities Association

President, L. W. SCHERER, United Telephone Corp., Watonga, Okla.; *Secretary,* EDWARD F. MCKAY, 1020 Petroleum Bldg., Oklahoma City, Okla.

Southwestern Public Service Association

President, W. H. BURKE, Stone & Webster, Inc., Houston, Tex.; *Secretary,* E. N. WILLIS, 403 Slaughter Bldg., Dallas, Tex.

*Note: This Division is in Process of Formation.

SECTIONS, BUREAUS AND COMMITTEES

Chairmen's names only listed here

SPECIAL NATIONAL COMMITTEES

Advertising Committee—FRANK LEROY BLANCHARD, Henry L. Doherty & Co., New York, N. Y.

Charles A. Coffin Prize Committee—P. S. ARKWRIGHT, Georgia Power Co., Atlanta, Ga.

Codes and Standards Committee—IRVIN W. DAY, The Connecticut Light & Power Co., Waterbury, Conn.

Constitution and By-Laws Committee—R. F. PACK, Northern States Power Co., Minneapolis, Minn.

Electrification of Steam Railroads Committee—BRITTON I. BUDD, Public Service Co. of Northern Illinois, Chicago, Ill.

Exhibition Committee—E. W. GOLDSCHMIDT, Wagner Electric Corp., New York, N. Y.

Finance Committee—SIDNEY Z. MITCHELL, Electric Bond & Share Co., New York, N. Y.

Lamp Committee—FRANK W. SMITH, The United Electric Light & Power Co., New York, N. Y.

Prize Awards Committee—W. H. ONKEN, JR., *Electrical World,* New York, N. Y.

Public Policy Committee—R. H. BALLARD, Southern California Edison Co., Los Angeles, Cal.

Rate Research Committee—L. R. NASH, Stone & Webster, Inc., Boston, Mass.

Water Power Development Committee—PAUL A. SCHOELLKOPF, The Niagara Falls Power Co., Niagara Falls, N. Y.

Wiring Policy Committee—J. E. DAVIDSON, Nebraska Power Co., Omaha, Neb.

GENERAL NATIONAL COMMITTEES

*Civic Development Committee—JOHN B. REYNOLDS, Middle West Utilities Co., Chicago, Ill.

*Educational Committee—FRED R. JENKINS, Commonwealth Edison Co., Chicago, Ill.

*Insurance Committee—W. H. SAWYER, Allied Power & Light Co., New York, N. Y.

*Membership Committee—HOWARD K. MOHR, The Philadelphia Electric Co., Philadelphia, Pa.

*Rural Electric Service Committee—CHARLES F. STUART, Northern States Power Co., Minneapolis, Minn.

ACCOUNTING NATIONAL SECTION

*Section's Executive Committee—J. F. FORD, The Philadelphia Electric Co., Philadelphia, Pa.

Budget Committee—B. S. RODEY, JR., The United Electric Light & Power Co., New York, N. Y.

*Classification of Accounts Committee—H. C. HASBROUCK, H. C. Hopson & Co., New York, N. Y.

Corporate Finance Committee—O. E. MCCORMICK, Middle West Utilities Co., Chicago, Ill.

*Customers' Records Committee — DOUGLAS BROWN, New York & Queens Electric Light & Power Co., Long Island City, N. Y.

*Fixed Capital Committee—J. A. ROCKWOOD, Portland Electric Power Co., Portland, Ore.

*General Records Committee—K. B. CRUMB, American Gas & Electric Co., New York, N. Y.

*Purchasing and Storeroom Committee—W. G. YOUNG, New York & Queens Electric Light & Power Co., Long Island City, N. Y.

*Statistics Committee—HARRY A. SNOW, The Detroit Edison Co., Detroit, Mich.

COMMERCIAL NATIONAL SECTION

*Section's Executive Committee—MARSHALL E. SAMPSELL, Central Illinois Public Service Co., Chicago, Ill.

*Commercial and Industrial Power and Heating Bureau—V. M. F. TALLMAN, Charles H. Tenney & Co., Boston, Mass.

Commercial Cooking Committee—O. WILHELMY, The Union Gas & Electric Co., Cincinnati, Ohio.

Electric Truck Committee—GUY W. THOMAS, Public Service Co. of Colorado, Denver, Colo.

General Power Committee—H. C. THUERK, Erie Lighting Co., Erie, Pa.

Industrial Heating Committee—J. L. FADEN, The Edison Electric Illuminating Co., Boston, Mass.

*Lighting Bureau—T. O. KENNEDY, The Ohio Public Service Co., Cleveland, Ohio.

Commercial and Industrial Lighting Committee—J. DANIELS, The Edison Electric Illuminating Co., Boston, Mass.

Electrical Advertising Committee—C. J. EATON, Middle West Utilities Co., Chicago, Ill.

Home Lighting Committee—W. T. BLACKWELL, Public Service Electric & Gas Co., Newark, N. J.

Street Lighting Committee—R. J. MALCOMSON, Public Service Co. of Northern Illinois, Chicago, Ill.

*Merchandising Bureau—FRANK D. PEMBLETON, Public Service Electric & Gas Co., Newark, N. J.

Domestic Electric Range Committee—F. A. COUPAL, Buffalo, Niagara & Eastern Power Corp., Buffalo, N. Y.

Merchandise Sales Committee—C. L. HAROLD, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

Refrigeration Committee—C. L. DUNN, The Ohio Public Service Co., Cleveland, Ohio.

Water Heating Committee—NORMAN T. WILCOX, Stone & Webster, Inc., Boston, Mass.

*Customer Relations Committee—H. T. EAST, Public Service Co. of Northern Illinois, Chicago, Ill.

Promotional Rates Committee—E. W. LLOYD, Commonwealth Edison Co., Chicago, Ill.

*Wiring Sales Committee—A. P. GOOD, Commonwealth Edison Co., Chicago, Ill.

ENGINEERING NATIONAL SECTION

*Section's Executive Committee—E. C. STONE, Duquesne Light Co., Pittsburgh, Pa.

*Accident Prevention Committee—C. R. BEARDSLEY, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

*Electrical Apparatus Committee—J. A. JOHNSON, The Niagara Falls Power Co., Niagara Falls, N. Y.

Engineering Administration Committee—H. P. LIVERSIDGE, The Philadelphia Electric Co., Philadelphia, Pa.

*Hydraulic Power Committee—BYRON E. WHITE, Utica Gas & Electric Co., Utica, N. Y.

*Inductive Coordination Committee—H. L. WILLS, Georgia Power Co., Atlanta, Ga.

*Meter Committee—E. E. HILL, The New York Edison Co., New York, N. Y.

*Overhead Systems Committee—HAROLD COLE, The Detroit Edison Co., Detroit, Mich.

*Power System Engineering Committee—L. W. W. MORROW, _Electrical World,_ New York, N. Y.

*Prime Movers Committee—E. B. RICKETTS, The New York Edison Co., New York, N. Y.

Special Engineering Research Committee—C. F. HIRSHFELD, The Detroit Edison Co, Detroit, Mich.

*Underground Systems Committee—J. W. SYLVESTER, The Philadelphia Electric Co., Philadelphia, Pa.

PUBLIC RELATIONS NATIONAL SECTION

***Section's Executive Committee**—J. F. OWENS, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

***Cooperation with Educational Institutions**—CARL D. JACKSON, 36 West 44th Street, New York, N. Y.

***Customer Ownership**—W. H. HODGE, Byllesby Engineering & Management Corp., Chicago, Ill.

***Industrial Relations Committee**—HOMER E. NIESZ, Commonwealth Edison Co., Chicago, Ill.

***Information Bureau Organizations Committee**—T. A. KENNEY, Allied Power & Light Corp., New York, N. Y.

Manufacturers' Advertising Committee—T. J. McMANIS, General Electric Co., Schenectady, N. Y.

***Public Speaking Committee**—W. S. VIVIAN, Middle West Utilities Co., Chicago, Ill.

***Relations with Financial Institutions Committee**—A. W. ROBERTSON, Westinghouse Electric & Manufacturing Co., New York, N. Y.

***Women's Committee**—MISS SOPHIA MALICKI, Middle West Utilities Co., Chicago, Ill.

***Provision is made for a representative from each Geographic Division.**

CONVENTIONS AND MEETINGS

Meeting of the Section, Bureaus and Committees of the National Electric Light Association are shown in roman type; those of other associations in italics

1929

March

4–5 Cooperation with Educational Institutions Committee, 11:00 a. m., N.E.L.A. Headquarters, New York, N. Y.

4–6 *American Railway Association, Division 4, Engineering Signal Section, Stevens Hotel, Chicago, Ill.*

5 Public Speaking Committee, 10:30 a. m., N.E.L.A. Headquarters, New York, N. Y.

5 Women's Committee, 10:00 a. m., Room 600, 420 Lexington Avenue, New York, N. Y.

5 Insurance Committee, N. E. L. A. Headquarters, 10:00 a. m., New York, N. Y.

6 Executive Committee, Public Relations National Section, 10:30 a. m., N. E. L. A. Headquarters, New York, N. Y.

6 *New York Electrical Society, New York, N. Y.*

6 Rural Electric Service Committee, 10:30 a. m., Room 600, 420 Lexington Avenue, New York, N. Y.

7 National Executive Committee, 10:30 a. m., N. E. L. A. Headquarters, New York, N. Y.

8 *Board of Directors, Society for Electrical Development, New York, N. Y.*

11–12 Hydraulic Power Committee, Peabody Hotel, Memphis, Tenn.

11–12 Overhead Systems Committee, Peabody Hotel, Memphis, Tenn.

11–12 Power Systems Engineering Committee. Peabody Hotel, Memphis, Tenn.

11–12 Prime Movers Committee, Peabody Hotel, Memphis, Tenn.

12 Executive Commitee, Engineering National Section, Peabody Hotel, Memphis, Tenn.

12–13 Accident Prevention Committee, Peabody Hotel, Memphis, Tenn.

12–14 Oklahoma Utilities Association, Oklahoma City, Okla.

13–14 Electrical Apparatus Committee, Peabody Hotel, Memphis, Tenn.

13–14 Inductive Coordination Committee, Peabody Hotel, Memphis, Tenn.

13–14 Meter Committee, Peabody Hotel, Memphis, Tenn.

13–14—Underground Systems Committee, Peabody Hotel, Memphis, Tenn.

17–23 *Oklahoma A. & M. College Short Course, Stillwater, Okla.*

19–20 Merchandising Conference, Great Lakes Geographic Division, Edgewater Beach Hotel, Chicago, Ill.

20 Commercial and Industrial Lighting Committee, 9:30 a. m., Edgewater Beach Hotel, Chicago, Ill.

20 Electrical Advertising Committee, 10:30 a. m., Edgewater Beach Hotel, Chicago, Ill.

20 Street Lighting Committee, 9:30 a. m., Edgewater Beach Hotel, Chicago, Ill.

20 Water Heating Committee, 9:30 a. m., Edgewater Beach Hotel, Chicago, Ill.

20 Electric Truck Committee, 9.30 a. m., Edgewater Beach Hotel, Chicago. Ill.

20 General Power Committee, 9.30 a. m., Edgewater Beach Hotel, Chicago, Ill.

20 Customer Relations Committee, 9:30 a. m., Edgewater Beach Hotel, Chicago, Ill.

20–22 *American Institute of Electrical Engineers, Regional Meeting, Cincinnati, Ohio.*

21 Home Lighting Committee, 9:30 a. m., Edgewater Beach Hotel, Chicago, Ill.

21 Domestic Electric Range Committee, 9:30 a. m., Edgewater Beach Hotel, Chicago, Ill.

21 Merchandising Sales Committee, 9:30 a. m., Edgewater Beach Hotel, Chicago, Ill.

21 Refrigeration Committee, 9:30 a. m., Edgewater Beach Hotel, Chicago, Ill.

21 Commercial Cooking Committee, 9:30 a. m., Edgewater Beach Hotel, Chicago, Ill.

21 Industrial Heating Committee, 9:30 a. m., Edgewater Beach Hotel, Chicago, Ill.

21 Promotional Rates Committee, 9:30 a. m., Edgewater Beach Hotel, Chicago, Ill.

21 Wiring Sales Committee, 9:30 a. m.. Edgewater Beach Hotel, Chicago, Ill.

21–23 *American Society of Mechanical Engineers, Knoxville, Tenn.*

22 Executive Committee, Commercial National Section, 10:00 a. m., Edgewater Beach Hotel, Chicago, Ill.

25–30 *Purdue University Short Course, Lafayette, Ind.*

April

1–2 Industrial Heating Conference, Great Lakes Power Club, University of Michigan, Ann Arbor, Mich.

3 *New York Electrical Society, New York, N. Y.*

5 Commercial Section, Great Lakes Geographic Division, Detroit, Mich.

12 Maryland Utilities Association, Emerson Hotel, Baltimore, Md.

4–13 *Home Complete Exposition, Indiana State Fair Grounds, Indianapolis, Ind.*

17–18 *National Warm Air Heating and Ventilating Association, Indianapolis, Ind.*

18–20 Engineering Section, Great Lakes Geographic Division, Drake Hotel, Chicago, Ill.

18–20 Arizona Utilities Association, Tucson, Ariz.

21–23 *American Society of Civil Engineers, Dallas, Texas.*

22–26 *American Welding Society, Engineering Societies Bldg., New York, N. Y.*

24–26 Middle West Geographic Division, Hotel Fontenelle, Omaha, Neb.

29–30 *Chamber of Commerce of the U. S. A., Washington, D. C.*

30 Southwestern Geographic Division, Hot Springs, Ark.

30 Arkansas Utilities Association, Hot Springs, Ark.

May

1–3—Southwestern Geographic Division, Hot Springs, Ark.

1–3 Arkansas Utilities Association, Hot Springs, Ark.

1–3 *Chamber of Commerce of the U. S. A., Washington, D. C.*

1–3 *Indiana Public Utilities Association. Hotel Gary, Gary, Ind.*

1–3 Indiana Electric Light Association, Hotel Gary, Gary, Ind.

1–3 *Indiana Gas Association, Hotel Gary, Gary, Ind.*

7–9 *American Institute of Electrical Engineers, Regional Meeting, Dallas, Texas.*

7–10 East Central Geographic Division. Brown Hotel, Louisville, Ky.

8–10 Southeastern Geographic Division, Asheville, N. C.

13–15 *American Society of Mechanical Engineers, Rochester, N. Y.*

13–16 *National Fire Protection Association. Memphis, Tenn.*

13–16 *National Fire Protection Association, Memphis, Tenn.*

13–24 Industrial Heating School, Case School of Applied Science, Cleveland, Ohio.

20–25 National Electrical Manufacturers Association, The Homestead, Hot Springs, Va.

27–31 *National Electrical Wholesalers Association, The Homestead, Hot Springs, Va.*

27–31 *General Federation of Women's Clubs. Swampscott, Mass.*

31 Commercial Section, Great Lakes Geographic Division, Indianapolis, Ind.

June

3–7 Annual Convention and Exhibition, NATIONAL ELECTRIC LIGHT ASSOCIATION, Municipal Auditorium, Atlantic City, N. J.

10–15 *Westinghouse Agent-Jobber's Association, The Homestead, Hot Springs, Va.*

14 *Board of Directors, Society for Electrical Development, New York. N. Y.*

16–18 North Central Geographic Division, Breezy Point Summer Resort. Pequot, Minn.

18–21 *Society of Automotive Engineers. New York, N. Y.*

19–21 Canadian Geographic Division, Algonquin Hotel, St. Andrews-by-the-Sea, N. B.

19–22 Pacific Coast Geographic Division. Del Monte, Cal.

20–21 Accounting Section, Wisconsin Utilities Association, Sheboygan, Wis.

24–28 *American Society for Testing Material, Atlantic City, N. J.*

24–28 *American Institute of Electrical Engineers, Swampscott, Mass.*

26–29 Northwest Geographic Division, Seattle, Wash.

July

1–1 *American Society of Mechanical Engineers, Salt Lake City, Utah*

1–5 *American Home Economics Association Convention and Exhibition. Statler Hotel, Boston, Mass.*

18–19 Electric Section, Wisconsin Utilities Association, Hotel Wausau, Wausau, Wis.

August

27–30 *National Association of Railroad and Utilities Commissioners, Glacier National Park Hotel, Glacier National Park, Mont.*

September

4–6 Pennsylvania Electric Association. Bedford Springs Hotel, Bedford Springs, Pa.

9–11 Rocky Mountain Geographic Division Hotel Colorado, Glenwood Springs. Colo.

9–12 New England Geographic Division, Hotel Griswold, New London, Conn.

9–13 *American Society for Steel Treating, Cleveland, Ohio.*

19–20 Empire State Gas and Electric Association, Saranac Inn, Saranac Lake, N. Y.

28–30 *American Electric Railway Association Convention and Exhibit, Atlantic City Auditorium, Atlantic City, N. J.*

30 *National Safety Council, Stevens Hotel, Chicago, Ill.*

October

1–4 *American Electric Railway Association Convention and Exhibit, Atlantic City Auditorium, Atlantic City, N. J.*

1–4 *National Safety Council, Stevens Hotel, Chicago, Ill.*

14–18 *American Gas Association, Atlantic City, N. J.*

New Members

Electric Light and Power Companies (Class A)

Arkansas, Fort Smith, Mississippi Valley Power Company

Connecticut, Unionville, The Union Electric Light & Power Company

Canada, Alberta, Calgary, Canadian Utilities, Limited

Canada, N. S., Yarmouth, Western Nova Scotia Electric Company, Limited

Canada, Quebec, Montreal, South Shore Light, Heat & Power Corp.

Employees of Electric Light and Power Companies (Class B)

Alabama, Birmingham, Alabama Power Company
Charles W. Kenyon (Anniston, Ala.)
Oscar R. Ringwall (Southeastern Power & Light Company, 120 Broadway, New York, N. Y.)

California, San Francisco, Coast Counties Gas & Electric Company
B. M. Rice (Gilroy, Calif.)
Joseph B. Wilson (Santa Cruz, Calif.)

California, San Francisco, Pacific Gas & Electric Company
Arthur H. Anderson
Frank Anson (Stockton, Calif.)
F. E. Cook, Jr.
F. S. Curren
A. C. Eddy (Stockton, Calif.)
E. M. Fraley
C. Gentis (Oakland, Calif.)
E. W. Hodges
Roscoe Jensen
E. C. Johnson (Oakland, Calif.)
C. A. Jordan
A. S. Kipsey (Angels Camp, Calif.)
F. P. Lallement (Sacramento, Calif.)
Walter F. Noggle (Red Bluff, Calif.)
Ray L. Trabucco (Sonora, Calif.)
Alex Walls
C. A. Wilcox

Connecticut, Hartford, The Hartford Electric Light Company
Major A. G. Pendleton
E. H. Tyrol

Connecticut, New London, The Connecticut Power Company
E. L. Roberts (Canaan, Conn.)

Connecticut, Thompsonville, The Northern Connecticut Power Company
Edward Gardner

Connecticut, Unionville, The Union Electric Light & Power Company
Daniel C. Payne
Carl W. Turner

Connecticut, Waterbury, Connecticut Light & Power Company
Miss Marjorie Ann Buckley (Norwalk, Conn.)
Miss Myrtle K. Scholz (New Britain, Conn.)

Connecticut, Willimantic, The Rockville-Willimantic Lighting Company
G. L. Black
R. H. Gibson
P. L. Moran
C. H. Reinhardt

Florida, Miami, Florida Power & Light Company
J. F. Wilkinson (Titusville, Fla.)

Florida, St. Petersburg, Florida Power Corporation
Walter C. Schoeppe

Florida, Tampa, Tampa Electric Company
Malcolm R. McKinley
Miss Agnes Manke

Georgia, Albany, South Georgia Power Company
R. C. Furst (Columbus, Ga.)

Georgia, Atlanta, Georgia Power Company
F. B. Culley (Augusta, Ga.)

Georgia, Columbus, Columbus Electric and Power Company
B. F. Billings, Jr.
Miss Madeline Blissett
Miss Mattie Ree Combs
Miss Sarah Fulford
Flora Jenkins
Miss Myra Koehne
Miss Mary McElroy
Mrs. LaMottee McEwen
Miss Effie Maddux
Mrs. L. G. Moyer
Mrs. Jessie Richards
Miss Louise Turner

Georgia, Savannah, Savannah Electric & Power Company
Henry V. Faber

Idaho, Boise, Idaho Power Company
Stanley M. Brown (Payette, Idaho)
A. E. Carlos
Chas. Elliott (Twin Falls, Idaho)
Paul J. Gilman (Twin Falls, Idaho)
H. L. Holmes (Twin Falls, Idaho)
Albert L. Leick
M. W. Lunstrum (Payette, Idaho)
R. W. Mangun (Nampa, Idaho)
M. A. Newman (Twin Falls, Idaho)
Wm. H. Putnam (Twin Falls, Idaho)
Nathan L. Scott
Merritt Shotwell (Twin Falls, Idaho)
W. E. Wayne

Electric Heat

(Continued from page 152)

apply it just where it is needed. Heating units can be made in any shape or size, ranging from the small one which keeps the soldering iron at the proper temperature by the consumption of about 100 watts to the large units used in industrial furnaces and consuming anywhere from 5000 to 500,000 watts.

The factor of cleanliness and improvement in other working conditions is one of those advantages which often results unexpectedly from an installation of electric heat chosen for some other more material reason. The influence on the morale of the workmen is found to be decidedly beneficial where this form of heat is employed. The shop is no longer filled with gaseous fumes; the absence of noise which attends combustion is decidedly noticeable, and the operator finds the control so simplified that his work is, in turn, simplified and made more pleasant.

Electric heat is not, and never was, a panacea, to be used wherever heat is needed. There are, and probably always will be, applications where fuel-generated heat must be used. Considered as a tool, electric heat has a definite and valuable place in industry today. Its possibilities are only just beginning to be realized.

June 3rd-7th Inclusive

52nd N. E. L. A. Convention

Exhibition Opens May 31

Guide to This Issue

The Convention and Exhibition, 197

Reservations are pouring into the Atlantic City hotels in unprecedented numbers, indicating that the fifty-second convention will surpass all others in attendance as well as in diversity and magnitude of program. General information on sessions, transportation, hotels, etc.

Exhibition Will Provide Fine Show of Electrical Apparatus, 201

The exhibition will be 20 per cent larger than the exhibition last year. Because of better facilities it will be more accessible and more attractively arranged. A list of exhibitors is appended to this article.

Light's Golden Jubilee to Be Inaugurated at N.E.L.A. Convention, 203

All branches of the industry will promote nationally and locally the celebration of the fiftieth anniversary of the invention of the incandescent lamp by Thomas A. Edison.

Light's Golden Jubilee Essay Contest, 204

Details of prize awards offered to employees of member companies of the National Electric Light Association.

Entertainment Features of the 1929 Convention, 205

Miss Frieda Hempel, Albert Spalding and B. A. Rolfe's Orchestra will provide musical entertainment at the convention. The President's Ball, golfing at Seaview, dances every night and special diversions for the ladies will add to the gaiety of the convention.

National Executive Committee Meeting, 206

Reports from geographic divisions, the four national sections and special and general committees of the executive committee meeting held March 7 at New York indicated satisfactory progress in association activities.

Behind the Veil: The Tears of the Heliades, 209

Ernest Greenwood

The first of a series of articles under the general title of "Behind the Veil," which will portray against a social-historic background the evolution of the electrical industry and the chief personalities that have been instrumental in its growth.

Street Lighting: A Much Neglected Source of Revenue, 213

W. T. Blackwell

The remarks in this article may be considered applicable to the street lighting problems of any electric service company, and particularly so to the problems of the company supplying a number of cities and towns and having the usual relations with municipal, county and state government.

Amplifier Considers Rate Reduction, 219

Amplifier

The author considers the effect of rate reduction on public relations and load building. Most of the companies, he concludes, have been farsighted and courageous enough to take the necessary steps to bring about a steady reduction in rates.

Lineman? Lineman? 221

J. R. Patterson

A moving story of the spirit that enables the lineman to carry on in spite of seemingly overwhelming obstacles.

Employee and Consumer, 222

This article tells of a plan carried out by Pacific Coast companies last year which did much to gain the interest of their employees, induced them to study the problem of public relations and incidentally brought them to realize their importance in their respective organizations.

The Reviewing Stand, 251

THE PRESIDENT'S PAGE

Convention

THE Convention—June 3 to 7—is barely two months away.

It is not just another convention.

This one never has been held before—never will be held again.

It christens the new auditorium constructed by the municipality of Atlantic City at a cost of fifteen million dollars—comfortable, commodious, convenient convention halls built according to modern plans and with the latest equipment.

There will be a new setting, a fresh outlook—on a new part of the boardwalk, opposite a new segment of the ocean.

The exhibit last year was the largest up to that time. This year the exhibit is twenty per cent larger. Because of the better facilities, it will be more accessible and more attractive than heretofore, and will present devices and improvements developed since last year.

The educational value of the exhibition alone will more than justify the time and cost of attendance.

The program of the meetings has been arranged to present the most important of the subjects engaging the immediate attention of the industry—such as regulation, rate making, research, railroad electrification, rural electrification, industrial development, engineering advance, operating methods, commercial opportunities, load building, accounting, practices, public relations and sound policies.

Some of the speakers and authors from whom acceptances have been received include Walter S. Gifford, Julius H. Barnes, W. A. Ransom, A. W. Robertson, J. R. Howard, W. J. Hagenah, Matthew S. Sloan, John W. Lieb, Charles L. Edgar, J. F. Owens, Marshall E. Sampsell, E. C. Stone, J. F. Ford, Britton I. Budd and W. H. Onken, Jr. Others of similar standing have been invited.

A special feature of each general session will be a talking motion picture bringing the form, the voice and a message of speakers of international fame. The films are now in process of being made especially for this meeting with scenario and address appropriate for this particular convention. They will be impressive and entertaining and will arouse interest and attention.

The program of Thursday's session is built around the 50th anniversary of the invention of the electric incandescent lamp.

In addition, special lighting will be arranged in the convention hall and along the boardwalk throughout the week as a part of the Golden Anniversary Jubilee of the Incandescent Lamp.

The address on public policy night will be made by a gentleman of national importance. The musical artists of the evening will be Madame Frieda Hempel and Mr. Albert Spalding.

The general business sessions will be confined to the mornings while the afternoons will be devoted to the Four National Sections, thereby avoiding overlapping of meetings and at the same time give emphasis to the work and accomplishments of each section.

All the sessions will be instructive, inspirational and entertaining. They will convene on time, move rapidly and adjourn shortly.

This has been a year of advancement and accomplishment in the industry. The convention gives opportunity to learn of the accomplishments of the past, to perfect plans for the future and to generate enthusiasm and gain inspiration for the work ahead.

If you miss this convention, you'll regret it. There'll be other conventions—but not this one ever again.

No other golden anniversary of the electric lamp—no other christening of a marvelously modern convention hall by your association—no resultant electric exhibition or business program to fit a momentous occasion—will occur again in your lifetime.

We each need now more than ever the support, help, experience, counsel, enthusiasm and fellowship of the other.

A refreshing companionship, a rejuvenating recreation, an increased knowledge and a greater appreciation of your life's work await you at the convention and exhibition of your Association at Atlantic City in June.

PSArkwright

President.

N·E·L·A· BULLETIN

Entered as Second Class Matter Jan. 28, 1914, at the Post Office, New York, N. Y., under the Act of March 3, 1879.

Published monthly at 420 Lexington Ave., New York, N. Y., by the

NATIONAL ELECTRIC LIGHT ASSOCIATION

A Voluntary Organization of Companies Engaged In, and Individuals Affiliated With, or Interested In, the Electric Light and Power Industry: "Organized to Advance the Art and Science of the Production, Distribution and Use of Electrical Energy for Light, Heat and Power for Public Service."

P. S. ARKWRIGHT, *President*
PAUL S. CLAPP, *Managing Director*
GEORGE F. OXLEY, *Director, Dept. of Public Information*
A. JACKSON MARSHALL, *Secretary*

WILGAR COLEMAN, *Editor*
Contributing Editors
S. J. BALLINGER

THORNE BROWNE
JOHN W. LAPHAM
HAROLD A. BUCH
H. M. LYSTER
O. A. BURSIEL
BERKELEY SNOW
D. L. GASKILL
SAMUEL H. TAYLOR
O. A. WELLER

Subscription price of the N. E. L. A. BULLETIN, in United States, is $3.00 per year to members and non-members. Half price to colleges and libraries. Single copies, 25 cents. Foreign subscriptions, $4.00 per year to non-members.

Orders should be made direct to the National Electric Light Association, 420 Lexington Ave., New York, N. Y.

The closing date for the N. E. L. A. BULLETIN is the fifteenth of the month preceding the month of issue. Material intended for publication must be in the hands of the editor by that date to insure publication the following month.

Manuscripts and correspondence relating to the N. E. L. A. BULLETIN should be addressed to the Editor, N. E. L. A. BULLETIN, 420 Lexington Ave., New York, N. Y.

The National Electric Light Association does not assume responsibility for nor necessarily endorse, or approve, statements made by individual contributors.

Code address of the National Electric Light Association is "Nelap," Bentley's code.

For the convenience of members arriving in New York after office hours or on legal holidays, the following telephone numbers connect with N.E.L.A. headquarters office:

Lexington	3300 3301 3302	Paul S. Clapp A. Jackson Marshall
Lexington	8592	George F. Oxley
Lexington	3310	Fred W. Herbert
Lexington	5059	C. E. Greenwood
Lexington	3311	E. H. Greenwood
Lexington	5035	J. O'R. Coleman and Engineering Department
Lexington	3312	Editorial Department

If the priests of the Mediaeval Age were justly canonized as Saints, Galileo, Watt, Stephenson, Morse, Bell Edison and Ford certainly deserve to be honored as gods and enshrined with Prometheus and Cadmus. They represent that which is most divine in man, namely, that creative intelligence which provides implements and makes civilization possible.—*Hu Shih.*

Preferred Voltages

THERE is general agreement on the need for standardization of system voltages and of the voltage ratings of the equipment used on these systems. There is no reason why systems should be developed for voltages not more than a few per cent apart, that can be justified on economic or engineering grounds except those of expediency. The advantages of having such systems of the same voltage are obvious, especially where they are adjacent to each other. The idea of voltage standardization appears as early as in the A. I. E. E. standardization rules of 1899, but it is only recently that those concerned have made an effective effort to coordinate all of the various considerations that must enter into a workable scheme for standard or preferred voltage ratings.

The Joint Committee of the N. E. L. A. and the N. E. M. A., which has recently reported on Preferred Voltage Ratings for A-C Systems, is to be congratulated on the successful conclusion of their assignment. The report of this Committee is to be commended not only for the preferred voltages which it establishes, but also for the successful way in which all of the factors entering the problem have been coordinated in a comprehensive scheme. The indications are that the preferred voltages recommended in this report will result in a substantial simplification of the ratings of electrical systems, with their associated apparatus.

Mass Production

THE fundamental principle of American industrial expansion is mass production — consolidation into large operating units with production concentrate in efficient and large plants. This is strikingly illustrated by U. S. Census figures on power production, summarized herein. These figures are tangible evidence of the results of consolidation and unification which have taken place during the past decade, most of which has been made possible by the financial resources of the holding companies.

At the end of 1922, the systems serving the United States comprised 3774 commercial enterprises and 2581 municipal plants, making a total of 6355. Five years later, at the end of 1927, the number of commercial enterprises had decreased to 2135—a disappearance of 1639, or of 44 per cent—while the number of municipal plants had decreased to 2192—a disappearance of 389, or of 15 per cent. A grand total of 2028 enterprises have thus been consolidated and unified during this five-year period —a process explained by the United States Bureau of the Census as being "due to the centralization of ownership or control and the absorption of independent generating stations accompanying the extension of transmission lines" in the case of commercial systems, and "to the abandonment of municipal generating stations and the acquisition of municipal distribution lines by commercial systems" in the case of municipal plants.

A similar, striking decrease is shown in the number of power houses during this five-year period, although the total installed capacity of the generating equipment has shown a very large growth. At the end of 1922, there were 5444 power plants devoted to the service of electricity supply and their total capacity was 14,313,438 kilowatts. At the end of 1927, the number of power plants had decreased to 4387—a loss of 1057, or of 19 per cent. At the same time, their total capacity stood at 25,802,530 kilowatts, an increase of 80 per cent. The replacement of the smaller and isolated power houses by coordinated systems of greater size and more efficient operation is graphically illustrated by taking the average size of the power houses in these two years.

In 1922, the average generating plant in the United States had an installed capacity of 2628 kilowatts; in 1927, this figure had grown to 5880 kilowatts. In other words, although the number of power houses has declined by one-fifth, their average size has more than doubled during the past five years.

Indexes

WE have a communication from John Cotton Dana, Librarian of the Public Library of Newark, N. J., which reads in part:

"The N. E. L. A. BULLETIN is fully indexed—every issue, as soon as published—in a set of cards, which brings ready to hand any article on any subject in the BULLETIN, or in any one of 1700 other journals in all languages. This Engineering Index Service, instituted in January, 1928, is to be found in the public libraries of Newark, Cleveland, Bridgeport, Baltimore and the John Crerar Library, Chicago.

While on the subject, it may be worth pointing out that articles in the BULLETIN are also currently indexed in each issue of the *Journal of Land and Public Utility Economics*, the *Industrial Arts Index*, published by the H. W. Wilson Company, *The Engineering Index*, published by the American Society of Mechanical Engineers, and in the *American Economic Review*, published by the American Economic Association.

The Convention and Exhibition

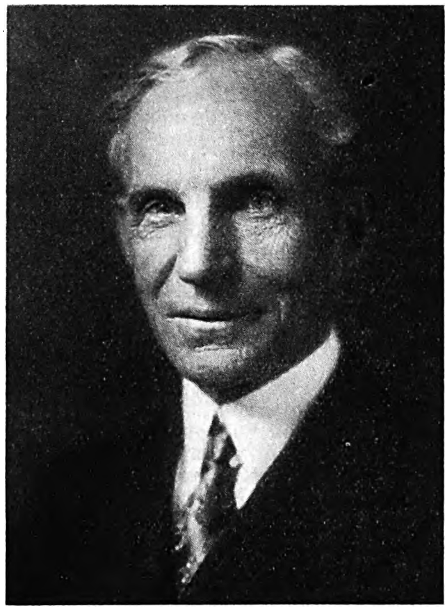
A refreshing companionship, a rejuvenating recreation, an increased knowledge and a greater appreciation of your life's work await you at the Convention and Exhibition of your Association at Atlantic City in June

WITH the Convention and Exhibition hardly more than a month away, reservations are pouring into the Atlantic City hotels in unprecedented numbers, indicating that the 52nd Convention will surpass all others in attendance as well as in diversity and magnitude of program. Approximately ten thousand registrants has been the maximum number for any previous convention. The superior program for this year and the many unusual features are expected to attract a much greater attendance.

PRESIDENT ARKWRIGHT, the Convention and Exhibition Committees and Headquarters Staff are making every effort to prepare the stage for a demonstration of economic and social progress worthy of the industry.

The most important subjects engaging the attention of the electrical industry, including regulation, research, rate making, industrial development, engineering advance, rural electrification, operating methods, railroad electrification, commercial opportunities, load building, accounting practices, public relations and sound policies, will be discussed by leading men of the industry, and a number of speakers of international reputation in other fields of business and cultural activities will also be present.

Some of those who have already accepted places on the program are: Julius H. Barnes, Walter S. Gifford, Matthew S. Sloan, John W. Lieb, Marshall E. Sampsell, Britton I. Budd, W. A. Ransom, A. W. Robertson, J. R. Howard, W. J. Hagenah, Charles E. Edgar, J. F. Owens, E. C. Stone, J. F. Ford and W. H. Onken, Jr.



HENRY FORD
who will appear at the 52nd Convention of the Association

Among the many prominent men of affairs who will attend the Convention is Henry Ford whose friendship with Mr. Edison has inspired his keen interest in the collecting of early types of electrical apparatus which will form a part of the Ford Museum of Americana at Dearborn, Mich.

Among the features of the Convention will be talking motion pictures at each session presenting messages from dignitaries of international fame, another motion talking picture entitled "The Romance of Power," filmed especially for the Convention; spectacular displays and uses of electrical wonders among the exhibits, a great Festival of Light contributed by Atlantic City, the dedication of the new $15,000,000 Atlantic City Convention Hall, and the inauguration of Light's Golden Jubilee.

There will be over two hundred interesting and instructive exhibits shown in the huge auditorium of the Atlantic City Convention Hall—the exhibits will be presented in a magnificant setting. The new Convention Hall will be dedicated and the exhibits opened Friday, May 31.

GENERAL SESSIONS will be held on the morning of Tuesday, June 4, Wednesday, June 5, Thursday, June 6, and Friday, June 7. These sessions will convene promptly at 10 a. m. Section Sessions will be held in the afternoons, beginning at 3 o'clock. Accounting and Engineering Sessions will be held in parallel Tuesday; Commercial Session, Wednesday afternoon; Public Relations Session, Thursday afternoon. Please note that the Commercial Session will be held on Wednesday afternoon and the Engineering

Session on Tuesday instead of vice versa as previously announced. The Public Policy Session will be held Thursday evening instead of Wednesday evening as at previous conventions.

The entertainment features at the Convention will be of the highest order, an outline of what is planned appearing elsewhere in this issue.

Many thousands of persons will attend the formal dedication of the Municipal Auditorium on Friday, May 31, which is the day following Memorial Day, and thousands will spend the week-end at Atlantic City. If hotel accommodations are desired prior to Monday, June 3, immediate application should be made.

Heavy railroad movement to Atlantic City suggests early action to secure reservations. The Transportation Circular sent to all members tells about train schedules, rates, etc. Don't overlook the Identification Certificate which must be used to obtain reduced convention rates.

The Transportation Committee has arrangements with the several Passenger Associations in the United States to allow all delegates, including dependent members of their families, a reduced railroad fare of a fare-and-a-half for the round trip on the Identification Certificate Plan from all points in the United States.

AN additional concession which will appeal to many delegates has also been obtained. If you wish to remain in the East for a period in excess of the return limit granted on the certificate and will indicate to your agent when purchasing your ticket, you may, by paying a fare and three-fifths, obtain a ticket with return limit thirty days from date of sale. Be sure to specify when you purchase your ticket, fare and one-half, fare and three-fifths, or Summer Tourist. Any of these types of tickets may be obtained.

It is the desire of the Transportation Committee to be of effective assistance in every possible way to delegates attending the Convention. The personnel of the Transportation Committee appears on page 200. It is the wish of this committee to assist you in securing the accommodations you desire and to help in arranging for special Pullman cars to include accommodations for those delegates who may come from remote points and who desire to travel to the Convention together. The nearest assistant traffic manager will gladly assist you in this connection.

Each member of the Association should have received the latter part of March circulars giving complete information on hotels and transportation facilities, and also reservation blanks. If these were not received or have been misplaced, please notify the Secretary of the Association, 420 Lexington Avenue, New York, N. Y.

In the hotel circular is reproduced a list of Atlantic City hotels, giving information as to the character of accommodations offered, the range of prices and location of hotels. To secure accommodations, members and guests should use the blank which accompanied circular indicating first, second and third choice of hotels, detach and mail directly to hotel of first choice. If such hotel cannot furnish the desired accommodations, it will immediately forward the application to the Hotel Committee, which will endeavor to make reservation at hotel of second and third choice. All hotels have been instructed to acknowledge all reservations directly to the persons applying for them.

It is imperative that definite date of arrival, hour of arrival and date of departure be given on application. This information will enable the com-

CONVENTION AND EXHIBITION CALENDAR

Friday, May 31st:

Exhibition will be opened at 6:00 P.M. for inspection by delegates and general public from the balcony of the Municipal Auditorium.
(Note: Visitors will not be admitted to the exhibition floor on Friday evening.)
Municipal Auditorium Dedication. Program to be announced later.

Saturday, June 1st:

Registration will open at 10:00 A.M.
Exhibition will open at 12 noon to delegates and general public, remaining open that afternoon and evening.

Sunday, June 2nd:

Registration will open at 2:30 P.M.
Exhibition will open at 12 noon to delegates and general public, remaining open that afternoon and evening.

Monday, June 3rd:

Registration will open at 8:30 A.M.
Exhibition will open at 9:00 A.M. to delegates and guests only, remaining open that morning and afternoon.
The President's Reception at 9:00 P.M. to be followed by dancing.

Tuesday, June 4th:

Registration will open at 9:00 A.M.
Exhibition will open at 9:00 A.M. to delegates and guests only, remaining open that morning and afternoon.
First General Session at 10:00 A.M.
Accounting National Section Session at 3:00 P.M.—Chelsea Hotel.
Engineering National Section Session at 3:00 P.M.
Seaview Day entertainment for the ladies.
Dancing in the evening.

Wednesday, June 5th:

Registration will open at 9:00 A.M.
Exhibition will open at 9:00 A.M. to delegates and guests only, remaining open that morning and afternoon.
Second General Session at 10:00 A.M.
Commercial National Section Session at 3:00 P.M.
Card Game for ladies in afternoon.
Entertainment and Dancing in evening.

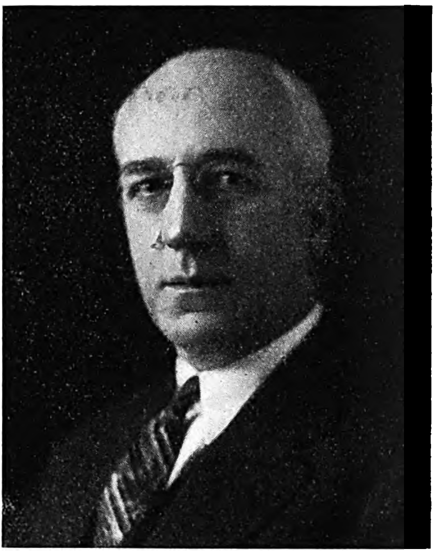
Thursday, June 6th:

Registration will open at 9:00 A.M.
Exhibition will open at 9:00 A.M. to delegates and guests only, remaining open that morning and afternoon.
Third General Session at 10:00 A.M.
Public Relations National Section Session at 3:00 P.M.
Public Policy Committee Session at 9:00 P.M. Dancing at conclusion of this Session.

Friday, June 7th:

Registration will open at 9:00 A.M.
Exhibition will open at 9:00 A.M. to delegates and guests only, remaining open until 1:00 P.M.
Fourth General Session at 10:00 A.M.
Convention adjournment about 1:30 P.M.

THOMAS W. MARTIN
Honorary Chairman, Convention General Committee



P. S. ARKWRIGHT
Chairman, Convention General Committee

mittee to arrange accommodations for other members and guests accordingly.

Hotels cannot be expected to hold reservations made by members and guests who fail to register before 6 p.m. on the day for which they have been reserved unless the time of arrival is clearly indicated and rooms paid for in event that they are not used.

It is important that hotel applications be made promptly. The Hotel Committee, whose personnel is listed on page 200, will be pleased to render any service possible.

As President Arkwright says elsewhere in this issue, "A refreshing companionship, a rejuvenating recreation, an increased knowledge and a greater appreciation of your life's work await you at the Convention."

Lighting the Convention Hall

ATLANTIC CITY'S new convention hall, which is to be formally opened for the N. E. L. A. Convention and Exhibition, is the largest in the world and will be supplied with the most modern and effective lighting equipment obtainable. Novel equipment designed especially for this huge auditorium will give unusual color lighting effects as well as high intensity and easy control.

The Auditorium, in which 40,000 persons can be seated, measures approximately 300 to 480 feet, over which extend eight trusses and the half sides of two others, all of these supporting the roof and being 135 feet above the floor at highest point. Inside of these trusses, which are twelve feet wide, are placed 1500-watt floodlighting projectors spaced about 14 feet apart. They project light to the ceiling, which is finished in celotex and aluminum paint.

Thirty color screens are geared to small motors so that one-half these screens are operated on each side. To obtain any color desired a button is pushed on the stage and the screens stop with a two-foot opening in front of the projectors. About 540 projectors are used. Openings in front of them are also equipped with prismatic diffusing plates. A pilot light system and dimmer control method is incorporated to operate all equipment from the stage.

W. D. Power, British Columbia Electric Railway Co., Ltd., Vancouver, Can.

Exhibition Will Provide Fine Show of Electrical Apparatus

MORE than two hundred manufacturing companies will provide at the Exhibition, which will open on May 31, three days in advance of the Convention, an unparalelled display of the most recent advances in the manufacture of electrical apparatus and equipment of all kinds. The exhibit will be 20 per cent larger than that of last year, and because of better facilities it will be more accessible and more attractively arranged. The great size of the Auditorium of Atlantic City Convention Hall will permit of a more homogeneous arrangement of the displays, and do away with the confusion incidental to exhibits displayed under less favorable conditions. It will be possible to view the whole exhibit from the balcony above the Auditorium.

A carefully prepared descriptive catalog of the exhibits with diagrams showing the exact location of each, will be given to those attending the Convention, thus further obviating any chance of confusion.

Although the Convention itself will not be formally opened until Monday, June 3, the Exhibition will open on Friday, May 31, at 6 p. m. This is to give the general public as well as architects, builders and others directly interested in electrical equipment, an opportunity to view a collection of electrical apparatus such as has never before been collected under one roof. This Exhibition in this way will provide an educational opportunity of great importance.

To indicate the diversity of the exhibit, a few of the articles and displays to be on view are chosen at random:

Power plant equipment.
Turbines.
Generators.
Hydro-electric apparatus.
Aviation field lighting equipment.
Remote control equipment.
Pole line equipment.
Metals.
Domestic lighting.
Commercial lighting.
Street lighting.
Flood lighting.
Domestic appliances of all descriptions.
Electric ranges.
Electric refrigerators.
Water and house heating equipment.
Radio sets and equipment.
First-aid kits and supplies.
Cable and wire.
Electric signs.
Accounting machinery.
Valves, pipes and fittings.
Batteries.
Safety appliances.
Pulverized coal equipment.
Steam generating equipment.
Underground conduit and construction.
Incubators and brooders.
Medical apparatus.
Rural electrification displays.
Motors.
Switches.
Fire protection equipment.
Transmission towers.
Maintenance tools.
Elevator equipment.

While this list is by no means complete, it will at least indicate the wide range of the exhibits. In the following columns a list of exhibitors, corrected to time of going to press, is shown.

LIST OF EXHIBITORS AT 1929 EXHIBITION

(Corrected to date of going to press)

NAME	ADDRESS
Air Preheater Corporation	New York, N. Y.
Alberene Stone Company	New York, N. Y.
Allen-Bradley Company	Milwaukee, Wis.
Allis-Chalmers Mfg. Company	Milwaukee, Wis.
Altorfer Brothers Company	Peoria, Ill.
Aluminum Company of America	Pittsburgh, Pa.
American Brass Company	Waterbury, Conn.
American Brown Boveri Electric Corp.	New York, N. Y.
American Electrical Heater Co.	Detroit, Mich.
American Engineering Company	Philadelphia, Pa.
American-LaFrance & Foamite Industries, Inc.	Utica, N. Y.
American Steel & Wire Company	Chicago, Ill.
Anaconda Copper Mining Company	Waterbury, Conn.
Albert & J. M. Anderson Mfg. Co.	New York, N. Y.
Apex Electrical Mfg. Company	Cleveland, Ohio
Armstrong Electric & Mfg. Corp.	Huntington, W. Va.
Asbestos Shingle, Slate & Sheathing Co.	Ambler, Pa.
Associated Gas & Electric Company	New York, N. Y.
Atwater Kent Mfg. Company	Philadelphia, Pa.
Automatic Electric Heater Company	Philadelphia, Pa.
Automatic Washer Company	Newton, Iowa
Bailey Meter Company	Cleveland, Ohio
Bartlett Manufacturing Company	Detroit, Mich.
Walter Bates Steel Corporation	Gary, Ind.
Benjamin Electric Mfg. Company	Chicago, Ill.
Bennett-Watts-Haywood Company	New York, N. Y.
James G. Biddle	Philadelphia, Pa.
Blackstone Mfg. Company	Jamestown, N. Y.
Blaw-Knox Company	Pittsburgh, Pa.
Bohn Refrigerator Company	St. Paul, Minn.
Brown Company	Portland, Me.
Buckeye Twist Drill Co.	Alliance, Ohio
Buda Company	Harvey, Ill.
Bullard-Davis, Inc.	New York, N. Y.
Burndy Engineering Company, Inc.	New York, N. Y.
Burroughs Adding Machine Co.	Detroit, Mich.
Business News Publishing Co.	Detroit, Mich.
Case-Shepperd-Mann Publish. Co.	New York, N. Y.
Central Flatiron Mfg. Company	Johnson City, N. Y.
Century Electric Company	St. Louis, Mo.
Champion Switch Company	Kenova, W. Va.
Chance Company	Centralia, Mo.
Chicago Flexible Shaft Company	Chicago, Ill.
Cinderella Appliances Corporation	New York, N. Y.
Cinderella Washing Machine Co.	Cleveland, Ohio
Circle F Manufacturing Company	Trenton, N. J.
Clark Electric Water Heater Division of McGraw Electric Company	Omaha, Neb.
Colt's Patent Fire Arms Mfg. Co.	Hartford, Conn.
Combustion Engineering Corporation	New York, N. Y.
Conover Company	Chicago, Ill.
Cooper Hewitt Electric Co.	Hoboken, N. J.
Copeland Sales Company	Detroit, Mich.
Copperweld Steel Company	Glassport, Pa.
Corning Glass Works	New York, N. Y.
R. W. Cramer & Company, Inc.	New York, N. Y.
Crane Company	Chicago, Ill.
Curtin-Howe Corporation	New York, N. Y.
Dampney Company of America	Boston, Mass.
Davey Tree Expert Company	Kent, Ohio
DeLaval Separator Company	New York, N. Y.
Delta-Star Electric Company	Chicago, Ill.
Doble Engineering Company	Medford Hillside, Mass.
Dover Mnaufacturing Co.	Dover, Ohio
Duncan Electric Mfg. Company	Lafayette, Ind.

NAME	ADDRESS
Thomas A. Edison, Inc.	Orange, N. J.
Edison Electric Appliance Co., Inc.	Chicago, Ill.
Electric Machinery Mfg. Company	New York, N. Y.
Electric Power Equipment Corp.	Philadelphia, Pa.
Electric Service Supplies Co.	Philadelphia, Pa.
Electric Storage Battery Co.	Philadelphia, Pa.
Electric Vacuum Cleaner Co.	Cleveland, Ohio
Electrical Research Products, Inc.	New York, N. Y.
Electrical Testing Laboratories	New York, N. Y.
Electrol, Inc.	St. Louis, Mo.
Engineering Products Corporation	New York, N. Y.
Estate Stove Company	Hamilton, Ohio
Eureka Vacuum Cleaner Company	New York, N. Y.
Federal Electric Company	Chicago, Ill.
Fitzgerald Manufacturing Co.	Torrington, Conn.
B. C. Forbes Publish. Co., Inc.	New York, N. Y.
Four Wheel Drive Auto Co.	Clintonville, Wis.
Franklin Air Compressor Corp.	Norristown, Pa.
Frigidaire Corportaion	Dayton, Ohio
Fuller Lehigh Company	Fullerton, Pa.
G & W Electric Specialty Co.	Chicago, Ill.
Gage Publishing Company, Inc.	New York, N. Y.
Gainaday Electric Company	Pittsburgh, Pa.
P. A. Geier Company	Cleveland, Ohio
General Appliance Corporation	New York, N. Y.
General Electric Company	Schenectady, N. Y.
General Office Equipment Corp.	New York, N. Y.
General Outdoor Advertising Co., Inc.	New York, N. Y.
G. M. Gest	New York, N. Y.
Giant Manufacturing Co.	Council Bluffs, Iowa
Gillinder Brothers, Inc.	Port Jervis, N. Y.
Graybar Electric Company	New York, N. Y.
Edwin F. Guth Company	St. Louis, Mo.
Habirshaw Cable & Wire Corp.	New York, N. Y.
Hall Electric Heating Co., Inc.	Philadelphia, Pa.
Hankscraft Company	Madison, Wis.
Hanovia Chemical & Mfg. Co.	Newark, N. J.
Hoe Corporation	Poughkeepsie, N. Y.
Holophane Company, Inc.	New York, N. Y.
Hoover Company	Chicago, Ill.
Hubbard & Company	Pittsburgh, Pa.
Hurley Machine Company	Chicago, Ill.
Hynes & Cox Electric Corp.	Albany, N. Y.

Light's Golden Jubilee to Be Inaugurated at N. E. L. A. Convention

THE international celebration of the Golden Jubilee of Light—marking the 50th anniversary of the invention of the incandescent light bulb by Thomas Edison—will be inaugurated in Atlantic City, beginning on the evening of Friday, May 31, the inauguration festivities to continue throughout the 52nd convention and exhibition of the N. E. L. A.

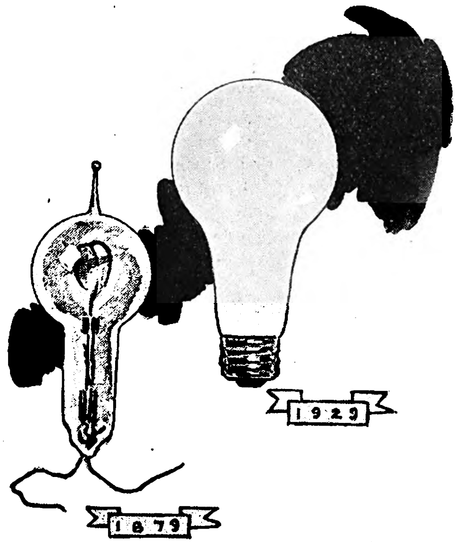
In addition to opening the world-wide festival of light, the event will initiate a brilliant light display throughout the entire resort and approaching highways, to last until Oct. 21, the anniversary date.

It will also mark the beginning of an official celebration of Atlantic City's Diamond Anniversary as a duly incorporated community, as well as formal opening of the Atlantic City Auditorium in which the N. E. L. A. convention and exhibition will be held—the largest convention hall in the world.

This year marks the 50th of fifty golden years of lighting and electrical progress. And Oct. 21, 1929, will mark the 50th anniversary of Thomas A. Edison's invention of the first practical incandescent lamp, the very cornerstone over which the electrical industry has raised itself.

This golden year, then, and that golden day offer not only the vast lighting industry but the entire civilized world that long-waited-for opportunity to pay a fitting personal tribute to the master inventor for the greatest of all his gifts to mankind, and that opportunity to celebrate fittingly the 50th birthday of the incandescent lamp, both with Light's Golden Jubilee.

According to extensive plans already taking shape, Light's Golden Jubilee will be just as much an occasion for serious retrospect, profound appreciation and genuine inspiration as it will be a celebration, gala, festive and jubilant. It will be a celebration exclusive to no one company, to no one industry, nor will it be limited to any single nation. It is upon the people of the world, upon a grateful people, that the blessings of Edison have been showered. Light's Golden Jubilee offers the electrical trade a golden opportunity to join hands with the world at large in standing beside the man who gave the world light without flame, the man whose life is an inspiration to all, the man who stands for all that is American and good. Individually and collectively the men of the electrical industry owe it to themselves to make Light's Golden Jubilee the greatest tribute ever paid a living man.



Light's Golden Jubilee received its first formal suggestion on Edison's 82nd birthday. At a luncheon of the Edison Pioneers, those men who were associated with Edison in his pioneering days, their fellow member, John W. Lieb, tentatively outlined the celebration. The Pioneers then unanimously approved the following resolution:

> "Resolved, that the President of the Edison Pioneers be requested, and he is hereby authorized, to appoint a committee of five from its membership to propose to the electrical industry at large the organization of a Sponsoring Committee which may prepare plans for the appropriate celebration of the Golden Jubilee of the Incandescent Lamp occurring during the year 1929."

Light's Golden Jubilee sponsoring committee, which is now being formed, will have at its disposal an adequate organization to plan, to direct, and to coordinate the many events and activities of the jubilee. It is expected that the time between now and the National Electric Light Association convention at Atlantic City in June will be devoted to crystallizing and perfecting plans and organizations, and preparing essential literature. It is the general plan to start the first of a great series of events relatively early with the thought of leading up to a tremendous climax on Oct. 21—the 50th birthday of the incandescent lamp. Oct. 21 will be "The Night of Light" and will be the occasion of a celebration and tribute to Thomas Edison which will encircle the globe and echo through the years that follow.

Light's Golden Jubilee should be the occasion for jubilee lighting festivals all over the nation. It will call upon all branches of the industry to promote the movement nationally and locally. Every retailer, wholesaler, central station and manufacturer will have a twofold opportunity—first, of active direct participation, and, second, of encouraging others to participate.

The jubilee will be magnificently supported by Henry Ford, Edison Pioneers, and close personal friends of Thomas Edison. All of Edison's original laboratories and machines are being moved to Dearborn, Mich., where Menlo Park will live again and through the years as part of the great Ford Museum of American Industry. Henry Ford's plans in connection with the jubilee celebration will be announced at a later date.

Light's Golden Jubilee makes it timely to consider the tremendous progress that has been made in lighting during the past 50 years. It may be summarized in this way:

Light one room with a 100-watt Mazda lamp for 1000 hours. Light another room to the same degree of brightness with replicas of the first commercial incandescent lamp. Pay seven cents per kilowatt-hour for current. Now light a third room just as brightly with candles, and keep replacing the candles for 1000 hours. Here would be your light bill at the end of that time:

Room 1—100-watt Mazda lamp..	$ 7.35
Room 2—Original incandescent	68.75
Room 3—Candles	1,500.00

Those figures tell the story of the greatness of Edison's gift to the world of light and 50 golden years of development which are incorporated in the Mazda lamp of today.

Light's Golden Jubilee comes at the close of one lighting era and at the introduction of a greater one. In the past the manufacturers' problem has been to make lamps fast enough, and the central stations' problem to extend power lines far enough to supply all the people with light by which to *see*. Now with the mechanical part of the job mastered, we are beginning to provide light by which to *live*. 1929 will bring gratifying strides in that direction. Light's Golden Jubilee will create a wider knowledge of and a deeper interest in lighting and electricity than has ever existed before.

This, then, save for the minute details, is Light's Golden Jubilee. The electrical industry at large owes it not only to its great chief, Edison, to stand beside the man whose genius made possible this industry and a world forever free from darkness, but to itself as well.

Light's Golden Jubilee Essay Contest

MR. N. H. BOYNTON, in charge of Sales Promotion, National Lamp Works, representing Light's Golden Jubilee Committee, offers a first prize of $150 cash and a second prize of $75 cash to the two employees of member companies of the National Electric Light Association who prepare the two best essays on "Light's Golden Jubilee" in conformity with the following rules and regulations:

1. All essays must deal with the subject, "Light's Golden Jubilee."

Note: These essays in general should briefly treat on the history of light, its successful stages of development, the invention of the incandescent lamp by Mr. Edison, what modern lighting means both to our present civilization and the electric light and power industry and through light, what the electric light and power industry has contributed to the progress of the nation.

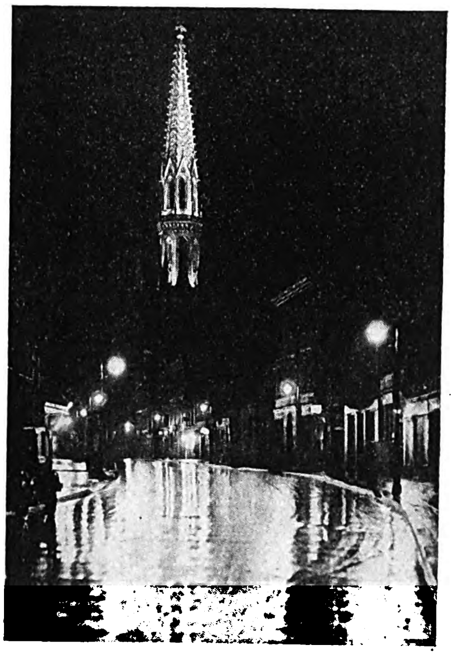
2. Any employee of a member company of the National Electric Light Association, excepting officers, managers, general office department heads and those who specialize in the sale of light, is eligible.

3. All essays must be clearly written on one side of the paper, $8\frac{1}{2}$ x 11 inches in size, and should be double spaced and, if possible, typewritten.

4. Essays should not contain more than 1500 words.

5. All essays should be mailed to W. M. Skiff, Chairman Speakers' Bureau, Nela Park, Cleveland, Ohio, so that they will be received by him on or before May 15. Any essays received after that date will be ineligible for the prize.

6. All essays should be addressed as above, marked "Essay Contest," and must be sent in a plain envelope, postage paid, with no identification marks on either the envelope or the essay, other than those described in the following paragraph.



7. Accompanying each essay must be a plain, sealed, blank envelope (no return card) inside of which shall be a 3 x 5 card bearing the name and address of the contestant, the name of the company by which he or she is employed and the department with which he or she is connected. As each essay is received it will be marked with a number and the sealed envelope accompanying it will be marked with the same identifying number. The numbered envelopes will all be filed until after the judging of the essays. On selection of the essays adjudged the winners, the envelopes bearing the corresponding numbers will be opened and the winners announced. By this method of not identifying the writers of the competing essays until after the awards have been made, absolute unprejudiced judging of all essays submitted is assured.

8. In making the award the essays will be adjudged in a uniform manner, points being allowed on the following basis:

	per cent
(a) The amount of the more important material in the essay pertaining to the subject...........	50
(b) Original thoughts and suggestions developed by the contestant, which show the mental grasp of the more important material....	35
(c) General composition of the essay —clearness, and brevity with which thoughts are expressed; neatness and appearance.......	15
	100

9. Nationally known persons are being carefully selected to act as judges and their identity will be revealed in due time.

10. The decision of the judges shall be final.

Lighting the Convention Hall

(*Continued from page* 199)

In the ballroom, which will seat 5000 and in which there is a ninety-foot ceiling, indirect color and general illumination is accomplished by cove and lunette method. A total of 136 floodlights of 250-watt size are set in arches and coves and equipped with daylight lenses. Alternate red, blue, green and other colors are obtained with many of these projectors fitted with color screens. In addition, there are 26 lunettes with 36 smaller lamps in each. Varied color effects and dimmer control are obtained from the stage. The total connected load of the convention hall will be 1442 kilowatts.

Entertainment Features of the 1929 Convention

THE 52nd Convention, from June 3 to 6, will mark the opening of Atlantic City's new municipal auditorium, and its splendid accommodations and many facilities will be used throughout the entire convention program. The spacious and beautifully decorated ballroom is particularly adaptable to our purposes in that there is a large stage at one end, which will be used for the orchestra, and a large balcony at the other, which will be appreciated by those not wishing to dance. The ballroom is larger than that of the Million Dollar Pier, and with its excellent ventilation facilities it will prove most enjoyable for all the evening entertainment.

The performance of B. A. Rolfe's orchestra last year was so satisfactory that the Entertainment Committee feels that it is quite fortunate in securing its services again. The orchestra will supply music for all the entertainment features of the Convention.

The new auditorium will be the center of activity every evening. The Convention will open Monday evening with a reception to President and Mrs. Arkwright, after which there will be dancing until midnight. On Tuesday evening there will be dancing from 8.30 until midnight. Special features, the details of which will be announced later, are to be interspersed with the dancing on Wednesday evening, which will last from 8.30 to 1 o'clock. The Public Policy Committee session will be held this year on Thursday evening. Frieda Hempel, soprano, and Albert Spalding, violinist, will be the soloists, and they, together with Mr. Rolfe's orchestra, will supplement the Public Policy program. At the conclusion of the session there will be dancing until 1 o'clock, and this will conclude the convention entertainment program.

Mr. Rolfe

Frieda Hempel

Albert Spalding

The Committee has provided entertainment for the ladies on Tuesday and Wednesday afternoons, leaving Thursday free, as at preceding conventions. Seaview Day, the first of these events planned exclusively for the ladies, will be on Tuesday. There will be an 18-hole golf tournament in the morning, and in the afternoon contests in putting, obstacle golf, croquet and dart throwing. Prizes will be given in all these events.

Tables and cards will be available to those wishing to play, but no prizes will be awarded. Tea will be served at 4.30, with music by the orchestra.

A card party has been planned for Wednesday afternoon in the Assembly Room of the Hotel Chelsea, which the Entertainment Committee feels is ideally suited to the purpose. Ladies may make up their own tables and select any card game they may wish to play. There will be prizes for each table. The orchestra will play at tea, which will be served at 4.30.

The B. A. Rolfe Orchestra, which has been engaged to furnish music for the Convention

Association's Work Reported at National Executive Committee Meeting

THE Executive Committee of the Association held a meeting March 7 at N. E. L. A. Headquarters, New York, with Vice-Chairman M. S. Sloan presiding in the absence of President Arkwright. Reports from the Geographic Divisions, the four national sections and special and general committees indicated satisfactory progress in association activities.

In the absence of Treasurer P. S. Young, Managing Director Paul S. Clapp submitted a financial statement of the association for the first seven months of the administrative year. The expenditures are well within budget appropriations. The books of the association have been audited by Price, Waterhouse & Company, certified public accountants. The collection of dues for this year is progressing satisfactorily.

Membership Committee

Chairman Howard K. Mohr reported the membership of the association as of March 6, 1929, as follows:

Class A (electric light and power companies)	752
Class B (officers or employees of Class A members)	15,286
Class C (invited members)	105
Class D (electrical manufacturing companies)	405
Class E (officers or employees of Class D members)	2,523
Class F (associate members-contractors, dealers, etc.)	405
Class G (officers or employees of Class F members)	658
Class H (foreign central station companies)	131
Class I (officers or employees of Class H members)	67
Total membership	20,332

New membership applications approved at this meeting were for Class A, 25; Class B, 1020; Class C, 1; Class D, 34; Class E, 176; Class F, 42; Class G, 80; Class H, 9; Class I, 14.

Geographic Divisions

The presidents, or their representatives, of all Geographic Divisions were present, including Canada. The committees of the divisions as a whole are satisfactorily functioning in accordance with formulated programs, under the guidance of their own executive committees.

Any slow-down in activity in particular committees was ascribed to lack of early formulation of programs. Liaison and coordination with headquarters was favorably commented on by several divisions.

Increased commercial activity is generally observed. The Canadian Division requested assistance on Codes and Standards, particularly as related to wiring. The Middle West Division emphasized improvement in accounting activity. Geographic Divisions report more intensified work toward definite objectives with tendency toward special conferences of those in a common field. Rural Electrification Conferences in Southeastern, North Central, and Southwestern Divisions were most successful. The Great Lakes Division announced plans for a corresponding conference; also for a Merchandising Conference, Chicago, March 19. The Northwest Division reported the benefits of a public speaking competition. All divisions told of their convention plans. Industry development, public attitude, and business conditions were, in general, reported to be most favorable with excellent future outlook.

Vice-President Sloan called upon Messrs. Gerard Swope, President of the General Electric Company, G. E. Cullinan, Vice-President of the Graybar Electric Company, and James R. Strong, President of the Tucker Electrical Construction Company, representative respectively of the manufacturer, wholesaler, and contractor-dealer viewpoint.

Mr. Swope stated that the general manufacturing outlook is good. He advised that the National Electrical Manufacturers Association is steadily increasing in membership, strengthening its organizational structure, and is cooperating excellently with the N. E. L. A.

Mr. Cullinan advised of strengthened associational organization among wholesalers and jobbers. Much attention is being given to increased services and facilities to both manufacturers and merchandisers.

Mr. Strong outlined the new organization plans of the Association of Electragists, International which provide for regional chapters. He commented favorably on the cooperation with the N. E. L. A., and the steady improvement in understanding between the electric light and power companies and the contractor-dealers throughout the country.

Public Relations National Section

Chairman J. F. Owens advised that the Section is well organized and that all committees are functioning. A meeting of the Section Executive Committee was held, Wednesday, March 6, with large and representative attendance.

Mr. Owens presented recommendations emanating from the Cooperation with Educational Institutions Committee, which were approved by the Executive Committee, Public Relations Section. These resolutions appear in the report of the Public Relations Executive Committee Meeting printed elsewhere in this issue.

The National Executive Committee approved the recommendations and requested that they be reported to the Public Policy Committee.

Mr. Owens submitted a recommendation from the Customer Ownership Committee, W. H. Hodge, chairman, for increased support by member companies to the National Better Business Bureau. The services of the National Better Business Bureau were recommended as providing added protection to customer-owners of public utility securities against the pressure to dispose of these holdings for speculative investments of uncertain value. The National Executive Committee endorsed the National Better Business Bureau and recommended increased support of its work.

The Public Speaking Committee proposes a National Public Speaking Contest. No definite plans have yet been prepared. It is proposed to hold elimination contests in member companies, States, Geographic Divisions, leading finally to a National Contest at the National Convention. The idea in general was approved and the Public Relations Section instructed to formulate more definite plans for resubmission.

An appropriation of $600 was recommended for the purpose of having six

16 mm. prints each made of the films, "Back of the Button," and "Yours to Command." Upon motion made and seconded, such appropriation was authorized.

Mr. Owens commented on the rapid development of sound-moving pictures and advised that portable talking equipment will be available shortly. He suggested that headquarters be equipped with a portable talking-movie projector as soon as one is available, this to be in charge of an operator and circulated throughout the country as an added service from the Association to Geographic Division, Sectional, and other important group meetings. The National Executive Committee strongly endorsed the idea as progressive, and approved its being carried out.

Accounting National Section

Chairman J. F. Ford advised that this section is well organized and fully functioning. Programs previously formulated have been consistently continued. In addition, special attention is being given to accounting for interconnection, merchandise accounting, budgeting, financial questions relating to mortgages, trust agreement, and latest questions in the field of investment trusts. The thirteen-month calendar is being studied. Special attention is being given to machine applications for all office accounting. The Statistical Committee has participated actively in the development of the Research Statistical Department at headquarters. Increased participation by the Geographic Divisions and fuller coordination between the Geographic Division committees and the National Committees has been marked during the year. Two group meetings of the entire section have been held, both in Chicago, on Oct. 29 and Feb. 25. Chairman Ford expressed appreciation of the cooperation of various members at headquarters in his work.

Commercial National Section

Chairman Marshall E. Sampsell reviewed the reorganization of the section this year into three major bureaus with related committees grouped under each bureau in order to harmonize more completely with Geographic Division structure. This plan is working extremely well and excellent cooperation has been attained between the Geographic Divisions and bureaus. Increased attention to commercial development is observed in all sections of the country.

The restricting factors in commercial progress are being analyzed and definite plans put into action for dealing with them. The section, through its Wiring Committee, is cooperating with the Codes and Standards Committee and the Engineering National Section on the National Electrical Code and the whole wiring situation. The Promotional Rates Committee is studying rates for domestic service and their relation to the development of the household appliance load. Quality standards of appliances as affecting costs and performance are under study.

The section has stimulated intensive training of commercial men working in specialized fields. Training school conferences, usually for one week, have been held, as follows:

Lighting Service, Harrison, N. J.—Feb. 11-16, 1929, and Commercial Cooking, Chicago—Sept. 17-19, 1928; and Industrial Heating Course will be given at Case School of Applied Science, Cleveland, May 13-24 of this year.

Public acceptance and market situation on a broad basis has been studied by the Industry Sales Conference. Mr. Sampsell stated that the original plan as submitted was being revised downward. It is expected the final sales plan will be announced before the National Convention.

Because of rapid development commercially of rural electrification, a Farm Appliance Sales Committee has been formed to coordinate with the Rural Electric Service Committee.

A domestic water heating survey covering the entire country is now being conducted with the assistance of the Engineering Section. Plans for a national educational movement in food preservation, involving all types of refrigeration, have been formulated and will be announced in Chicago, on March 22.

Engineering National Section

Chairman E. C. Stone reported the committees of the section all in active operation. Their slogan, "More System Capacity per Dollar of Investment," has been emphasized and definitely reflected in their work. Two new committees, namely, "Power Stations Engineering" and "Special Engineering Research," have been organized and are functioning. The Power Stations Engineering Committee has held two meetings; a third meeting will be held during the Engineering Section Meetings, Memphis, Tenn., March 11 to 14. The plan of operation of the Special Engineering Research Committee for coordination and stimulation of research within the industry, will also be discussed at Memphis.

The section recognizes the growing importance of its participation in the development of codes and standards affecting power system engineering. At the request of the National Fire Protection Association, a committee to develop a code for power stations and substations was organized. The committee was active during the winter and in record time submitted its recommendations to the N. F. P. A. meeting in New York during January.

A most competent group of technical advisers was enlisted to assist in the recent considerations of the National Electrical Code. This technical advisory group did splendid work in analyzing the problem of grounding interior wiring, and in formulating suitable engineering recommendations for presentation to the Electrical Committee of the N. F. P. A.

Chairman Stone advised that special subcommittees have been organized in the main body of the section and in the Geographic Divisions, to cooperate with the company code representatives, in working out problems connected with Codes and Standards.

Special and General Committees

Codes and Standards Committee. Chairman Irvin W. Day reported that this committee has been largely concerned with the National Electrical Code. In the matter of grounding, a tentatively satisfactory solution has been reached due to the objectionable provisions of the 1928 code having been eliminated by the adoption of the 1925 grounding rules for use in the 1929 code. It is expected that the 1929 code will be approved for circulation by June. The cooperation of the fire insurance and manufacturer representatives was acknowledged.

It is the view of this committee that the industry should take a more active part in codes and standards formulation. Definite steps to crystallize an organizational structure within the industry to this end are under way. An outstanding accomplishment has been the organization of a group of company code representatives. In response to a letter from President Arkwright, some eighty-five such representatives have been designated by company executives. This group will supply information from local areas needed for determination of code policies, observe operation of codes, and become points of referendum. The compilation of information on accidents and their causes has commenced.

A meeting of company code representatives will be held in Chicago on March 18 and 19, at which time the development of the National Electrical Code along with all other codes and standards projects of interest to the industry will be discussed, and working plans for continuity of work by the group established.

Insurance Committee. Chairman W. H. Sawyer reported a meeting of his committee at headquarters, Tuesday, March 5. The committee is concerned with broad industry relations with fire insurance companies, also with the technical aspects of fire insurance protection. Subcommittees have recently been named to deal with Insurance Statistics and Rates, Education, and Electrical Apparatus Clause. Recent meetings have included officials of leading fire insurance companies. The common fields of interest are better understood. The committee has cooperated closely with the Codes and Standards Committee on the National Electrical Code.

Rate Research Committee. Chairman L. R. Nash stated that an outline of committee work has been prepared. The committee continues its studies of basic rate structures and rate movements for diffusion of electric light and power member companies.

Rural Electric Service Committee. In behalf of Chairman Charles F. Stuart, Dr. E. A. White reported on the plans for the National Rural Project in Maryland. The respective State rural experimental investigations in progress for a number of years have yielded a wealth of valuable information but have necessarily confined themselves to developing the most obvious uses for electricity on the farm. None of them is equipped to go much beyond this point. The National Rural Project will carry this experimentation still further forward. Mr. George W. Kable, director of the National Project in Maryland, was introduced.

Civic Development Committee. Chairman John B. Reynolds reported that a major activity of this committee has been cooperation with the Policyholders' Service Bureau of the Metropolitan Life Insurance Company in a basic study of industrial development in the United States since the war. This will analyze migrations of industry, new industrial development, and interpret causes. Interviews and surveys covering the entire nation have been made by trained economists. The report will be presented March 29 at a special conference called by the Metropolitan Life Insurance Company.

The committee has made its services available to the General Federation of Women's Clubs which is stimulating a Better Homes Movement. This is directly in line with the aims of the Civic Development Committee, which is interested in all phases of community improvement.

Advertising Committee. Chairman Frank Leroy Blanchard reported that a meeting of this committee was held in January. Interchange arrangements for advertising copy have been made between many of those directing company advertising. Copy is also made available to headquarters for assistance in preparation of the weekly Advertising Copy Service regularly furnished member companies. Quality of utility advertising is steadily improving. The committee reports that the volume of advertising by electric light and power companies is small relative to other businesses. It strongly recommends larger use of advertising by the companies. A questionnaire to secure much needed facts on utility advertising will shortly be circulated.

Exhibition Committee. Chairman E. W. Goldschmidt reported that the exhibition this year will be in the New Municipal Auditorium. The space allocation is 20 per cent more than at any previous convention. The exhibitors are making most elaborate plans for showing the latest advances in their respective fields. The dedication exercises of the new auditorium will be held Friday, May 31, and the exhibition will be open to the public over the week end.

Educational Committee. Chairman Fred R. Jenkins reports steady increase in number of employees taking courses offered by the committee. The new course in advanced accounting has met excellent favor. The committee is studying industry needs for further courses.

Prize Awards Committee. Chairman W. H. Onken, Jr., stated that announcements of the prizes offered by the association had been sent out and that papers in competition were commencing to come in, indicating wide spread interest. The committee has under consideration other prize awards which have been tendered the association. Most of the prize awards now offered are provided from year to year. Consideration is being given to a plan to stabilize the awards through the creation of an award trust fund.

Association of Railway Electrical Engineers. Mr. E. W. Lloyd told of meeting with the Committee on Purchase of Electrical Energy of the Association of Railway Electrical Engineers. He pointed out the lack of standardization of railroad power contracts through the country, and suggested its consideration by the association. The subject was referred to the Rate Research Committee.

Approved — Insull Medal Applications. Applications for Insull Medals, approved and recommended by the Accident Prevention Committee, were approved as follows:

Walter Clarendon Shults, Public Service Co. of Oklahoma, Tulsa, Okla.

Andrew J. Huling, Portland Electric Power Co., Portland, Ore.

George A. Herman, General Electric Co., Erie, Pa.

Norbert A. Shubert, General Electric Co., Erie, Pa.

Edward Andrew Gale, The Connecticut Light & Power Co., Waterbury, Conn.

Ronald Reid, Vermont Hydro-Electric Corp., Rutland, Vt.

G. D. Hardy, Tide Water Power Co., Wilmington, N. C.

Blair Jenkins, Jr., Carolina Power & Light Co., Raleigh, N. C.

L. E. Danks, Mountain States Power Co., Albany, Ore.

Alfred Walsh, New York State Gas & Electric Co., Ithaca, N. Y.

Stanley Albert, Harlem Valley Electric Co., Sand Lake, N. Y.

C. R. Holland, Chester Valley Electric Co., Coatesville, Pa.

Hanson G. Cookson, Central Maine Power Co., Pittsfield, Me.

David Shelton, Gulf States Utilities Co., Beaumont, Tex.

R. W. Dickerhoff, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

Victor William Galleth, The New York Edison Co., New York, N. Y.

Thomas Ashworth, Fall River Electric Light Co., Fall River, Mass.

Memorial for Presidents of the Association. Managing Director Clapp recommended that a suitably engrossed memorial be prepared by the association to be presented to each outgoing president in recognition of his services to the association and the industry.

Upon motion made and seconded, this recommendation was unanimously adopted.

Behind the Veil
The Tears of the Heliades

By Ernest Greenwood

(Number 1 of a series)

IN the interior court of what would seem today like a modest, one-story bungalow, built of sun dried brick and faced with stucco, reclined an old man with snow white hair and beard. He was called Thales and he was one of a group of Ionian wise men whose thought has come to be regarded as a forerunner of both philosophy and science. There was no philosophy before the time of these Greek sages, and they had little to build on—Greek philosophy and Greek science had everything to create.

THE year was approximately 600 B. C., and the old man was dreaming. Before him, on a small table, were a number of beautiful fluorescent stones of almost every color of the rainbow and named "Elektrons," or, as we know it, amber—not the yellow amber which is the slave of My Lady Nicotine, but the costly sun stones—"Tears of the Heliades." According to the Greek myth, the Heliades (some historians have called them the Elektride Maidens) were sisters of Phaethon, son of Jupiter, who, destroyed by his father because of an unauthorized adventure with the family sun chariot, was buried on the shore of the Eridanus. His sisters, accompanied by their mother, found his tomb and remained beside it, weeping bitterly. Jupiter, incensed at the part which they had played in the Celestial joy-ride, turned them into trees from whose branches their tears continued to fall. These tears, we are told by Ovid, were hardened by the heat of the sun and became Amber, "which the beaming river receives and sends to the Roman ladies for their adornment." Milton refers to this beautiful myth in the lines:

"Him the thunderer hurled
From the empyrean headlong to the gulf
Of the half-parched Eridanus, where weep
Even now the sister trees their amber tears
O'er Phaethon, untimely dead."

Mr. Greenwood is the author of "Aladdin, U. S. A.," a study of the electrical industry published in 1927 by Harper and Brothers, and the more recently published "Prometheus U. S. A.," a study of fuels and their relation to modern civilization. This is the first of a series of articles under the general title of "Behind the Veil" which will portray against a social-historic background, the evolution of the electrical industry and the chief personalities that have been instrumental in its growth

Opinions as to the origin of amber have always been contradictory and conflicting, but if we accept it as the first substance to give evidence of the phenomena of electricity, its genesis must be of historical interest. It is quite possible that one of the reasons for the veil of mystery surrounding it has been the fact that the Phoenicians were always inclined to give the Greeks mysterious accounts of their trading tracks, which they did by means of fables and pretended ignorance. Their story of the source of amber is typical. It reads:

"Passing behind Trinacria (Sicily) one comes to the mouth of the ocean which encircles the whole earth. One steers past Atlas on the left—the pillar of the vaulted sky—together with the gate of the Sun and the happy elysium, leaving to the right, on the Cimmerian strand, the portals of the nether world and the sources of the ocean in a silver rock sustaining the heavens; then, amidst incredible dangers, one follows the dark shore to the isles of tin, and to the stream Eridanus, in which the costly sun-stone, elektron, falls in drops from certain resinous trees, by reason of the glowing heat of Helios sailing back to Colchis." The isles of tin were presumably British Isles, and this would indicate they had proceeded up what is now known as the English Channel. On the other hand, the Eridanus is supposed to be the river Po in northern Italy.

AS a matter of fact, amber is the resin of an extinct *pinus* which flourished in the lower Tertiary period. It was "distilled by pines which were dead before the days of Adam" and, according to W. Arnold Buffum, is "widely distributed over the Northern portion of the earth." This resin has been fossilized as a result of long submersion in the ocean and from a tree gum has been transformed to a "gem."

Amber was the most important gem known to the ancient civilized world, and for ages was the principal factor in the intercourse of various and widely separated peoples. Often in the past, Sicilian amber sold at a price far beyond the price of diamonds. According to Buffum, "the peculiar, distinctive quality of Sicilian amber—that which distinguishes it from its fellow gems and gives it its indescribable charm and expression—is its fluorescence; 'that property which some transparent bodies have of producing at their surface, or within their substances, light different in color from the mass of the material, as when green crystals of fluorspar afford blue re-

---

Author's Note: The author wishes to express to Dr. Charles Burton Gulick his deep appreciation of his book "Modern Traits in Old Greek Life" from which much of the material in this article was obtained. He also acknowledges his debt to E. Arnold Buffum, author of "Tears of the Heliades or Amber as a Gem," Georg Brandes, author of "Hellas," John Pentland Mahaffy, author of "What Have the Greeks Done for Modern Civilization?" Geoffrey Parsons, author of "The Stream of History," and Gustave Glotz, author of "Ancient Greece at Work."

flection. This curious property is due not to the difference in the color of a distinct surface layer, but to the power which the substance has of modifying the light incident upon it.' Thus, in my collection, specimens may be seen which show sapphire blue, pale rose, violet and ruby hues, and every graduation of color from the tenderest gray to the most brilliant green—the actual color of the pieces being straw-yellow and faint olive." Amber may range in color shades from faint blue to deepest azure, and from pale rose to the intense red of the pigeon blood ruby, and amber stones may be red, green, violet, orange, or blue. Their hues are lovely and have been spoken of as the "hues of the primeval world."

THE supposed occult powers and manifestations of electrical phenomena caused amber to occupy the minds of the wise men of ancient times, and particularly that group of Greek philosophers and scientists who are always in the background of all modern thought. Perhaps it was Thales, or perhaps it was some other one of the Greek philosophers, who first began to contemplate the meaning of this peculiar attraction which amber, when rubbed, seemed to have for other substances. It may very well be that this attribute of amber was not the first to be noted by mankind. It is quite possible that the lode-stone of the City of Magnesia which Aristotle tells us about when he says, "the stone has a soul since it moves iron" may have been the first substance to engage man's attention to some natural law which he could not understand. It may have been noted long before the time of either Aristotle or Thales. But in any event Thales may serve as well as any other as a symbol of those times when men first began to actually think and to wonder about the Universe. Naturally, electrical attraction would occupy their most serious attention.

Thales, whom the electrical industry credits with the first observation of electricity, lived on the threshold of what has sometimes been called the "Golden Age of Pericles," but what is better known as the "Classical Age." Today we still carry on much of the thought and customs of these early Greeks and are facing the same fundamental problems which engaged their best poetry and philosophy. Yet in those days both rich and poor lived in houses which the average American worker would sneer at as being only fit for animals.

The city house presented to the street a blank wall pierced only by a door and, perhaps, by one or two small windows, set high up. The streets themselves were so narrow that often a special tax was imposed upon the owner of a house having a door that opened outward. It is not difficult to speculate as to what would happen today if some legislative genius, intent on finding ways and means for providing income for government, would suggest a tax on houses having doors opening a special way or windows that swung in and out instead of sliding up and down.

If one entered the better houses he was greeted by a surly porter and passed through either a vestibule or directly into a court. The floor might have been the original earth beaten hard or strewn with pebbles or, perhaps it was paved with flagstones or mosaic. Mats and rugs were scattered about and, if it happened to be in the Periclean age, one saw rare and expensive rugs imported from the East. Behind columns which line this court were small rooms for the slaves; a sort of sun parlor in which much of the family life went on; and beyond, on one side a living room or "men's hall." The private rooms of the women were either on the further side of the court or on the second floor which is reached, not by a stairway such as we know, but by a ladder or steep stairs going up from some remote room.

THE furniture would seem to us to be almost primitive although much of its design survives in our furniture today. There were couches somewhat similar to a modern couch, or divan, or chaise longue. The chairs were of three types: stools without arm or backs used by both men and women at work; chairs with reclining backs; and the chair of state. Tables were used mostly at meals and were brought in and set before the guests. In the sleeping rooms were found couches of handsome wood, often inlaid with ivory, gold and silver and piled high with rugs. Later, mattresses came into use, stuffed with vegetable pods, wool or feathers and covered with embroidered spreads.

Water in the "Golden Age of Pericles" had to be brought in daily by slaves or by the daughters of the household from a spring or fountain. Like the primeval community fires these springs or fountains were the beginnings of the first public utilities.

We, who can have any amount of light at the touch of a button, can have but a faint idea of the difficulties which beset these ancients, who first began to speculate about the phenomena of electricity, when night time came. In the days of Homer servants brought in torches of pitch pine and these were often used in later periods. In the classical period they had earthenware or bronze lamps which were small, shallow vessels having one or more holes for wicks and filled with olive oil. "Burning the midnight oil" is an expression which can easily be traced back to this era. The thrifty householder was always complaining when a slave put too large a wick in the evening lamp.

HEATING facilities in these early Greek houses were of the most primitive type. Nothing in the way of central fires were known until Roman times when the wealthier citizens had the crude hypocaust—a fire in a brick vault in the cellar and tended by slaves. Some Greek houses had fire places but chimneys were unknown and the warmth obtained hardly compensated for the discomfort caused by smoke. Others were heated by open braziers containing small fires of charcoal. In most houses one had to go outdoors to get warm. Diogenes — the same Diogenes who was always walking around with a lantern looking for an honest man—had but one request to make of Alexander the Great, and that was to get out of his sunlight; whence came, perhaps, the phrase, "a place in the sun."

But, what these early Greek homes, of the days when electricity as a recognized force was struggling to be born, lacked in material comforts was more than counterbalanced by the beauty and variety of their vessels of earthenware, bronze and even precious metals. The inventive and artistic genius of potter, metal worker and vase painter found full expression in almost inconceivable variety. It must also be remembered that these early Greeks first embodied the enterprise and inventive genius of Europe and America; they were the first Westerners. They required comfortable chairs as contrasted with the Oriental who does not. The contrast between the elaborate furnishings of a modern American home and the meagre appointments of a Japanese house is directly due to the example of the Greeks.

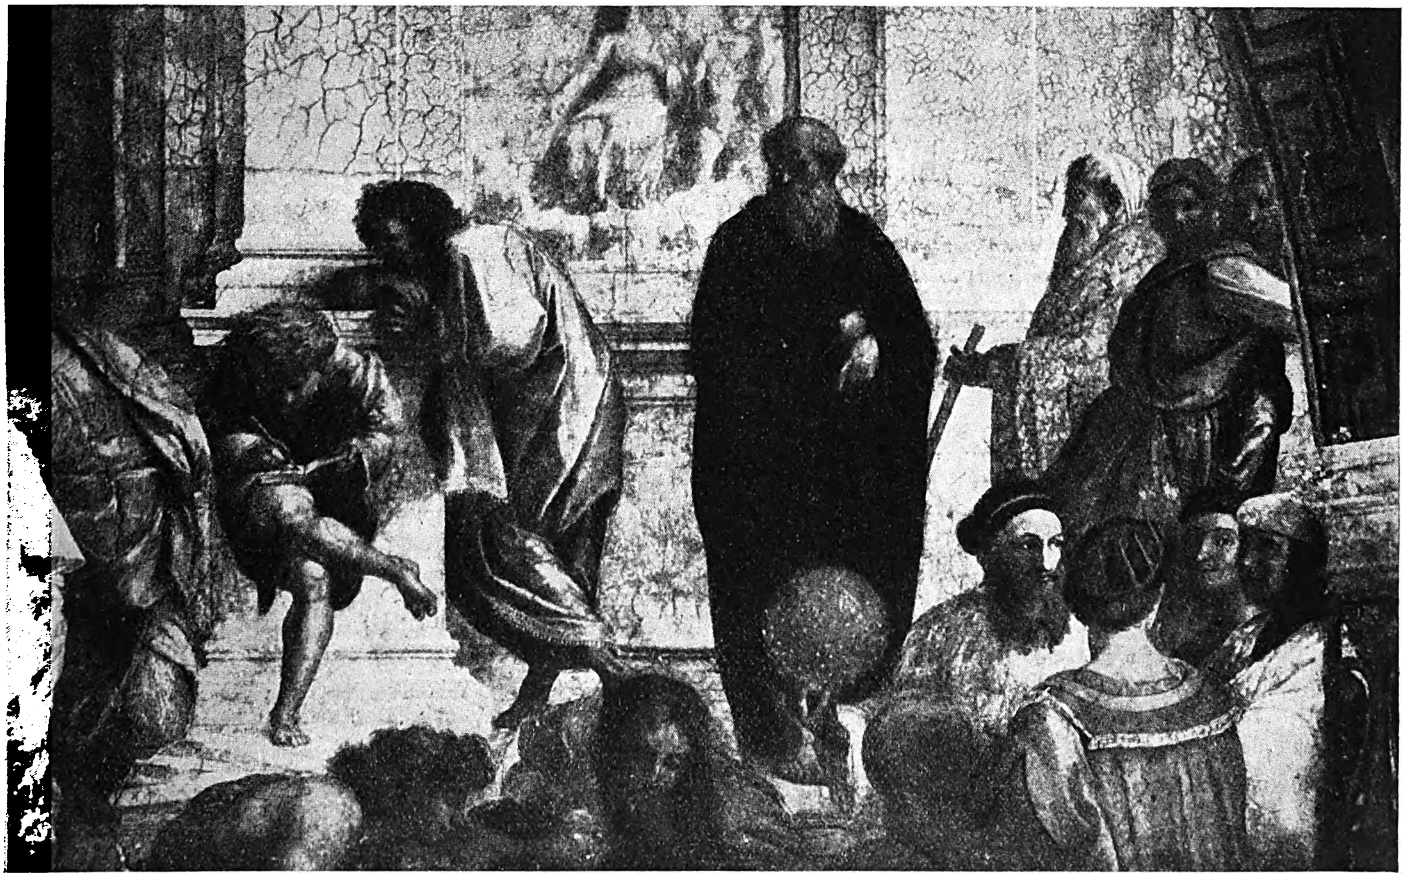
"If 'the apparel oft proclaims the man'," says Professor Charles Burton Gulick in his charming book *Modern Traits in Old Greek Life,* "the quantity and quality of his food are apt to mark his character quite as well." It was Socrates who first said "Bad men live to eat and drink, good men eat and drink to live," while Acoumenos, the Greek physician, proclaimed that "the fool that eats till he is sick must fast till he is well." The daily fare of the early Greeks was marked for its simplicity and frugality. The Persians, who according to Herodotus, were in the habit of roasting whole oxen, horses, camels, and asses in extravagant barbeques, regarded this Greek fare as poor and scant and the luxurious Romans had only contempt for the "hungry little Greeks."

While much of our present day civilization is directly traceable to the life and thought of the days just preceding Pericles, there were many customs which might very well have been continued even to today. For example, a private dinner was conducted with pleasurable simplicity. The guests were invited orally and any guest was quite at liberty to bring a friend with him. It was the height of bad manners to be late and there was no waiting for a guest who failed to appear at the appointed time. From these simple private dinners came the permanent dining clubs, conducted along lines which, no doubt, would be approved by the Rotary or Kiwanis Club of today. These associations were called "eranos" and the members contributed, each his share, to the cost of the meal. Various individuals were appointed to make all of the arrangements including the entertainment just as a modern luncheon club has its committees on arrangements, entertainment, etc.

IT was in the eranos that the first idea of a fraternal organization was born. If one of the members was so unfortunate as to be arrested and fined the members paid the fine. If a member was captured in war his ransom might be provided by his fellow members. It also often happened that these clubs departed from an exclusive social purpose and became mixed up in politics. They were sometimes accused of being "propagandists" although they no doubt insisted that their work was purely educational. Thus we see that our own great national controversy—what is educational and what is propaganda—is, after all, as old as civilization itself.

Another, and what may seem to some folks a rather quaint early Greek institution, was the sacredness of family life and a firm belief in monogamy. The binding character of family relationships extended even to remote cousins and no crime was so great as the shedding of a parent's or a brother's blood. Divorce was almost unknown and both in the theory and practice of statecraft the thought predominated that the community was an association of citizens all of whom were related and descended from a common ancestor.

Professional "emancipators of women" of today might do well to study Greek history. Apparently there was no necessity of going around shouting "equal rights for women." Equality was assumed; not asserted. Poetry and sculpture (especially the terra-cottas and grave reliefs) attest the affection felt for wives, mothers, sisters and nurses. Persons of breeding upon seeing a woman on the street did not ask "whose wife is she?" but rather



Detail from the painting by Raphael in the Vatican

THE SCHOOL OF ATHENS

Thales is the figure holding the staff in the group of three at the extreme right of the picture "whose mother is she?" Women of this period were noted for learning and wit as well as for beauty, and men of rank like Pericles and Socrates, treated them with the greatest respect.

On the other hand there were quite as many people in those days who felt that "woman's place is in the home" as there are in America today. Hector admonished Andromache that her proper work "is at the loom." Had Menander lived in this day and age he would have been extremely unpopular with women's political organizations for he it is who said: "woman's place is at the loom, not in the Assembly." Yet in the fifth century B. C. Euripides prophesied the "new time for the new women" and in the Hellenistic age women came to own and manage property, found institutions for education and religion, and build notable monuments to the dead.

WHILE most historians are inclined to disregard the science of these early Greeks it must be remembered, as Dr. Gulick tells us, "that the Renaissance itself was the rediscovery of Greek and Roman inspiration, and that without the vocabulary which the Greek and Latin bequeathed, modern terminologies would be helpless. Merely Teutonic or Celtic material could never have supplied terms so convenient as electron, ion, cathode, to say nothing of telegraph, telephone and radio." All of the professional sciences had their root in the speculations of these Ionian philosophers from Thales onward. It was Thales who predicted eclipses much to the astonishment of his contemporaries.

For example, the atomic theory is the basis of chemistry and physics today. Yet Democritus (fifth century B. C.) and Leucippus a hundred years earlier, assumed an infinite multitude of indivisible particles or atoms, and attributed to them motion, which brought them into contact with one another and produced the universe. That the earth was round was claimed by the oldest Pythagoreans who also conceived the idea that it and the rest of the planets revolved around a central "fire." This idea, however, was not accepted until the days of Copernicus (sixteenth century A. D.). Again we find that much of what we know today was being thought of in the days of Thales when he contemplated the fact that amber, the Tears of the Heliades, had the power to attract other objects when rubbed.

It is in the fifth century B.C. that we find the genesis of the so-called "ghost writer." Every party to a law suit had to conduct his own case, which, with due apologies to the legal profession, seems like a good idea. This gave rise to the profession of "speech writer" who, if our historians report correctly, was the fore-runner of the modern lawyer. The speech writer studied the case, prepared a speech for his client, who committed it to memory and recited it before the court. Demosthenes, who had to earn a living, was one of these ghost writers and once was accused of preparing speeches for both sides in a law suit. Any ghost writer today will be glad to admit that he can write material on either side of a controversy.

THERE were blackmailers in those days wearing an air of respectability just as we have blackmailers today. They would bring trumped up charges against rich men unless they were paid. They were known as informers and at one time, according to Dr. Gulick, threatened to defeat all justice in the courts. Their modus operandi bears no slight resemblance to the attacks which are being made continually on so called "big business" and which is so hard to combat because men engaged in large scale affairs have little time to worry about those who, lacking in any particular ability themselves, can find little to do but attempt to tear down.

And so, if we had the time and the space to consider all of the recorded history of the days of Thales, his contemporaries and the hundred years which followed, we might easily find that the things which we are doing today were being dreamed of 2600 years ago even though the Ionian philosophers, Pericles, or even Alexander the Great had no idea how these thoughts might be put to some practical use. Turning to medicine we find that these early Greeks called it an "art" rather than a "science" and the surgeons had instruments which strangely resemble surgical instruments of today. Some of their theories of education would put to shame the average American Public School. Archimedes laid the foundation of mechanics and engineering. Physical culture was quite as important (if not more important), as it is now. Solon instituted financial legislation in which one can detect the rudiments of the gold standard which still prevails. The "hot dog" vender peddled his meats on the streets (according to Aristophanes) and the poor little old woman hurried to market to sell her embroidery. The dry climate and poor soil resulted in considerable skill in irrigation which is duly referred to the U. S. Reclamation Service. Credit was extended but bills had to be paid by the end of the month. Marine insurance was a real business. Port duties, customs, commissions and rake-offs were as common as they are now. Transportation was as good as it ever has been until within the last hundred years. Historians and philosophers got little more in the way of recompense than they do today. One might say that, after all, there is little under the sun that is new.

PROPAGANDA

An expert on public relations
  Has hired all the slaves of the pen
And tells all the best publications
  Just what they should publish, and when.
If a joke makes you laugh 'till you think you will bust
It was likely inspired by the pants-button trust.

The fictional gems that inspire you
  In even the best magazines,
Are really intended to fire you
  With zeal to buy bathtubs or beans;
And the various poems entitled "To Spring"
  Might be propaganda for any old thing.

You may read, if you want to grow wiser,
  But be careful, whatever you do,
And let no sly proselytizer
  Put anything over on you.
And sigh, as you come to the end of a book;
"He's clever, at that, the press-agenting crook."

—STODDARD KING, in *Spokesman-Review*. Clipped from the *School Executives' Magazine*.

AND so, perhaps, we may return to our old man reclining in the interior court of his modest, one-story bungalow, contemplating his bits of Sicilian amber and occasionally rubbing them with a cloth. What is he thinking about? Is he dreaming of a force that may some day do the work of the world? Does he have an old man's vision of the great steam turbine, the water fall harnessed and doing the work of a million slaves, the electric motor lifting from the backs of man the drudgery and hopelessness of every-day toil, the transportation, communications, and everything else which electricity has contributed to our everyday lives and which seem commonplace to us? Perhaps Thales was thinking of these things—who knows?

James H. McGraw Prize Paper

STREET LIGHTING

A Much Neglected Source of Revenue

By W. T. BLACKWELL

FACING every electric service company is the problem of increasing both the load and the revenue. This has been accomplished in various ways—by appliance sales, by home economic activities, by lighting campaigns, by the functions of a power department, etc. But in the midst of all of this agitation about new business, the field of street lighting—one which has tremendous potential possibilities both from a load and a revenue point of view—has been almost entirely neglected. Street lighting has been considered in the light of a moral obligation to the community, an exchange for a franchise, a nuisance and unprofitable, while in reality it is very profitable business and business which shows gratifying increases as the result of the efforts placed upon it.

Definition

In speaking of street lighting, care should always be taken to define exactly what is meant. For the purposes of this paper the subject of street lighting is divided into two general classes, utilitarian and ornamental.

Utilitarian street lighting is defined as the standard equipment furnished by a utility for street lighting purposes and supplied with service from the pole lines.

Ornamental street lighting is defined as ornamental posts and tops supplied with service from underground.

Modern Standards of Street Lighting

Since the electric service companies which serve only one municipality are relatively few, the remarks in this paper may be considered applicable to the street lighting problem of any electric service company, but particularly so to the problem of the company supplying a number of cities and towns and having the usual relations with municipal, county and state governments.

Mr. Blackwell's paper won the James H. McGraw third prize, for 1927-1928. Mr. Blackwell is a member of the Street Lighting Committee of the National Electric Light Association, and of the Street Lighting Committee of the Illuminating Engineering Society. He has been active in the lighting industry for a period of 25 years and is at present General Lighting Representative of the Public Service Electric & Gas Company

There never has been available any evaluation of what comprises standard street lighting. The nearest approach to such an evaluation was made by the New York State Conference of Mayors and Other City Officials and the Empire State Gas and Electric Association in June, 1924, at which time certain standards of illumination were agreed upon. A marked step forward has been made in the principles of street lighting in the 1927 Report of the Illuminating Engineering Society Committee on Street Lighting which states:

"In reviewing the situation at its first meeting, March 27-28, 1925, the Committee reached the conclusion that it would be desirable, if practicable, to formulate a statement of such principles of street lighting as might find acceptance on the part of its members. While engaged upon this task the Committee undertook at its first meeting to list the elements which make for effectiveness in street lighting and to ascertain by assignment of numerical weights what differences of opinion are entertained by the committee members on these fundamentals.

"The differences proved to be so great that the formulation of a statement of principles of street lighting was deferred, not to be undertaken, as events proved, until two years later.

"During the present year, however, the committee has formulated certain statements of Principles of Street Lighting which it has adopted tentatively and which it offers for canstructive criticism. The committee expects to engage in a revision of these statements in the future and invites all who may be interested to contribute their views for consideration in connection therewith.

"The statement is presented in the following chapter of the report.

"The Major Purposes of Street Lighting are:

"1. To promote safety and convenience in the streets at night through adequate visibility.

"2. To enhance the community value of the street.

"Street lighting thus serves utilitarian purposes, and like other utilities, it serves its purpose best if it is artistically satisfying. Best visibility is usually computable with most pleasing appearance. A street lighting system cannot be artistic unless it provides good visibility.

'The beautiful rests on the foundation of the necessary.'—*Emerson.*

"Thus arises the further purpose:

"3. To accomplish the illumination of streets with the greatest practicable promotion of the æsthetic qualities of the street and of the street lighting equipment."

Classification of Streets

The report also undertakes the classification of streets into:

Primary business streets.
Secondary business streets.
Heavy traffic thoroughfares.
Medium traffic thoroughfares.
Light traffic thoroughfares.
Residence streets.
Alleys.
Highways.

and also makes recommendations for the intensity which is desirable.

Intensities

"For thoroughfares, average horizontal illumination of at least 0.2 foot-candles, attainable with available illuminants in good practice, at an expenditure of about

---

EDITOR'S NOTE: Space limitations prevent the publication of supporting charts and other material which accompanied Mr. Blackwell's paper on "Street Lighting." If this material is desired it will be loaned upon request to the Editor.

> 40 lumens per linear foot* is to be considered a minimum. For streets exceeding 80 feet in width more light is required; under dense traffic conditions much higher illumination is desirable.
>
> "For residence streets average horizontal illumination of at least 0.05 foot-candle should be provided, with higher values recommended. In good practice this minimum can be obtained with an expenditure of about 10 lumens per linear foot."

The committee also adopted the following resolution with regard to sizes of street lamps.

> "RESOLVED: That there are no conditions of street lighting prevailing in the United States which justify the use of smaller than 1000 lumen lamps and that the 2500 lumen lamp is the smallest size which can be used with good economy."

From the standpoint of civic improvement, the first consideration is to build up the intensity of illumination on all of the streets rather than following the practice of many municipalities of spending the major portion of the appropriation to build up the intensity on a few blocks of one main street where a comparatively few tax-payers receive the whole benefit of the improvement.

Such a program would be infinitely more acceptable to the electric service company as the company would not be involved in the expense of underground service.

Civic Aspects of Problem

When first settled, the majority of the cities and towns in the country gave very little if any attention to the question of city development or future growth. When the developments did come along and growth was necessary, the municipalities, instead of expanding along some preconceived, well-laid plan, simply spread in the most convenient direction and there are many that just grew up. Most remarkable strides in growth have occurred with very recent times. In taking care of the increase in population, municipal officials have simply made arrangements for the first essentials in comfort—sewers, paved streets, sidewalks, etc.—but have paid relatively little attention to the street lighting.

Now that most municipalities have developed a civic conciousness, there is a stimulus for adequate street lighting. The movement is not a fad, for the question is one of paramount importance in the modern world. It is the result of a long neglected need. The average municipality has spent just enough in street lighting to make the darkness outside the lighted area more confusing. Towns and cities everywhere are realizing both the tangible and intangible benefits to be derived.

Good street lighting is one of the surest indications of municipal efficiency and it can be acquired and maintained at a moderate expense. The interest on the investment made in good street lighting systems is returned annually in the form of stablized or increased property values and a decrease in street accidents. Good street lighting creates a favorable impression of the thriftiness and progressiveness of the administration and of the tax payers, it advances civic pride, improves the sanitary conditions of the streets, is an excellent advertisement and aids in the promotion of other improvements.

Persons passing through a municipality in automobiles receive a favorable or unfavorable impression of the town from the condition of the street lighting. Good street lighting attracts industries and buyers. Furthermore, it facilitates the movement of traffic, assists the fire and police departments and discourages street crimes.

Former Police Commissioner Bingham of the city of New York is credited with the statement that one street lamp is as good as ten policemen.

Street Crime Study in Cleveland

A study made in Cleveland before and after installing good street lighting revealed some interesting data.

A. *All Street Crimes Committed at Night*

Months and Years	*Outside of Better Lighted District*	*Inside of Better Lighted District*
Oct., Nov., Dec., 1915, before improvements	350	73
Oct., Nov., Dec., 1916, after improvements	539	67
Increase, per cent	54	Decrease 8

B. *Major Street Crimes Committed at Night* (Burglary, Hold-up, Automobile Stealing)

Months and Years	*Outside of Better Lighted District*	*Inside of Better Lighted District*
Oct., Nov., Dec., 1915, before improvements	222	32
Oct., Nov., Dec., 1916, after improvements	434	37
Increase, per cent	95	15

While the number of street crimes committed at night was increased by 54 per cent in a year outside of the improved district, in the district where the new lighting was available the street crimes were 8 per cent less. It was further shown that taking only the major street crimes of burglary, hold-up and automobile stealing, the increase in a year outside the improved district was 95 per cent while on the better lighted streets it was only 15 per cent.

The time covered by this study was the beginning of the so-called "crime wave." In 1915, the year before the better lighting was available, the study shows seventeen out of every hundred crimes committed on the streets of Cleveland took place in a small district in the downtown business section which embraced less than 1 per cent of the street mileage of the city. In 1916 crimes in the business section were but little more than one-half, to be exact, 59 per cent, of what might well have been expected had no improvements been made in the lighting. Crime diminished as light increased.

Traffic Accidents

Another very important aspect is the reduction in traffic accidents. Messrs. Anderson and Hass, in an analysis of traffic accidents, have been able to show that at least 17.6 per cent of city night traffic accidents is due to inadequate street illumination. This figure is checked closely by A. W. Devine of the Department of Public Works, Massachusetts, who places the percentage of night accidents due to insufficient illumination at 13.5.

A canvass made by the Illuminating Engineering Society Committee on Street Lighting during 1927, among several organizations engaged in or having relations toward the promotion of safety failed to disclose any statistics which might be employed in determining the relationship of improved street lighting to safety in the use of streets at night. Among the institutions consulted were:

New York Safety Conference, Albany, N. Y.
National Safety Council, Chicago, Ill.
National Automobile Chamber of Commerce, New York.

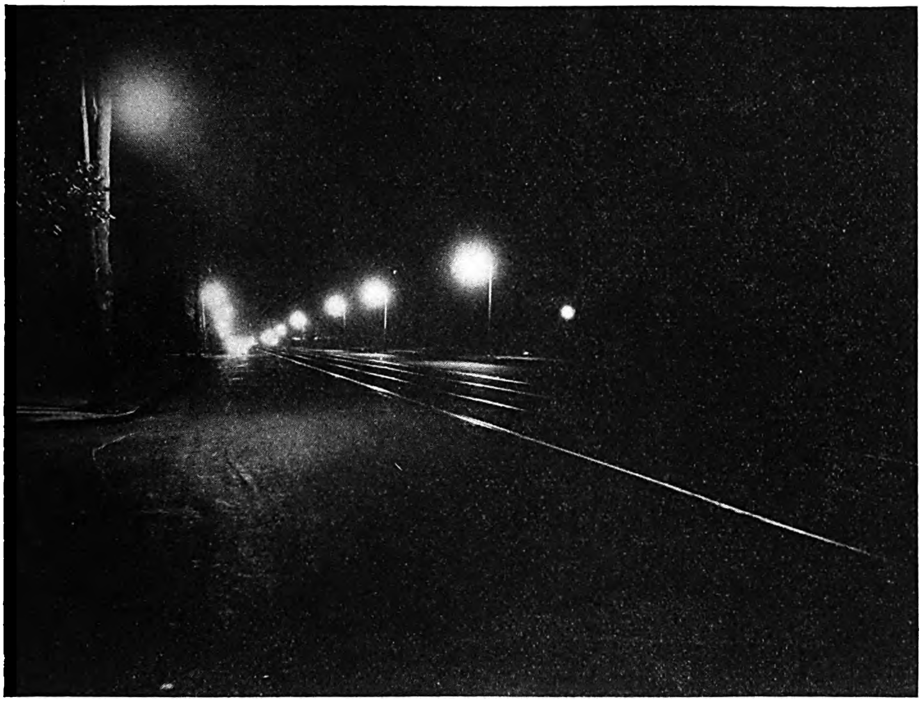
Studies of statistics to develop information of this sort are always complicated by the presence of other factors of varying intensity and importance, including traffic and population density, type of population, nature of streets, automobile headlighting practice, etc. Whether or not any definite relationship can be established remains to be seen.

Early in its deliberations this committee recognized that bright automobile headlights are detrimental to good vision in the streets. While the committee did not reach an agreement

---

*The term "lumens per linear foot" and like expressions are measures of light output for street lighting. Such a term is analogous to "watts per square foot" employed in interior lighting. It does not take into account the proportion of light which reaches the street and is but a rough and incomplete index of the grade of illumination.

Where lumens or watts per linear foot are shown without specification, a street of not more than 80 feet between property lines is contemplated.



Elizabeth Street, Newark, N. J.

that headlights ought to be abolished in well lighted streets, the members did agree that conditions are better in such streets when automobile headlights are not used.

Recent statistics show that there is one automobile for every five inhabitants in the United States. This, together with the increase in power transportation, which includes buses, street cars, motor trucks, etc., makes it imperative that good lighting of the streets and highways be provided in order to facilitate the movement of this ever increasing traffic. Vehicular traffic cannot be moved expeditiously with safety to the pedestrian where proper street lighting does not exist.

Central Station Aspect

Of all of the services rendered by the central station to the public, street lighting is probably of greatest importance since it is the obvious or outward and visible symbol of the company's service to the public. Street lighting is of public benefit and affects all of the inhabitants in a community as well as the people passing through after dark. Where there is no street lighting or where the system is inadequate, a hazardous condition exists. The lack of interior electric lighting is annoying, but not necessarily hazardous.

Street lighting business is a profitable source of revenue. The average rate for a 100-candlepower lamp is greater than the annual bill for electric energy of the average residence customer. Compared with residence customer business, street lighting requires a minimum of investment. There are no meters or service connections, nor is it necessary to index meters or replace burned-out fuses. There is no credit risk and a minimum of accounting expense.

Recommended Methods for Developing Street Lighting Business

The street lighting load is of value to the electric service company as the greater part of it falls off-peak and because of its high load factor.

In developing street lighting business a thorough knowledge of all of the elements of the problem is very essential. This includes an analysis of the territory with the present conditions, a knowledge of the requirements and an estimate of the potential possibilities to serve as a guide for progress.

In analyzing the territory the following items should be considered for each municipality: population area in square miles, total miles of streets, miles of streets for each classification, tax rate, street lighting expenditure per capita, percentage of the tax dollar expended for street lighting and name of the official in charge of street lighting. This information should be tabulated for comparative purposes. Tabulations should also be prepared showing the number and sizes in lumens (or candlepower) of street lamps in service for each municipality.

The estimate of the potential revenue which may be received from each municipality is helpful as it permits a determination of the present saturation in street lighting for each municipality as well as for the entire territory.

Surveys should be made both for individual streets and for the entire municipality. Where possible, the improvement of individual streets should be made part of a comprehensive plan of improvement covering the entire municipality and spread over a period of, for example, five years. This insures an excellent street lighting system ultimately, makes certain that each in-

Somerset Street, Plainfield, N. J.

dividual improvement is correct with reference to the finished whole and spreads the cost of such improvements so that it shall not be too great in any one year. Spot maps should be prepared showing existing overhead and underground zones, existing pole lines, existing lamps and sizes of same indicated by one set of symbols and proposed lamps indicated by a second set of symbols.

With such a method both the municipality and the electric service company will derive benefit, since the lamps will be installed in the correct locations the first time, which means a saving on both sides as it eliminates the necessity of doing the work over.

Most municipalities are grateful for such assistance, as they do not have street lighting engineers in their employ, and where street lighting engineers are employed these plans can be carried out in cooperation with them.

Tests of present and improved street lighting conditions give helpful data.

Definite plans should be presented to the municipality early enough in the year so that it will be possible to have provision made for the improvements in the annual budget for the following year where funds are not available for immediate changes.

Substitution of Larger Lamps for Smaller

Another method which is successful is the substitution of larger for smaller candlepower lamps. The substitution of 100 cp. for 60 cp. or smaller involves no change in equipment, and usually the substitution of lamps larger than 400 cp. requires no change in equipment. The expense involved in such substitutions is found in the increased cost of the larger lamp and in the greater amount of energy which it consumes, both of which factors are provided for in the established rate for the larger lamp.

Analysis of Costs

Most electric service companies have been selling street lights and not street lighting. Street lighting involves not only correct sizes of lamps, but proper spacing and mounting heights as well. The municipalities are endeavoring to buy street lighting, but due to their unfamiliarity with the subject they are prone to base their opinion as to the efficacy of a system largely on the total number of lamps rather than on the amount of light emitted by each lamp and the spacing between lamps. To illustrate the point: the rate of the Public Service Company for a 60-cp. lamp is $26.50, for a 100-cp. lamp, $32.75, and for a 250-cp. lamp, $58.00, where less than 50 lamps are in use in one municipality. Since the 60-cp. lamps only deliver 600 lumens, it is possible to obtain approximately a 40 per cent increase in light with only a 25 per cent increase in cost by changto a 100-cp. lamp. A similar increase in light can be obtained by using the 250-cp. lamp which gives 2500 lumens at a cost of slightly more than twice the cost of a 60-cp. lamp, but with more than a 400 per cent increase in light. Where the reasons for correct mounting height, proper spacing and the use of larger lamps are pointed out to municipal officials, they are quick to appreciate them and to take advantage of the benefits.

Methods of Financing Street Lighting

In the majority of the municipalities the street lighting costs are met with funds raised by general taxation, but increased costs are sometimes met in other ways. The following historical note indicates one method which was employed in Boston in 1772:

> "In Boston it was somewhere about 1690 to 1700 that the town placed iron fire baskets on the corners of its most frequented streets to be kept filled and burning by the night watchmen going their rounds.
>
> "It was not until many years later, in 1772, that a meeting of the citizens was held to discuss means for more adequately lighting the streets after nightfall. A committee was appointed of which John Hancock was a member and after considerable discussion it was decided to send to England for several hundred lanterns suitable for street lighting purposes, as the record runs, 'lamps suitable for properly lighting ye streets and lanes of ye town.'
>
> "These lanterns were not paid for from the town's treasury, but a public subscription was taken to defray the expense. Unfortunately, the ship which was bringing them over from England was wrecked off Cape Cod, for, in a letter from a Boston man at that time, he says, 'It is unlucky that Loring had ye lamps on board for our streets. I am sorry if they are lost as we shall be deprived of their benefit this winter in consequence of it.'
>
> "However, some, if not all, of the lanterns seem to have been salvaged; for in the diary of one Thomas Newell under date of January 8th, 1774, is the record, 'Began to make tops (sides?) for ye lamps for ye town.' A little later he must have completed his work, for the record shows that on the evening of March 2, 1774, a number of the lanterns were hung and lighted for the first time and a large concourse of the town's people turned out to see the improvement. So satisfactory were they evidently that a little later two citizens were appointed from each ward to decide upon fitting locations for the remainder of the lamps."

These gentlemen must have been among the first illuminating engineers in this country.

In some states legislation has been enacted which enables the municipalities to improve the lighting on certain streets and assess the cost of the improvement against the benefiting property, or to issue bonds to cover the cost.

With an idea of ascertaining what the conditions are in various states, a questionnaire was issued, with the result that the answers indicated that the greater percentage of the state governments allow the cities to install street lighting—assessing the cost on a front foot basis against the owners of abutting property.

By working with municipal authorities, increases in annual street lighting appropriations can be obtained as the accompanying photostat clippings testify.*

The New York State Conference of Mayors and Other City Officials and the Empire State Gas and Electric Association went on record as follows:

> "The committee also recommends that after the adoption of such program, if additional lighting is desired by property owners on any street, such additional lighting should conform with the type and standard established and be approved by the proper municipal authority. Any cost in excess of the cost of the lighting specified in the program of such street should be assessed by the municipality against the abutting property owners. This assessment should be made on a curb foot basis and not on property valuation."

The street lighting policy of the electric service company should be as broad as is practicable. The company should be willing to proceed on a fair basis with street lighting improvements in each municipality and should have a reasonable program of conversion of overhead to underground service. Where a municipality wishes to proceed with the changeover from overhead to underground more rapidly than is provided for in the company program, the difference in cost should be adjusted by argeement between the company and the municipality, but the company should be willing to allow toward the cost of the underground construction that amount which would normally have been used for the overhead installation. In some states the Utility Commission requires the company to bear the cost of changing the service connections from overhead to underground. The ownership of the poles is a matter of local policy.

Contracts should be fairly worded and rates should be determined on a

SKIND
CLOTHIER 237

Day View—Springfield Avenue, Newark, N. J.

basis which is just to the municipality for the service which it receives and which yields the electric service company a reasonable return on its investment in equipment, energy, etc. The step rate is to be recommended and small discounts for long term contracts, as this offers an inducement to the municipality to purchase in greater quantities.

The street lighting circuit is the pioneer circuit into new sections of a municipality. The commercial business follows. Where municipalities are sold the idea of lighting all of the streets, whether the sections are built up or not, new residence customers can obtain service which they normally would not receive for some time, particularly in these communities where the deposit system on long extensions is in effect.

The lighting of state and county roads and the lighting of parks and bridges presents a different problem. The pole lines erected for such purposes can not be used to obtain or supply other business. Under these conditions it is reasonable that a charge should be made by the electric service company for the pole line extension.

Most state highways are not lighted. The responsibility for this condition has been shifted from the state to the municipality and back again. In the meantime nothing has been done.

The investment entailed in extending service lines to rural communities is so great as almost to stop any general expansion of this order. An electric service company in its function to serve the public, cannot do so at a loss. Heretofore, rural service, except in a few limited sections, has entailed a very considerable loss which required years to make up. Good highway lighting can be installed for about 2 per cent of the investment in highways. This seems a very small amount to spend in order to make the highways safer and more useful. For speedy and safe transportation the highways must be well built and maintained in good condition. This is a recognized fact and large sums are spent annually by municipal, county and state authorities to maintain the highways of the country. Auto trucking requires the use of highways at night even more than in the daytime. Driving for pleasure at night is quite general, and there is always a certain amount of night business driving. With suitable highways the road traffic at night is cumulative. One authority places night traffic at about 20 per cent of the total. If this percentage were increased by illuminating the highways, an economic gain in their efficiency would be achieved. The lighting of the highways furnishes in part the solution to the problem of making rural service profitable.

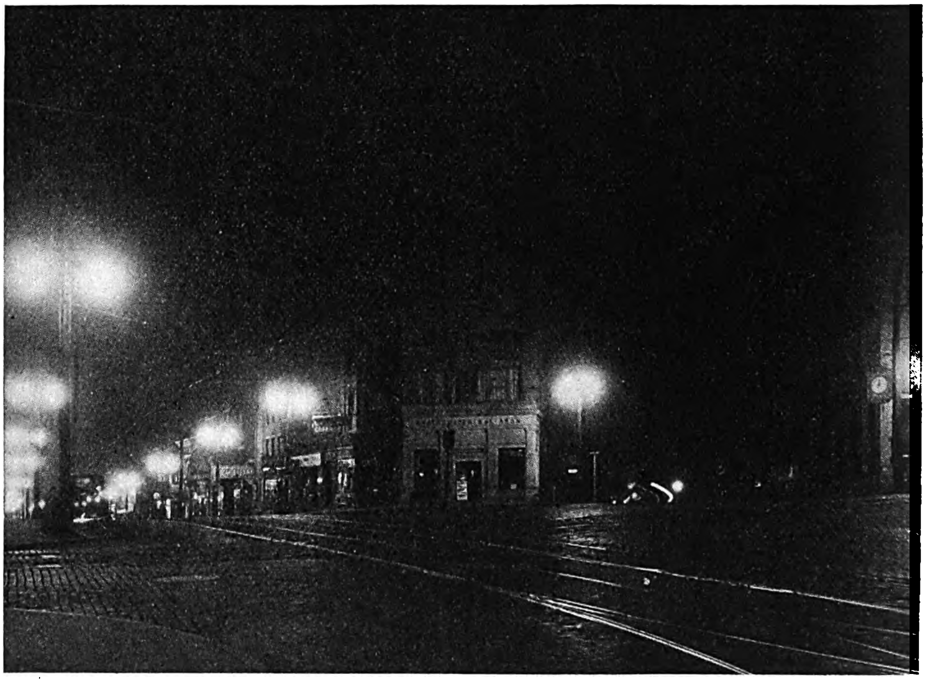
Practical Application

The ideas set forth in this paper are not entirely theoretical. They have been used more or less in their entirety during the last five years in the territory of the Public Service Electric and Gas Company in the State of New Jersey.

This company serves 216 municipalities with electric service and has divided its territory into six divisions: Essex, Hudson, Passaic, Bergen, Central and Southern.

Analysis of Lamps in Service

In order to arrive at a basis for the development of plans for increasing the revenue from street lighting, an analysis was made of the number and sizes of street lamps in service in the



Night View—Springfield Avenue, Newark, N. J.

six divisions and the results plotted on graphic charts. Another chart is plotted from month to month and shows the variation in street lighting revenue from January 1, 1920, to date.

The Lighting Department of the Public Service Company was organized in September, 1922, and began its work shortly thereafter. A study of the annual street lighting revenue figures indicates the result of their effort. While a certain percentage of each year's increase is attributable to normal growth, it may be noted that the slope of the curve prior to the organization of the Lighting Department is very much less than that from 1923 to date.

Statistics were obtained for each municipality showing population, total expenditure for street lighting and tax rate. This showed the expenditure per capita and the percentage of the tax dollar expended for street lighting in each municipality.

Letters to Municipalities

Since but few of the municipalities served have in their employ engineers familiar with street lighting, letters were prepared and sent to the municipal authorities offering the assistance of the illuminating engineers attached to the various districts in making surveys of street lighting requirements for specific streets or in making street lighting plans covering the requirements of the entire town or city for the next five years. The progress made in this work has been most encouraging, and it has been instrumental in securing substantial increases in the municipal budgets for improved street lighting.

In the Bergen Division such a letter was prepared and sent to 70 municipalities. Total of seven replies were received. Among the surveys made resulting from the letters was one which resulted in an increased appropriation for municipal street lighting from $4,000 to $11,000 in a town of 5669 population.

The efforts to have the smaller sizes of lamps replaced with larger lamps have been successful in many cases.

Underground Installation Program

Cities throughout the United States during the past three years have been giving considerable attention to the installation of high intensity ornamental street lighting supplied from underground service. These installations, in addition to the advertising and work of the manufacturers of such equipment, have caused a quickening of interest in this type of lighting in a number of municipalities. Where such requests have been coincident with the company's plans for the installation of underground, the installations have been made, but in other cases it has not been possible to do so due to the absence of underground service, except where the municipalities were willing to pay for the expense of the installation or where business men's organizations, etc., combined to defray such expenses.

Street Lighting Lectures

Talks on the subject of street lighting are given constantly before business organizations, chambers of commerce, etc.

Tests of street lighting conditions and intensity records both before and after improvements are made and placed among the comparative data.

Edison Lighting Institute

The street lighting rooms of the Edison Lighting Institute, Edison Lamp Works of the General Electric Company, Harrison, N. J., are used as exhibits for civic groups and municipal officials.

Increases in Street Lighting Revenue

The increase in street lighting revenue for 1927 over 1926 amounted to $343,795.37, or 11.94 per cent. The comparative revenues from street lighting from January 1, 1920, to date are shown on the accompanying chart. It should be borne in mind that aside from natural growth these increases represent replacements and utilitarian

Percent Increase in Street Lighting Revenue—Public Service Electric and Gas Company of New Jersey

Amplifier Considers Rate Reductions

By AMPLIFIER

BROWSING through a pile of pamphlets the other day I came across the annual report of a great public service system which serves more than 3500 communities located in nearly thirty states and having a combined population of six million people. This system has more than a million and a half customers and a gross income in excess of 150 million dollars. During the past year it spent more than 62 million dollars for new construction.

Had this report contained nothing but statements of earnings and expenses, new properties acquired, corporate rearrangements, dividend actions, financial operations, surplus and reserve accounts, auditor's certificate, a polite letter of transmittal from the president and all of the other deadly data which go to make up the average annual report of the affairs of a corporation it would have had about as much interest for me as a last year's bird's nest. Anyone interested in this sort of literature can easily accumulate a library of scores of thousands. Frankly I am not.

But it just happened that, opening the report at random, I came across a chart, the caption reading: "This chart shows how a proper rate schedule encourages increased use of electric service, with the result that total revenue per customer is increased despite the smaller revenue per kilowatt-hour. In this subsidiary of .... the average cost of residence service has declined from 9.6 cents to 8.3 cents per kilowatt-hour. The average annual consumption by residence customers has increased from 254 kilowatt-hours to 350 kilowatt-hours. The company's revenue per residence customer increased from $24.60 to $29.10." According to the chart all of this had happened between 1922 and 1928.

This was interesting enough to merit further consideration. Turning to the figures for the whole system I found that the cost of electric service, both to domestic and industrial customers, has been steadily declining for years while the average consumption has been steadily increasing. Apparently here is one great concern which has proved the truth of a very simple fundamental principal—lowering costs means increased average sales and while the net profit per unit may be less the increased volume means increased gross returns and eventually increased net returns. This system, while steadily reducing the cost of its service to the consuming public has been spending tens of millions of dollars a year on extensions and improvements. Furthermore its securities are as stable as any on the market today.

"If this is true of this one outfit what is the situation for the whole country?" I asked the Statistical Research Department of the National Electric Light Association. And this is what I was told:

In 1926 the average residence consumer was using 404 kilowatt-hours a year. The average rate was 7 cents and the average household bill was $28.30 for the year. In 1927 the average rate was 6.8 cents, average consumption had increased to 429 kilowatt-hours a year and the average household bill had increased to $29.20 annually. The preliminary figures for 1928 show a still further reduction in the average price to 6.6 cents per kilowatt-hour, an increase in average consumption to 456 kilowatt-hours and an increase in the average household bill to $29.90.

NOW a decrease of 4/10 per cent per kilowatt-hour in the average cost during a period of two years may not seem like a very large amount. But suppose we multiply the average consumption by 19 million (the approximate number of residence customer) and then multiply that total by 4/10 of a cent. The result is $34,656,000. In other words if the 1926 rates had been maintained the domestic electricity consumed in 1928 would have cost the home owners of the United States thirty-four million, five hundred thousand dollars more than it did.

An increase of $1.60 in the annual bill for electricity of the average householder does not seem like a very large amount but suppose we multiply it by 19,000,000 residential customers. The total is $30,400,000. In other words, the people of the United States increased their consumption of domestic electricity to such an extent that they actually spent 30 million dollars more for electricity than they would have spent at the 1926 rate of consumption and average cost.

It has been said that the average householder will spend just so much for electric service each year and no more. But is this true? These figures seem to prove that for some reason or other he does increase his consumption as the price drops until his average bill is increased and the light and power companies are enjoying a steadily increasing gross income with a lower unit of cost which is due to just one thing—increased volume of sales.

THE principal reason is, of course, the increased use of household appliances. I dare say that if a survey were carefully made it would be found that, wherever there is a low domestic power rate, in that territory will be found the greatest market for these labor saving devices. The housewife has found that electricity is cheaper than dirt and she buys a vacuum cleaner. She has found that the electric washing machine and iron has reduced the cost of the weekly wash and greatly simplified laundry work. She finds the cost of current for the electric refrigerator is less than the cost of ice and that there is a still further saving in the elimination of waste of food which keeps far better than in the old fashioned ice box. She finds that the electric sewing machine makes sewing a pleasure while the many dining room appliances enable her to be a hostess instead of a maid when entertaining. The householder finds that the automatic oil burner operated with an electric motor saves him untold drudgery and much incidental expense in connection with the operation of a coal burning furnace.

Once our householder and his wife have installed these things, often because of the decreased cost of current, they will never go back to old methods. Their bills for electricity may be a little higher—it has been shown that the average increase has only been $1.60 a year in two years—but they give no consideration to this fact because they know that the savings in other directions plus the increased comforts and convenience more than compensate for the increase.

Of course, it is quite possible to understand that in those territories where the rates have been maintained or even increased, where there is no power rate for residences and household appliances have to be operated on a light meter with a lighting rate, there must be some cause for complaint. There must be more or less "sales resistance" when the agent for a washing machine or an electric refrigerator calls around. There is the experience of this or that neighbor who has installed some of these things on a lighting rate and they cry aloud to heaven about bills which may even have doubled. The "prospect" for appliances, and therefore for more current, holds back—he is fearful of bills far beyond the capacity of his budget in spite of the increased comfort and convenience.

All of which again suggests that lowering rates will increase consumption and, while the householder's total bill may increase, he will feel that he is getting more for his electrical dollar than ever before, which, after all is a mighty important thing in connection with public relations. I do not believe it is the total bill which the consumer thinks about so much as what he is getting for his dollar.

DESIRING to make one further check on this theory I spoke about it to a friend of mine who lives in a city where one of the largest electrical manufacturing plants in the world has its home. I found that the local light and power company has had exactly the same experience. It has been steadily reducing its rates and with each rate reduction the sale of appliances has been stimulated, the average consumption and the average residence bill has increased. The company is enjoying a constantly increasing revenue and the consumers are being benefited by constant rate reductions.

Or, suppose we take one more example. B. C. Forbes in a syndicated article appearing in at least one of the Hearst newspapers tells a story of rate reductions which is interesting. He starts out with the question: "Is it possible for an executive to take hold of a corporation that is hated by its community and transform it into the most popular of all local enterprises—yet raise it from weakness to strength, from poverty to profit simultaneously with reductions in the prices charged for its product?" He is speaking of a light and power company and at the end of the article answers his own question in this fashion: "Consumption of Electricity, thanks to the lowered rates and attractive service, has doubled in less than nine years. Every large business establishment now prefers to use the company's power, and farm electrification is being pushed." The same old answer.

SURGES AND FLASH-OVERS

Thomas Hood in his famous poem written in 1843, "The Song of the Shirt," had a vision of the modern electric washing machine.

"O men with sisters dear!
O men with mothers and wives!
It is not linen you are wearing out,
But human creatures alive."

BUT after all there is nothing unique about the situation. There is no reason why what is true in other industries should not be true in the light and power industry. Suppose the cost of automobiles should remain stationary or be constantly rising instead of being either steadily reduced or what amounts to the same thing—more automobile value being given for the same money. How long would it take the automotive industry to reach to so-called "saturation point?" Or, in this same connection, suppose the price of gasoline should rise until it compared with the cost of gasoline in Europe. How many big motor cars would be sold and how fast would the demand for gasoline drop?

The theory of the chain store is based on the same principle. Anything, any arrangement, to lower the ultimate cost to the consumer, increase sales and eventually do a bigger gross business at lower unit costs to the buyer.

How has the electric industry gone about creating a situation whereby it could bring about a steady reduction in rates? The first thing of which I can think is by the expenditure of great sums in improvements in the art of generation and distribution. Of course this is another story on which one might write several books. The fact remains that most of the companies, and particularly most of the big companies, seem to have been far sighted enough to recognize this simple principle in merchandizing and to have had sufficient imagination and courage to do those things which have been necessary to bring such a situation about. No doubt it has taken the highest courage and the sort of vision that recognizes the true meaning of "public service." At least so it seems to me.

Lineman? LINEMAN!

By J. R. Patterson

Reprinted, by permission, from West Penn Life

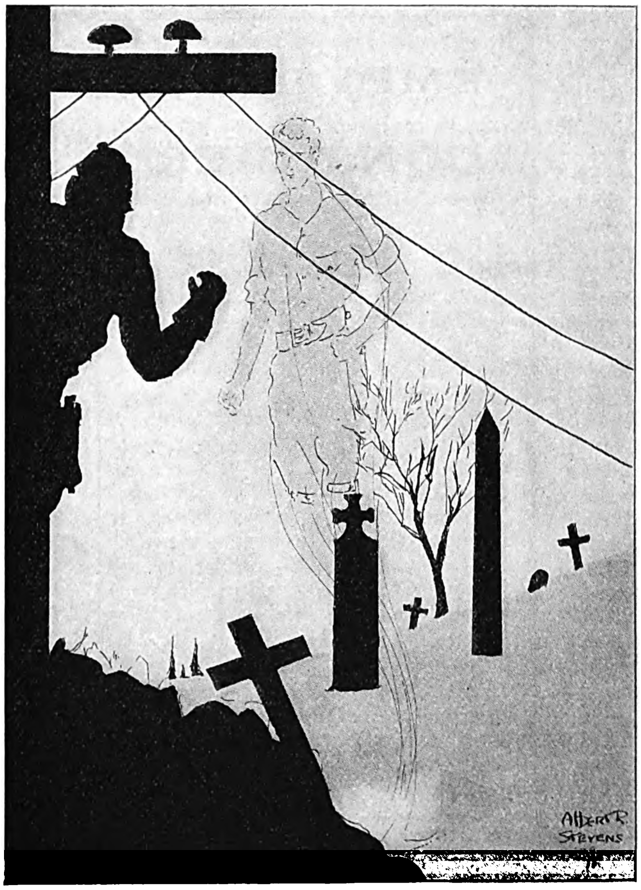
BEYOND the drab town, on the crest of a hill, slender evergreen trees stood like leprous white fingers in their immaculate cloak and swayed eerily over cold, naked stones standing sentinel over mounds that bore mute testimony to the weakness of flesh. Around the plot grew a hedge, offering sanctuary to those sleeping ones within and over it all soughed and shrieked an ice-laden wind.

Just outside the hallowed ground stood the pole, in its jacket of ice, and beckoned lifeless arms to false horizons of midnight while treacherous fires in the sleet lent lavender radiance to the man made cross. Wires of ice swung in from the gloom to pause on the laden crossarm, then writhed on into the opaqueness of the storm.

The weary lineman jabbed spurs into the crust and wormed his way up the pole while the sleet seared his face with fire only to fall in a brittle shawl about his straining shoulders. Numb fingers looped and fastened the safety belt and numb fingers loosened the tie wire about the broken insulator. The thing of clay and ice fell with a muffled thud and bounced, to lose itself in the night beneath the hedge.

Again and again the man strove to lash the wind-whipped wire to the good insulator he held and as often the wire taunted him by slipping from his feeble grasp. Mind willed the hands and arms to do—muscles fought with impulses and the cold seeped in past mackinaw and shirts.

The battle waxed and waned while the man coaxed his poor fingers to do the mind's work. His mood changed; a maniacal desire seized him to weep, to curse, to smash the insulator, his fingers, the universe! Panted oaths took form in whitened breath, to be snatched away by the snarling wind before his ears could hear them. But he knew he was cursing. Hadn't he laboriously formed the words in a mind now sluggish?



A shadow shape took more definite form

"Come, come you, you are my hands! Do this one last job for me, then we can go where it's warm! Help—only need a little help and there isn't a lineman within miles." He sagged down in his belt and lethargy enveloped him.

Below him, he seemed to see a slit of light. The slit widened and widened. Snow and ice and sod rolled back, there was an oblong mellow light, then the light shrank to a slit again, to go out as he watched. A grave had opened and closed!

A shadow shape took more definite form and there stood a smiling man with blue shirt open at the neck and sleeves rolled up. A full tool belt hung around his narrow waist and climbing spurs were strapped to his legs. "Hi, there, Buddy," he hailed.

The lineman's mind brushed a numb hand across a clammy brow and his voice came from far away. "Who—who are you?"

"I'm just one of the sleepers, Buddy. But does it matter? I've been sleeping for a long, long time—since one summer's day. I thought I heard a buddy call for help. But—are you a lineman?"

"You—you—where's your coat?"

"It's pleasant where I've been, Buddy."

"You are a dead man?"

"No, not dead. Just resting."

"I can see through you."

"Am I dead, too, then?"

"Your will is, Buddy?"

Then the linemen were face to face across the pole and a ghostly safety belt was crossed over the one of leather.

"Your hands look warm, but your touch is cold."

"It is only the wind, Buddy."

"I am afraid of you. Who are you?"

"I am the lineman's will to carry you. I'm with you always. Heat and hail mean nothing to you and me—we are linemen. People don't know."

"The job is done."

"It wasn't so tough, was it, Buddy? Now—what are we?"

"We are friends."

"And—"

"We are linemen!"

As the man wended his way down the snow-drifted hill, he seemed to awake from a daze and his heart sang a lilting tune of purloined notes, gathered from the deepest well of his being. An inward prompting urged him to look back to the job he had done, to the place where he had carried on. The place where he had found himself, the place where he had proved himself a lineman.

As he peered back through the swirling scud, he thought he saw a slit of light widen to an oblong radiance, then fade to a slit again. He blinked and could not be sure, then when he looked again he saw nothing of the light and he paid no heed to the little lump that came in his throat only to melt again.

Service Suggestions
NATIONAL ELECTRIC LIGHT ASSOCIATION — COMMERCIAL NATIONAL SECTION
CUSTOMER RELATIONS COMMITTEE
H. T. EAST, *Chairman*, Public Service Co. of Northern Illinois, Chicago, Ill.
To formulate efficient methods of conducting relations between the customer, the public and the supply company, including such matters as taking applications in the office, forms, order routing, inquiries, complaints, meter reading, collections and credits

No. 70 April, 1929

Employee and Consumer

By Customer Relations Committee

Pacific Coast Electrical Association

THE attitude of the individual employee is the greatest single factor in customer relationship. If all employees thoroughly understood their functions and had a proper conception of their obligation to handle each direct or indirect customer contact with efficiency, courtesy, tact and sympathy, good-will would be assured.

To reach this Utopian state, the personnel must be carefully selected, properly trained, and then imbued with the proper spirit. This is no easy task. Because of its admitted importance, the subject is receiving widespread attention in the public utility industry. Many plans are being followed in the effort to obtain the desired result.

Pacific Coast companies last year held an essay contest which did much to gain the interest of their employees, induced them to study the problem and, incidentally, brought them to realize their importance in their respective organizations. The results were eminently satisfactory. Informative material was distributed as a guide and essays were prepared. Prizes were awarded the best papers. The story is reprinted below together with illustrations of the booklet containing the contest rules. The material is excellent, containing many ideas which can be used by other companies who seek to improve customer relations through employee cooperation.

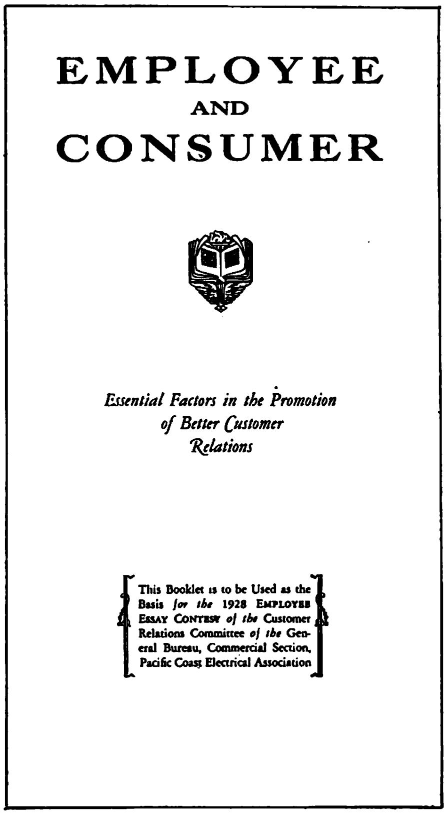
A GUIDE TO
How Can I Best Serve My Company and Its Customers

Your Responsibility

Did you ever realize that what a consumer thinks of you is often what he thinks of this Company? Did it ever occur to you that thousands of this company's consumers have never met more than one or two of our employees? Is not their opinion of our company almost certain to be based on the treatment you have given them?

It follows then, that *you are the company* to the most of the people who patronize us. If you have been courteous, performed your work intelligently, answered questions patiently and have given the treatment you would like to get yourself, then that consumer will form an opinion of our organization that will be a credit to you and to us. If, on the other hand, you have not conducted yourself in quite the proper manner, the impression left with that person is one of antagonism, or at least dislike, which may take years to overcome. Indeed it may never be entirely corrected.

This company is selling a service; not something to be bought by the pound. It is a service that is necessary to the life, health and business of our community; almost as essential as the air we breathe. If we fail in our daily duties and our service ceases, our fellow citizens have nowhere else to turn; they are dependent upon us for something that is vital to their existence. We all of us have, then, in addition to our daily work, a responsibility to our community; the responsibility of furnishing a service which is a necessity of life. Our consumers demand, and rightly so, that this service be rendered courteously, and in a way that will cause the least inconvenience to them. If they receive this kind of service they will be our friends, and our list of friends is the biggest asset of this company.



EMPLOYEE
AND
CONSUMER

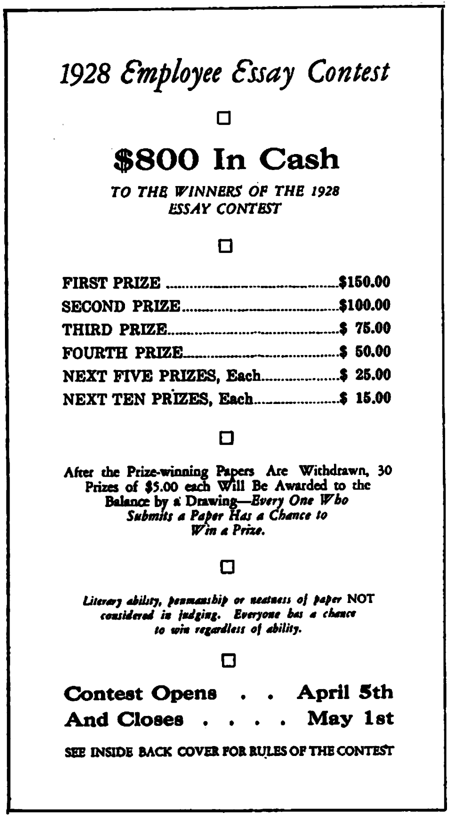
Essential Factors in the Promotion of Better Customer Relations

[This Booklet is to be Used as the Basis *for the* 1928 Employee Essay Contest *of the* Customer Relations Committee *of the* General Bureau, Commercial Section, Pacific Coast Electrical Association]

Cover of booklet
Actual size is 4¼ by 7⅜ inches.

We are striving constantly to improve the quality of our service but we must depend upon you to give it. The largest part of the responsibility of this service rests with *you*. As it depends so greatly on you to see that our customers receive what we are trying to give them, it is natural that we should watch your treatment of them. We have found that people are quick to appreciate earnest efforts in their behalf, and we wish to recognize those of you who put forth these efforts. Need it be said that advancement and promotion will come more quickly to those of you who have made a record of honest endeavor to give service to our customers?

We recognize that mistakes are often committed unknowingly. We are, therefore, giving you a few instructions so



1928 *Employee Essay Contest*

that you may know exactly how we want you to treat our customers. It is the little things in life that count, and it is the little acts of courtesy and the little efforts toward service which will be remembered by our customers, for they mean so much to them. These instructions refer entirely to how your work should be carried on, and not to the details of the work itself. Routine may change from day to day, but its object will always be more and better service, given with a maximum of courtesy. A thorough understanding of the spirit of these instructions will be invaluable to you in your work. It can always be followed no matter where you are in our organization.

To ignore the instructions that we are giving may be the cause of making enemies for us. To follow them will assist us in giving the service we desire and will build up a record for yourself that will be of great assistance to you in the advancement for which we are sure you are striving. We are offering these instructions to help you make yourself better in your work. If we succeed in that, our company will benefit, and we do not need to emphasize that your prosperity depends upon the success of the company for which you work.

General Instructions

On the following pages you will find instructions to different classes of employees in our company. These have been prepared to guide you in your daily contact with the public. We desire that all employees read all of the instructions contained herein, paying special attention to the ones given under your particular classification.

It should be noted, however, that there are employees in our company whose work does not come under any of these classifications, but who, nevertheless, are in touch daily with some of our customers, perhaps at home or at social gatherings. In the instructions which follow, such employees will find the suggestions which will fit their case and which will be easily recognized by them.

If any doubt arises in your mind as to the particular instructions which apply to your class of work, the head of your department will be glad to discuss them with you.

Courtesy to Your Fellow Employees

Be courteous to your fellow employees. Your first thought will be the question: "What has this to do with the public?" The connection is indirect but very apparent. When you have been treated discourteously by a fellow employee you feel it and are very apt to show it in your manner. If the next person with whom you deal is a consumer, you will probably be a little less considerate toward him even though you may be unconscious of any change in your manner. Courtesy between employees will secure more polite treatment by all of us to our customers.

Apart from this personal side, mutual courtesy will create a feeling of fellowship and friendliness throughout our organization which will make our work more pleasant for all of us. The effect of this spirit cannot help but secure more considerate attention to our consumers.

Co-Operation Between Departments

Quite often in the course of your duties, it may be necessary for you to work with other departments of our organization. When this occurs, approach that department in the spirit of co-operation rather than that of shifting responsibility.

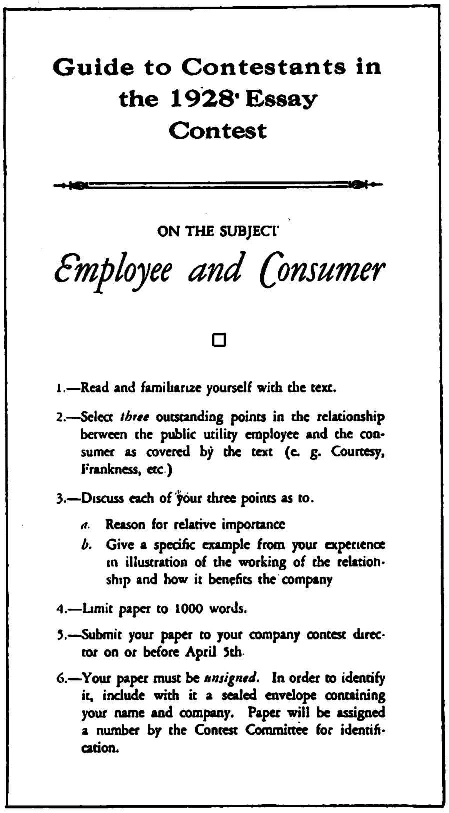
By working in harmony, friction is eliminated and the work is accomplished in less time, with much better satisfaction to the consumer and at smaller cost to the company.

Should an error, made by another department or by a fellow employee be brought to your notice, do not feel, since it is not your mistake, that you have no responsibility in the matter. Correct it if possible, and if you cannot, call it to the attention of some one who can.

An error, however small, if not discovered and corrected at once, may cause needless inconvenience to the consumer and expense and trouble to the company.

Outside Criticism

Never criticise another department or employee of our company when talking to a consumer. If you cannot make a clear explanation of the subject under discussion, simply state that you will have it investigated. Criticism of your organization or any part of it to outsiders shows your lack of confidence in it. Consumers will not have confidence in your statements or judgment if you show that you have none in your fellow employees. When you make such statements you destroy confidence in yourself as well as in our company. You have hurt yourself and have not helped the consumer. Nothing will so quickly destroy our confidence in you as to learn that you criticise our company or your fellow employees when in conversation with our consumers.



Guide to Contestants in the 1928 Essay Contest

ON THE SUBJECT

Employee and Consumer

* * *

1.—Read and familiarize yourself with the text.

2.—Select *three* outstanding points in the relationship between the public utility employee and the consumer as covered by the text (e. g. Courtesy, Frankness, etc.)

3.—Discuss each of your three points as to.

- *a.* Reason for relative importance
- *b.* Give a specific example from your experience in illustration of the working of the relationship and how it benefits the company

4.—Limit paper to 1000 words.

5.—Submit your paper to your company contest director on or before April 5th

6.—Your paper must be *unsigned.* In order to identify it, include with it a sealed envelope containing your name and company. Paper will be assigned a number by the Contest Committee for identification.

Reproduction of inside back cover of booklet

Report Complaints

If any complaint, misunderstanding, or case of poor service on the part of our company comes to your attention outside of your regular work, report it promptly to the department concerned. This will allow us to give much quicker attention to the trouble than might be the case if you did not report it, and it also will be valuable in that the customer will appreciate your interest in him, and will more readily believe that we wish to give him the best possible service.

Rates, Rules and Regulations

Do not attempt to explain rates, rules and regulations to consumers unless you are sure you thoroughly understand them. If you are at all in doubt about the question, refer it to the proper department. There are many mistaken ideas among our consumers about the manner in which our company must operate. You will be doing any consumer a favor and making friends for the company when you assist in clearing up any misunderstanding, either by giving the proper explanation yourself or by referring the matter to the one who can do so.

Service Before Routine

Do not allow yourself to become a slave to routine. While it is necessary that this company work by certain standard rules, yet our first desire always is to render service to the consumer in the best possible manner. To do this it is often necessary for you to depart from our regular procedure, and at times to request the assistance of other employees and departments in order to accomplish the desired results. If you have not the authority to do what seems necessary, consult the head of your department. Your efforts in this respect to assist us in serving the consumer will be very pleasing to us and will work to your advantage.

Proper Use of Telephone

The proper use of the telephone by all employees is one of the most important phases of our company's business. The customer cannot see you and must judge you solely by what he hears and how he hears it. To create a pleasing impression by telephone is not always easy, and the endeavor to do so calls for your best efforts.

Answer your telephone promptly.

Never say "Hello." Answer by giving your name and department. If the call is received directly from the outside without coming through a company switchboard, give the name of the company first, followed by your own name.

Give close attention. The party calling has the right to expect that you are listening to him. Don't force him to repeat due to your inattention.

Keep your mouth close to the telephone and talk in an ordinary tone of voice. Shouting will blur your speech and talking too low will make your words difficult to understand.

Use a pleasant tone. Your voice is your only means of impressing the consumer that you are at his service. Make it courteous.

Don't argue. You are justified in making statements of facts as near as you know them, but don't argue about them. You may be wrong and you weaken yourself and your company by being drawn into an argument.

Let the consumer close the conversation. Don't run the risk of hanging up before he is through.

Say "Thank you" when possible in closing a telephone conversation. This is proper in many more instances than might appear at first thought. For example, it is right that we should thank any customer for calling in regard to a complaint, for we appreciate information as to laxity in our service and we welcome every opportunity to clear up a misunderstanding of any kind with a consumer.

If a person called is not available, be sure that the name and telephone number of the party calling are transmitted to him as soon as possible. Assure the consumer that you will give his call to the person to whom he wishes to speak.

If, by chance, you have been called by mistake and are not the one with whom the consumer wishes to talk, be especially courteous and use your best efforts to get the right one in our organization for him. It was probably not the error of the party calling and your effort to accommodate will be appreciated.

When desired information cannot be given without undue delay, request the name and telephone number of the consumer and say you will call as soon as possible. *Don't fail to keep your promise.*

Above all, be courteous in tone and words; *the consumer can only "see" your voice.*

Salesmen

A neat personal appearance is more essential to the salesman than to almost any other class of employee. First impressions are the most lasting and an untidy appearance will create an unfavorable opinion of you and your company.

Make a practice of shaving daily. Keep your shoes shined and your clothes cleaned and pressed. Clean linen is inexpensive and essential. Be careful of the appearance of your finger nails. Watch these details and avoid any chance of personal criticism.

Avoid the use of tobacco while conversing with others. It may be offensive to them.

If you are a power salesman you must be thoroughly familiar with your company's rates and regulations. If you are selling appliances you must know your merchandise. Such knowledge is absolutely essential if you are to create a feeling of confidence in your prospective customer.

Keep in mind that your prospective customer knows his own business better than you do. He may even know more about the application of your commodity to his business than you do. Go carefully until you know your ground. Show every consideration to his opinions.

Do not make promises unless you know they can be fulfilled.

By many of the people with whom you come in contact you are looked upon as being an authority on company matters. It is therefore essential that you keep fully informed in regard to the operations and general policies of the company. You must use great care in making statements and promises. If you are asked a question and are in doubt as to a correct answer, do not guess. Tell your customer you will obtain the requested information for him. Take no chances on an incorrect or ambiguous reply. It may cause serious trouble for your company and the consumer.

You will often be required to listen to complaints concerning some part of our company business. Give such matters your full attention and refer them to the proper department. We consider such work just as essential to your success as obtaining the new business.

You have an exceptional opportunity in your work to build up good will for your company. Your word is accepted as authority on company business. Use all care that you do not put yourself and the company in an embarrassing position by giving information carelessly, or inaccurately. This will destroy confidence in you and in us.

To a salesman it should not be necessary to speak of courtesy. To be successful you must have it in a certain measure. But we also ask you to give "consideration" to the people with whom you come in contact. It is the highest type of courtesy. Be considerate of their opinions, their circumstances in life, their surroundings. You must avoid the "know it all" attitude. Regardless of what you are doing, it will make friends for you and for us.

Applications and Contracts

In the majority of cases you are the first of our employees with whom our consumers come in contact. The impression made by you at this initial meeting will, to a large extent, determine their idea of this company. First impressions are always most lasting and it is with this in mind that we urge upon you the importance of using every effort to correctly carry out your duties with proper courtesy and consideration to our consumers.

Special attention should be given to your personal appearance. Clean linen and well kept hands are essential.

A thorough knowledge of our rates and regulations is absolutely necessary. Take time to make a full explanation to the consumer of the particular condition applying to his installation. Be most particular in obtaining correct names and addresses from the consumers. Misspelled names may mean a delayed bill and wrong addresses are almost certain to cause a delay in service to the consumer as well as any amount of extra labor and trouble in other departments of the company. You cannot use too much care in this part of your work.

Make your explanations in simple terms. Remember that your everyday "working" language is as so much Greek to the majority of consumers. Talk to them in terms that will be plain to them and don't resort to the routine language of the office.

Be sure that you understand exactly the class of service desired by the consumer and that the correct rates are applied. It is often necessary to question the consumer to a certain extent before you will be certain as to what class of service is desired. Guard against appearing impertinent or inquisitive.

Be careful about giving figures as to monthly cost of service. Consumers often request information as to what their bills will be, and they are quick to take any statement of ours as a promise on our part. Avoid this. If necessary, do not hesitate to refer them to the department which can go into the matter more fully.

Do not make ambiguous statements. They oftentimes cause us a great deal of trouble. Leave no room for doubt in the consumer's mind in regard to any part of your conversation.

Avoid the use of the phrase "You will have to." There are many other ways of telling the consumer that it is necessary for him to do certain things to conform to our regulations. None of us like to be told that we "have to" do anything.

In the case of a public utility particularly, people resent this phrase.

Be interested in the consumers. Make them feel that you have a personal interest in their affairs as far as our company is concerned. They are almost wholly ignorant of our business and a personal interest displayed by you will cause them to feel we are anxious to assist them. Remember that each consumer at the counter is a human being like yourself.

And last, and most important of your duties, is courtesy, always and never failing. It is most productive of success in your work and at times it will be most difficult to achieve. You will have those to contend with that will try your patience until courtesy seems almost impossible. But courtesy on your part will keep you in command of the situation and can never bring criticism upon you. It is your best weapon against the "hard to handle" customer, and your characteristic which will be longest remembered by all of them.

Requests for Information

These may come to you no matter what position you may hold in our organization and it is needless to point out the importance of the replies you give. It is essential that they be correct, and if in any doubt, be sure you obtain the proper information for the consumer.

If you are a telephone operator or information clerk it is your duty to be thoroughly familiar with the work of the various departments and the men in those departments who meet the consumers. Use great care to see that the consumers are directed to the proper person in our organization. It is very annoying for them to repeat their story several times to different people before they reach the right one.

It will often be necessary to question the consumers considerably in order to know where to direct them. This must be done tactfully and courteously. Remember that they probably know nothing of our organization and have little idea of how our work is conducted. Do not become impatient if they do not seem to know just what they want. Our business is a mystery to the most of them.

Cashiers

The payment of any bill is not particularly agreeable to anyone; make the payment of bills for our service as pleasant as possible. Be neat in your personal appearance. Greet each customer with a smile, a pleasant greeting, and a "Thank you" when he leaves. Do not turn away from a customer until he starts to leave.

Do not argue regarding a bill. If you cannot explain the account to the consumer's satisfaction, refer him courteously to the person whose duty it is to investigate such matters.

Make change promptly and carefully.

When currency, from which change is required, is given in payment, leave the currency in sight of the consumer until the change is counted and accepted. You will thus avoid any argument as to the amount of currency given you.

Do not carry on unnecessary conversation while other consumers are waiting.

Do not leave your desk during rest periods unless someone is at hand to relieve you.

Complaints

In interviewing consumers who have complaints, you have one of the most difficult and important duties of any in our organization. Bear in mind that in the majority of cases the consumer is sincere and is convinced that his grievance is legitimate.

Consider that this consumer is entitled to your full attention while you are interviewing him. Endeavor to make him feel that you are taking a personal interest in his case and will see that he gets everything to which he is entitled. To do this successfully you must be sincere in your manner and thorough in looking into the grievance. Don't neglect anything which may have a bearing on the case. It may cause a worse complaint later.

Give those complaints which come in over the telephone the same thought and attention as those reported in person by the consumer.

Be courteous—never risk embarrassing yourself or the company by arguing or insisting that the consumer is at fault. Many times he is not.

Investigate each complaint thoroughly and follow it up until it has been attended to, with the idea always in mind that any trouble that may exist should be corrected as soon as possible.

Do not make promises unless you know without doubt that they can be fulfilled.

Remember that the consumer is not as familiar with our service as you are, and do not confuse him with technical terms. Use simple language in your own explanations. He will appreciate your courtesy in not confusing him with unfamiliar words.

Accounting Department Employees

Although your work does not often bring you in personal contact with the public, yet the quality of your work has an important bearing upon our relations with our customers.

An error in computation leads to a complaint which always takes time and effort of other employees to correct.

But the worst result of an error is the impression left with the consumer that he "caught" us in a mistake.

Make plain figures. Illegible figures lead to mistakes by other employees. When appearing on a bill, they exasperate a customer.

Collectors

Collectors have one of the most difficult jobs in our organization. No one likes to be dunned even though they know the bill is just. To keep the right balance between collections and satisfied consumers is no easy task.

Do not allow yourself to depend wholly upon the "money or meter" policy. While in some cases it is necessary for us to remove a meter for non-payment of account, yet when that meter is out we are earning no money at that address. Removal of the meter should be the last resort.

You will be judged by the skill you show in obtaining payments and terms for settlement without resorting to meter removal. Many delinquent accounts will show possibilities of settlement within our rules, if they are examined with tact, courtesy and a little human kindness. In cases of dispute, don't argue. Verify your facts. The apparent delinquency may have been the result of our mistake.

Be neat in your personal appearance.

Above all, be courteous and polite in all cases. Allow no provocation on the part of the consumer to cause you to forget your dignity and that of the company you represent.

Setting and Removing Meters

Be clean. Self-respect is largely a matter of personal appearance, and you cannot expect the people with whom you come in contact to have respect for you unless you show respect for yourself. Just because you wear working clothes is no reason why you should not shave regularly and keep your hair combed.

Be courteous. Answer questions courteously, even foolish ones. Remember that your work, which appears simple to you, is more or less a mystery to the average man or woman. If the consumer desires to be shown how the meter is read, a short, simple explanation does not take long, and will usually convince the consumer that there is no magic, or what is more important, no guess work about it.

In a great many cases you are the first representative of the company with whom the customer comes in contact, and it is essential that you make a good impression. On entering the porch or house of a consumer, wipe your feet, remove your hat, and while doing your work try to make as little dirt, noise or fuss as possible.

Insofar as the company rules permit, you should check over the consumers' appliances before turning on the service, to make sure that our meter and service are of sufficient size. If there appears to be trouble when the service is turned on, do not condemn the man who made the installation, but look around for the defective device which often is the cause of the trouble.

If you cannot set the meter due to some defect in the job or to some infraction of a rule, such as wrong type of meter box, doors too small, etc., be sure the consumer understands the cause of the delay. Don't say "It's the company rule" and let it go at that, but try to explain the matter from the standpoint of safety or convenience to the consumer.

Leave the consumer's premises in as neat a condition as you found them. Don't walk over lawn or flower beds, and when you enter or leave the yard close the gate after you. These may seem to you to be small details but they mean a great deal to the average housekeeper.

Familiarize yourself with the company

rules which apply to your work and if there is any doubt in your mind as to the proper interpretation of any point, consult the head of your department as to the correct meaning of the point in doubt.

If in some respect the information on your work orders does not agree with what the consumer has in mind, do not try to place the blame on anyone. Explain the discrepancy the best you can without criticism, and clear up the matter when you get back to headquarters. If mistakes in other departments cause you trouble, report them to your superior. Do not tell your troubles to the consumer. Read the paragraph on "Outside Criticism" under "General Instructions."

Meter Readers

Be clean. Shave regularly, and if you wear a white collar, be sure that it is clean; a clean soft shirt collar looks a great deal better than a dirty white one.

Be courteous. Remember that the meter reader is almost the only representative of the company with whom the consumer comes in contact after the original installation is made. Every word you say, every move you make, and particularly your appearance will be a contributing factor in forming the consumer's opinion of, and attitude toward the company.

Don't jump fences or walk on lawns or flower beds. If the meter is in a locked porch or other enclosure, and there is nobody at home, do not force an entrance. Treat the consumers' premises as you would want your own place to be treated.

Be accurate. Remember that bills are made out from your readings and a mistake on your part usually causes a great deal of troble.

Trouble Shooting

You have an exceptional opportunity in this work to make friends for our company and leave behind you a record of courtesy and helpfulness which will be of great assistance to us and to yourself. Every call you make is the result of some trouble or inconvenience to the consumer. He is looking to you for help and when you give him assistance in a polite and courteous manner you leave behind a friend to you and to our company.

On arriving at a house in the daytime go to the rear door; if at night call at the front door to avoid frightening anyone who might be timid.

State your errand briefly and if your company credentials are requested, produce them promptly and pleasantly.

Be sure that you remove your hat upon entering the house. See that your shoes are clean.

If necessary to stand on a chair, ask for a kitchen chair and see that the seat is properly protected by paper or otherwise.

Be sure that any dirt you may have made is cleaned up before you leave.

If the cause of the trouble is not immediately apparent, take sufficient time to locate it and be sure the consumer is satisfied before you leave.

If you are unable to make a permanent repair at the time, see that the proper notation is made on the trouble tag in order that it may be followed up by the right department.

If the trouble requires work for which the company makes a charge or which should be handled by an outside contractor, explain this to the consumer so that it is clearly understood.

If you see any fault or defect in our own system be sure that it is noted and turned in on your report so that it may be corrected by the proper department.

Do not make promises unless you know that they can be fulfilled.

Answer questions asked by the consumer to the best of your ability. Many of them may seem foolish to *you*. But remember that your business is a mystery to most people and a courteous reply will be appreciated by them.

If they desire information which should be given by other departments, put the proper notation on your report so that it may be followed up.

Insofar as your work will permit, keep up your personal appearance. Neatness and cleanliness will go far toward making a good impression on the consumer for the company and yourself.

SERVICE SUGGESTIONS PROVE USEFUL

Several member companies have purchased additional copies of Service Suggestion No. 64 "Tree Trimming from the Public's Viewpoint," and placed them in the hands of each line foreman. Reports received indicate that material improvement was thereafter noted in the line crews tree trimming work and attitude toward property owners' rights.

One company states that copies of Service Suggestion No. 65 "The Telephone as a Service Medium," were distributed to all employes who handle customer calls and that immediate improvement was apparent in the company's telephone contacts.

These reports prove that effective use can be made of additional copies of Service Suggestions and it is the committee's hope that member companies will order additional copies in loose leaf form for distribution to superintendents, managers, department heads, and employes. The real value of the ideas which these articles contain lies in the use made of them.

Orders for additional copies of any issue or standing orders for a number of copies each month may be placed with the chairman. The charge is 5c. per copy. (H. T. EAST, *Chairman*, 1427 Edison Building, Chicago.)

Construction Crews

Normally your work does not bring you in personal contact with many of our consumers. But do not think they do not see you. The public loves to watch a crew of workmen and they are quick to judge a company by the way its men carry out their duties.

You do not have time to carry on conversations with the public, but you will be asked questions now and then. We must leave it to you to know how much time to give to such questions, but we expect you always to be courteous. Rudeness is never called for and is inexcusable.

In working on or near private property, be considerate of the owner. Use the same care with his lawn, fences, flower beds, etc., as you would like to have shown to your own property. There is no excuse for unnecessary damage and we will not tolerate it.

Truck and Automobile Driving

Your car or truck is plainly marked with our company name. You are our representative and we are judged by your actions.

Know the traffic rules thoroughly. Drive carefully. There will be no excuse for breaking the law's requirements.

In heavy traffic don't crowd other cars. Don't be a "road hog." Extend the courtesy of the road at all times.

The public service license on your car does not give you the special privileges of fire apparatus and ambulance. So watch your speed.

Remember that the conduct of automobile drivers is always subject to special attention on the part of the public. Any discourtesy of yours is a reflection on your company.

In Conclusion

When you have read the foregoing instructions carefully, you will, no doubt, have seen that they could have been condensed into one short sentence, one which we have all known for many years, "The Golden Rule." But we have interpreted this rule for you at some length so that you might know exactly what would be expected of you. In this way there will be no misunderstanding by any of us.

As we stated in the beginning, we are selling a service to the public and we desire and insist that this service be rendered with the maximum of speed and courtesy. In no other way can we justify our company's existence. That is the purpose for which we are in business. It is the only way in which we can succeed.

You are looking for advancement and success. In a large measure this depends upon the success of this company, which in turn to a great extent rests with you and depends upon the manner in which you carry on your work.

We have endeavored to blaze the trail to guide you on your way. We know you will not fail in an honest endeavor to follow it.

INTERPRETATIONS of ELECTRICAL DEVELOPMENT

By Statistical Research Department, N.E.L.A.

H. A. Snow, *Chairman, Statistical Committee, Accounting National Section*
H. S. Bennion, *Director of Engineering, N. E. L. A.*
Wm. M. Carpenter, *Research Statistician*
Merle Rainey, *Assistant Statistician*

The Statistical Research Department of the National Electric Light Association will issue monthly, in this section, basic statistical information on the electric light and power industry.

The Department regularly receives comprehensive annual and monthly reports from the larger member companies of the Association, whose total business represents 80 per cent of that of all electric light and power enterprises in the United States. In addition, the Department consults and cooperates with other sources of information.

Member companies are invited to make the fullest use of the statistical bulletins of this Department, published separately, as well as of the current statistical information in the N.E.L.A. BULLETIN, and to more fully utilize the services of the Department.

Current Statistics of the Electric Light and Power Industry

The data here presented are for the total (100 per cent) electric light and power industry and are based on monthly reports received from some 400 companies, representing over 80 per cent of the industry.

Preliminary Figures for the Year 1928

THE summarization of the individual months of 1928 enables us at this time to arrive at preliminary figures for several of the more important statistics of the year's operations and to make a comparison with similar items in previous periods.

While the continued expansion of facilities and the further diffusion of service to all classes of consumers was a feature of public utility operation in 1928, an analysis of these trends discloses some interesting facts. The actual generation of energy by the electric light and power industry itself increased during 1928 by 7,545,000,000 kwhrs. (or by 10.1 per cent) over the generation during 1927, as compared with an increase of 6,560,000,000 kwhrs. (or by 9.7 per cent) in 1927 over 1926. Some qualifications must, however, be immediately made in this comparison. February had one more day in 1928 (which accounted for 220,000,000 kwhrs.) and some of the gain was at the expense of power imported from Canada and purchased from enterprises not public utilities. Eliminating the extra day, the net gain in the grand total of electricity, generated and purchased by the electric light and power enterprises of the United States during 1928, was 6,973,000,000 kwhrs. (or of 9.1 per cent) over 1927. This compares with corresponding figures of 7,573,000,000 kwhrs. (or of 10.9 per cent) in 1927 over 1926 and with approximately 8,200,000,000 kwhrs. (or 13 per cent) in 1926 over 1925. These comparisons again emphasize the importance of the fluctuations of the activity of industry and trade in the fortunes of the electric light and power business.

The number of new customers added to the lines of the various electrical enterprises during 1928 was 1,371,000, as compared with a net addition of 1,566,000 during 1927 and of 1,654,000 during 1926. The progressive decrease in the addition of new consumers may probably be explained by the facts that practically every community with a population of more than 1000 people now enjoys the benefits of electric service, that the number of unwired houses in the older cities and towns has rapidly diminished and that the decline in residential construction (which began early in 1928 and is proceeding with increasing severity up to the present date) has begun to make itself felt. A very hopeful sign, however, is found in the steady increase in the annual use of electricity by the average domestic consumer, which is accompanied (and, perhaps, to a large extent caused) by a corresponding decline in the average cost of electricity. This gain of 27 kwhrs. per year (or 2¼ kwhr. per month) per consumer compares with a gain of 25 kwhrs. per year during 1927 and the further possibilities which the continued stimulation of this market holds in the increase in the comfort and convenience of the home are very evident.

These figures are, of course, tentative and will probably be subject to minor revisions when the complete report, assembled from the annual statistics returned by the industry, is finally compiled.

Basic Information on the Electric Light and Power Industry

As of December 31, 1928

The data included in this table are the basic factors of the electric light and power industry and will be brought up-to-date at the end of each month and published in each issue of the BULLETIN.

1.	Value of plant and equipment (estimated)	$10,000,000,000
2.	Total generating capacity in kw	27,310,400
	Steam	19,585,400
	Waterpower	7,429,100
	Internal combustion	295,900
3.	Total number of customers served	23,270,400
	Farm customers	†135,000
	Domestic customers	18,937,700
	Commercial customers	4,173,600
4.	Population in electrically lighted homes (Electrical World)	81,500,000
5.	Percentage of homes which are served with electricity	66
6.	Miles of transmission lines (11,000 volts and above) (1927) (circuit miles)	132,000

---

†As reported by some 120 companies only.

Number of Homes Served with Electricity by the Electric Light and Power Industry *

(As determined from N. E. L. A. monthly reports received from some 400 companies and prorated to the total in each State)

	Total Number of All Homes	Number of Homes Receiving Electric Service On Dec. 31, 1927	Number of Homes Receiving Electric Service On Dec. 31, 1928	Homes Wired During 1928	Per Cent of Homes Served on Dec. 31, 1928
Alabama	575,000	134,000	148,000	14,000	26
Arizona	118,000	36,000	38,000	2,000	32
Arkansas	455,000	107,000	115,000	8,000	25
California	1,220,000	1,303,000	1,374,000	71,000	(a)
Colorado	268,000	169,000	175,000	6,000	66
Connecticut	392,000	326,000	343,000	17,000	88
Delaware	61,000	29,000	32,000	3,000	52
District of Columbia	127,000	109,000	119,000	10,000	94
Florida	358,000	202,000	201,000	1,000	56
Georgia	715,000	136,000	148,000	12,000	21
Idaho	131,000	63,000	70,000	7,000	54
Illinois	1,816,000	1,471,000	1,524,000	53,000	85
Indiana	819,000	516,000	529,000	13,000	65
Iowa	608,000	328,000	342,000	14,000	56
Kansas	471,000	275,000	286,000	11,000	60
Kentucky	596,000	181,000	196,000	15,000	33
Louisiana	435,000	110,000	116,000	6,000	27
Maine	200,000	130,000	134,000	4,000	67
Maryland	378,000	236,000	255,000	19,000	67
Massachusetts	1,004,000	851,000	896,000	45,000	90
Michigan	1,106,000	857,000	921,000	64,000	84
Minnesota	623,000	385,000	398,000	13,000	64
Mississippi	417,000	52,000	62,000	10,000	15
Missouri	885,000	542,000	571,000	29,000	64
Montana	148,000	67,000	70,000	3,000	47

New Hampshire	114,000	90,000	113,000	23,000	99
New Jersey	897,000	790,000	859,000	69,000	96
New Mexico	91,000	23,000	23,000	.....	25
New York	2,840,000	2,725,000	2,909,000	184,000	(a)
North Carolina	591,000	161,000	174,000	13,000	30
North Dakota	134,000	46,000	54,000	8,000	40
Ohio	1,720,000	1,228,000	1,312,000	84,000	76
Oklahoma	545,000	177,000	199,000	22,000	37
Oregon	227,000	173,000	191,000	18,000	83
Pennsylvania	2,300,000	1,461,000	1,614,000	153,000	70
Rhode Island	168,000	141,000	155,000	14,000	92
South Carolina	391,000	90,000	95,000	5,000	24
South Dakota	157,000	54,000	59,000	5,000	37
Tennessee	570,000	164,000	172,000	8,000	30
Texas	1,255,000	491,000	537,000	46,000	43
Utah	119,000	104,000	106,000	2,000	89
Vermont	86,000	60,000	65,000	5,000	75
Virginia	552,000	191,000	204,000	13,000	37
Washington	421,000	300,000	329,000	29,000	78
West Virginia	378,000	121,000	130,000	9,000	34
Wisconsin	691,000	444,000	471,000	27,000	68
Wyoming	64,000	29,000	30,000	1,000	47
Total United States	28,596,000	17,860,000	19,057,000	1,197,000	66

(a) Over 100 per cent. Due to either classification of meters or estimated population.

*Subject to change to agree with the final data when summarized and issued by the United States Bureau of Census.

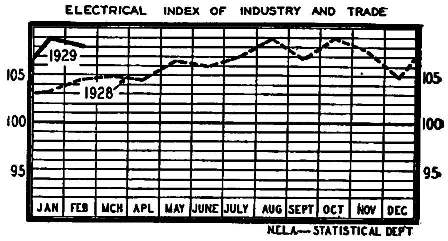
N. E. L. A. Index of Industry and Trade

THE N. E. L. A. Index of Industry and Trade showed a slight drop in February, preliminary figures indicating a decrease of nearly 1 per cent over the high level of January but still 3.5 per cent over February of last year. Extraordinary industrial activity, as indicated by the production of electricity, is shown for the region east of the Mississippi and north of the Ohio and Potomac Rivers. The Index, month by month for the last two years, stands as follows:

Electrical Index of Industry and Trade

	1927	1928	1929
January	104.9	103.2	109.0
February	103.8	104.7	108.1*
March	106.9	105.0	
April	106.8	104.6	
May	106.3	106.6	
June	106.1	106.0	
July	104.8	107.1	
August	104.9	108.9	
September	104.8	106.8	
October	102.6	109.0	
November	102.9	107.8	
December	103.1	105.0	

*Subject to revision.



The N. E. L. A. Index of Industry and Trade is based upon the deviation of the total output of electricity by all agencies which contribute to the public supply plus imports from Canada, from a computed "normal" figure for each month, which "normal" is adjusted for the continued growth of the light and power industry and is further corrected for season variation.

Note on Adjoining Table of Homes Receiving Electric Service

DURING the year 1928 approximately 1,200,000 homes received the benefits of electric service for the first time. This brings the total number of homes served up to 19,057,000. In other words, two-thirds of all the homes in the United States are being served electrically. Since 1918, over 12,000,000 homes have been connected to the systems of the electric light and power companies.

The adjoining table shows the number of homes receiving electric service by States on Dec. 31, 1928, and also shows the increase in the number of wired homes during the past year.

These figures must be regarded as preliminary and subject to some revisions so as to tally with the forthcoming 1927 Census of the Electric Light and Power Industry.

Increase in Factory Power

AT the end of 1927, according to preliminary figures released by the United States Bureau of the Census, the average American wage earner in industry had at his disposal 4.67 horsepower, an increase of 0.41 horsepower (or nearly 10 per cent) over the 4.26 shown by the Census for 1925.

The Bureau of the Census reports a grand total of all machinery installed in the manufacturing establishments of the United States, as of Dec. 31, 1927, of 39,032,014 horsepower. This is an increase of 3,365,070 horsepower (or 9.1 per cent) over the figures of two years before. At the same time, the average number of wage earners during 1927 is given as 8,351,257, a decrease of 30,254 (or 0.4 per cent) from the average number employed in 1925, and of 425,379 from the figure reported for the 1923.

"This remarkable increase in the amount of machinery, which has placed at the elbow of the American working man more power than in any other country of the world," states the Statistical Research Department of the National Electric Light Association in an analysis of these figures, "seems to have been accompanied by a corresponding increase in production. If we accept the not-unreasonable rule that the 'value created by manufacture' must be corrected by the changes in the level of wholesale prices in order to give an accurate comparison between these two years, it becomes evident that actual output of goods has kept pace with the growth of productive capacity. This is most important, because, after all, production is accomplished not by the mere fact of installation of machinery, but by its actual operation, and the true measure of the successful application of power is not horsepower of machines but the sum total of goods finally turned out.

Rise in Copper Prices Affects Utilities

THE present level of copper prices has reached 24½c. per lb. as compared with the average of 14½c. per lb. prevailing from 1923 to the beginning of the recent rise. If the present price persists, the 1,000,000 tons of primary metal which the United States will probably produce during 1929 will cost the consuming public an additional amount of at least $200,000,000, according to the Statistical Research Department of the National Electric Light Association.

The public utilities of the United States, together with the manufacturers which make the appliances for electrical use, take one-half of all copper used in this country. In detail, this consumption of copper is roughly as follows:

	Per cent
Telephone and telegraph	11
Light and power lines	14
Electrical maanufacturers	23
Sundry allied lines	2
Total	50

The net consumption of the electric light and power industry (that is, total new construction less old copper taken down and recovered) is in excess of 100,000 tons per year. This is used in transmission lines, distributing systems, and wiring installations. An increase of ten cents per pound in the cost of electrolytic copper before fabrication over the average of the past five years means a rise of something over 12 cents per pound in the price of finished wire. This represents an added expense in the construction of new facilities of at least $25,000,000 per year.

Applied to farm electrification, it means an added cost of $40 to $67 for electrifying each new farm. With an average of three farms per mile, the total copper wire used is in the neighborhood of 1,000 lb. for light service and above 1,650 lb. for heavier service. At present prices, this means an increase in cost of $120 per mile—or $40 per farm—for light service, and of more than $200 per mile—or $67 per farm—for the heavier uses.

Applied to the telephone and telegraph industry, the increase in the cost of copper means about $20,000,000 added to the construction budgets of the year; to the electrical manufacturers it means nearly $50,000,000; to the automobile industry (which, including repairs and replacements, consumed about 100,000 tons last year) it means another $25,000,000.

Decisions on Questions of Interpretation of the Standard Classification of Accounts

By CLASSIFICATIONS OF ACCOUNTS COMMITTEE

THE Classification of Accounts Committee of the Accounting National Section stands ready to answer questions concerning the interpretation or application of the Standard Classification. The following questions have recently been considered and the answers represent the substantially unanimous opinion of the Committee for the current fiscal year.

Duplicate Interest on Refunding Bonds

Question.—A utility recently called for redemption three bond issues, one of which was an underlying issue, while the other two were high coupon rate issues, which it wished to get rid of. The issues were refinanced by bonds carrying lower coupon rates. Due to the fact that the new issue had to be provided and the money therefrom supplied for some time prior to actually taking up the bonds to be retired there was a substantial total of duplicate interest charges. How should this be accounted for?

Answer.—It is logical to consider the duplicate interest as a refinancing cost to be charged to suspense and amortized over the life of the new bonds.

NOTE: One member of the Committee expresses a somewhat different view, holding that on the facts as stated, the duplication interest should be charged direct to interest deductions for the period during which it accrued, but adds that further knowledge of the concrete situation might lead him to modify this opinion.

Cost of Cooling Tower, Pumps, and Coils Used in Connection with a Diesel Engine

Question.—In instances where a cooling tower, pumps, and coils are used in connection with the operation of a Diesel Engine should they be considered part of the engine with their costs chargeable to Account Number 325 "Internal Combustion Engines" or should the cost be charged to Account 327 "Miscellaneous Power Plant Equipment"?

Answer.—The cost of a cooling tower, pumps, and coils used in connection with a Diesel Engine should be charged to Account 325 *"Internal Combustion Engines."*

NOTE: One member of the Committee thinks Account Number 327 "Miscellaneous Power Plant Equipment," more appropriate.

Storage Battery Used in a Sub-station

Question.—Under Account Number 328 "Substation Equipment" it is stated "This account does not include storage batteries nor laboratory instruments and apparatus and other equipment coming within the scope of Account Number 344 "General Equipment." This company is installing one 125 Volt KFX-11 Exide storage battery at one of its sub-stations. It does not appear to be covered by the definition of Account 329 "Storage Battery Equipment" nor of Account 344 "General Equipment." Should it be charged to Account Number 328 "Sub-station Equipment."?

Answer.—Although the language of Account Number 328 *states that it does not include storage batteries, it is not the intention of the account to exclude therefrom small storage batteries such as might be used for working a switch or for some other purpose purely incidental to the operation of a sub-station. The wording of the account was undoubtedly meant to call attention to the fact that large storage batteries designed to carry temporarily the load on some outgoing circuit were provided for in Account Number* 329 *"Storage Battery Equipment." The type of storage battery described in the inquiry is neither "Storage Battery Equipment," coming within the definition of Account Number* 329, *nor "General Equipment" and its cost should unquestionably be charged to Account Number* 328 *"Sub-station Equipment."*

Miniature Control Switchboards

New Development in Electrical Control Reduces Switchboard Length in the Ratio of Ten to One

Article by a sub-group of the Generating Stations Subcommittee of the Electrical Apparatus Committee, Engineering National Section.

THE development of the miniature switchboard has been brought about by a demand for the concentration of the control of important and complicated electrical installations into the hands of one man, and also for the reduction to a minimum of the space required for the control equipment. Its popularity is rapidly increasing due to its decreased installation cost, its freedom of location, its economies in space and operation, and its adaptability to one man control.

The fundamental principle which has made the miniature switchboard possible is that of using relay switches or contactors, located close to the apparatus to be controlled, for handling the heavy currents which actuate the controlled devices, thus permitting the transmission from the control switchboard itself of only sufficient energy to operate or to initiate the operation of these relay switches. The adoption of this relay principle has made it possible to utilize much lower voltages and smaller currents at the control board, and hence to greatly reduce the size of the control equipment, of the control board itself, and of the interconnecting wires.

As a result of this arrangement, thousands of feet of conduit, and hundreds of thousands of feet of rubber covered control wire required by the conventional switchboard layout in a modern generating station are eliminated. In their stead a few multiconductor telephone cables, either of the ordinary type, or if considered necessary, of the special type used by steam railroads, are used to convey the miniature control currents to the relay switches. Both the first cost and the installation cost of such cables are very much less than for the corresponding rubber covered control cables and conduit required by the conventional type of installation.

Another important advantage resulting from the adoption of the miniature switchboard principle is that the location of the control board itself is not necessarily determined by that of the apparatus controlled. Such a switchboard may be placed almost anywhere, even in another building at some distance from the one housing the apparatus controlled, since the use of the telephone cables for the interconnection largely removes the limitations inherent in the use of the usual heavy control wiring. In fact by a suitable selection of instruments a miniature switchboard will function successfully, even over a distance of eight or ten miles.

In order to reduce to a minimum the size of the control switchboard, it was first necessary to omit all equipment not absolutely required, and then to reduce the size of what was left. For example, meters are not placed on miniature switchboards, unless it is essential that the chief operator be constantly apprised of their readings. Miniature control switches are used and even the indicating lamps are of telephone type.

The indicating lamps used for this service have been especially designed to have a longer life than the conventional telephone lamps, since, instead of being used intermittently as in telephone service, they are used for continuous indication. They are so designed that their brilliancy is not diminished until after a service of, say, eight months. They are interchangeable with standard telephone lamps, thus permitting the use of standard telephone lampholders.

The control switches, or keys, used on the miniature switchboard require a circuit of approximately 60 volts direct current, and as they have to handle only miniature currents, the relay switches which they control being designed to respond to miniature electrical impulses, they can be of minature size.

In cases where meters are required, miniature meters are available in the form of indicators actuated by telemetering devices installed at the apparatus controlled, the indications being transmitted to the miniature board over a few telephone wires.

Although miniature switchboards, together with their relaying devices and switching equipment mounted at a distance therefrom, are slightly more expensive in first cost than the conventional type of switchboard, this is more than offset by their decreased installation cost. In a recently built hydro-electric plant, for instance, a saving of $10,000 per generator was made by the adoption of the miniature switchboard arrangement.

The development of the falls of the Ohio River near Louisville permitted a trial of the miniature switchboard application to large hydro-electric generating stations. In this installation the oil circuit breakers are conveniently located between the generators and the busses, the disconnecting switches are located in immediate proximity to the oil circuit breakers, and the automatic relays, relay switches, and remaining switching equipment has been placed in "cubicles" located immediately adjacent

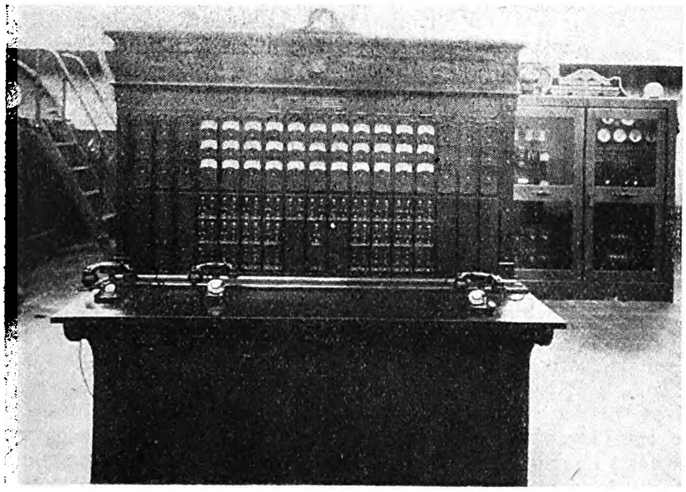

Fig. 1

Miniature control switchboard of Louisville Hydro-Electric Co. Front view

In the background appears one of the unit "cubicles" containing the relay switches, automatic relays, meters and auxiliary switching equipment.

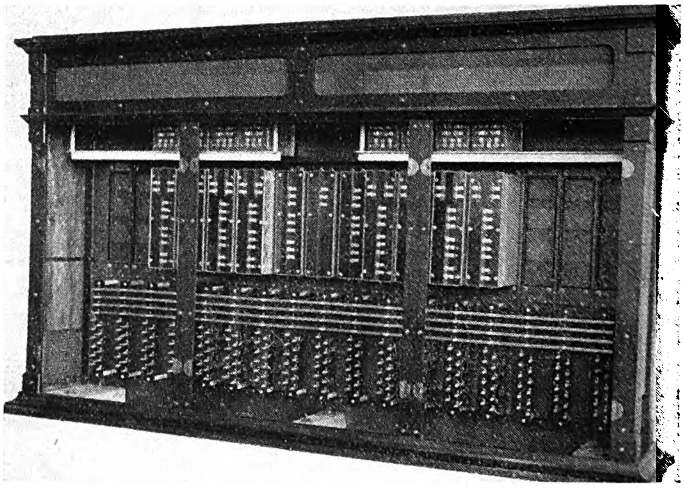

Fig. 2

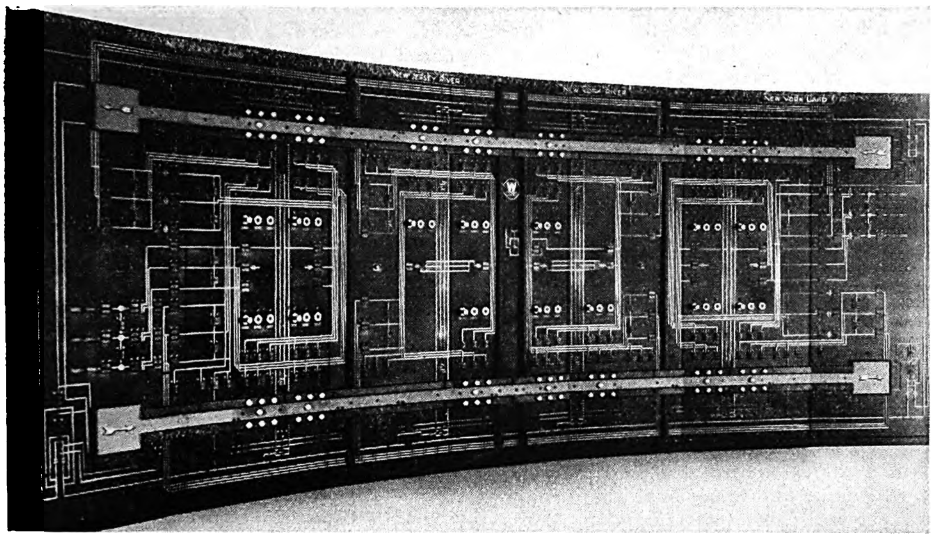

Fig. 3
Miniature control switchboard for Holland Vehicular Tunnel under Hudson River

to each generator. The telemeter indicators, control switches and indicating lamps are installed on a miniature switchboard, which has been placed in a central location on the main floor of the station. For this switchboard a panel width of three and one-half inches was adopted in contrast to the average panel width of twenty-four to twenty-eight inches in the conventional switchboard, thus reducing the total length of the board from about forty feet to five feet. A front view of the Louisville installation is shown in Fig. 1 and a back view, with doors removed, in Fig. 2.

The opening of the Holland Vehicular Tunnel, under the Hudson River, after seven years of construction work, having been hailed as one of the outstanding engineering achievements of the recent past, it is interesting to note that a miniature switchboard installation has been included as part of the safety measures taken in the design of this project. It requires no great effort of the imagination to picture what might happen if either the illuminating or ventilating system of this tunnel were to become inoperative during the period when traffic is heavy or, for that matter, at any time. What is undoubtedly the most elaborate system of ventilation of its kind has been installed to purify the air in the tunnel. Some idea of the magnitude of the ventilation scheme may be gained from the fact that eighty-four motor-driven fans are required supplying almost 4,000,000 cubic feet of air per minute. In addition, electrical energy must be supplied to a very complete system of signals and illumination.

In order to obtain the most intelligent as well as the safest operation of all this electrical equipment, it is essential that the control of every piece of apparatus be brought to one central point and be so arranged that one man can easily follow what is happening and control the equipment accordingly. For this purpose, the miniature central control or supervisory board shown in Fig. 3 has been installed.

This board is curved in such a manner that the operator can easily view any part while sitting at his desk in front of it. It will be noted that the board is divided into four sections corresponding to the natural divisions of the tunnel; the two large castings running horizontally correspond to the north and south tubes of the tunnel and the squares at the ends graphically represent the entrances or plazas.

The indicating apparatus on this board is very complete. The illumination of large lamps on the raised portion of the miniature tunnel indicate what sets of ventilating motors are taking care of various portions of the tunnel and other lamps indicate whether the respective motors are being operated from New York or New Jersey power houses. Carbon-monoxide recording apparatus has been installed in the tubes and will, in case of danger, give the necessary indication on the miniature switchboard. A number of small fire-alarm lamps are located in line with the carbon-monoxide-alarm lamps and are arranged to glow dimly at all times to indicate that the circuits are in operating condition but to become brightly illuminated at the position corresponding to any fire alarm turned in.

From the foregoing descriptions of the supervisory control board, it is seen that the operator can tell exactly how every piece of apparatus in this complex layout is performing. Here there are two tubes, each being more than 9000 ft.

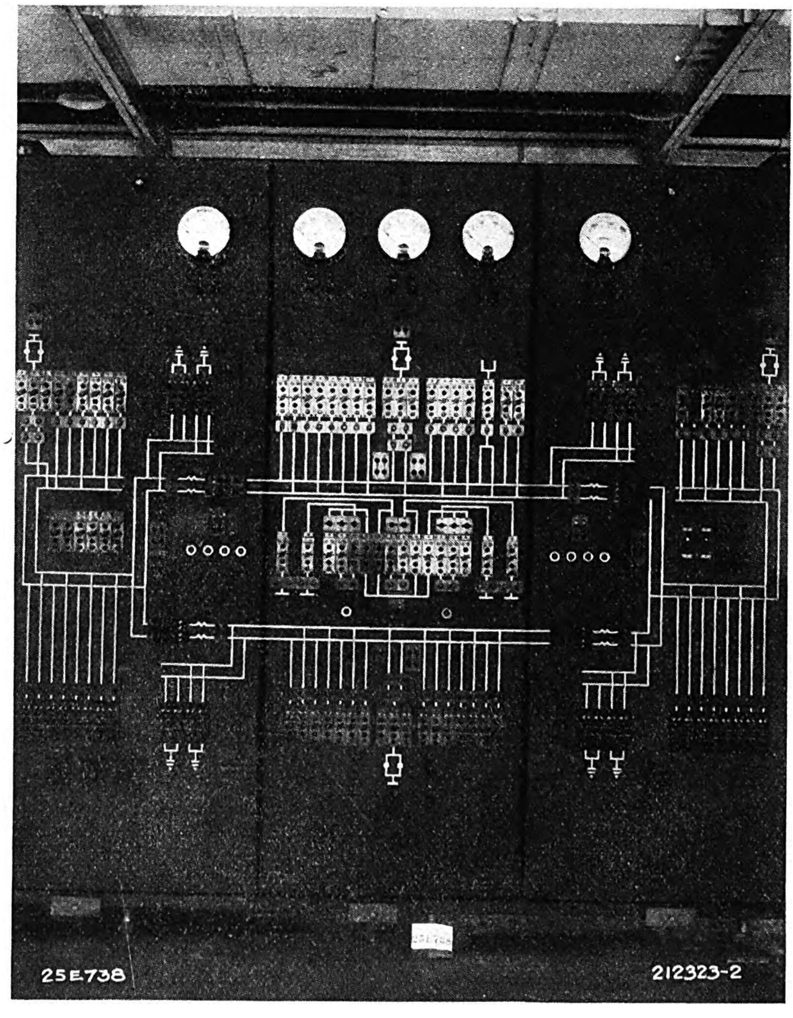

Fig. 4
A miniature control switchboard used in connection with a "Supervisory Control" system

in length and having electrical equipment at widely scattered locations, and still one operator has the control of all of it at his fingertips on a board which has a total length of only twenty-two feet.

The central control board in the Holland Tunnel has been referred to as the supervisory board. From a non-technical point of view, this term is surely correct since the operation of the entire system is supervised from this board. From an engineering point of view, the term "Supervisory Control" has come to mean one in which the control is transmitted through selective relay circuits rendering it unnecessary to have an independent circuit between each control switch and the apparatus controlled. Incidentally, although it is not generally referred to as such, the control board of a supervisory system undoubtedly represents one of the most miniature of switchboards. An installation of such a supervisory system is shown in Fig. 4.

In summation, it may be said that three different types of centralized control have been referred to above: one which is replacing the older "benchboard" type in the generating station; one which supervises such an electrical installation as that in the Holland Tunnel; and one which permits supervisory operation of the many units, or substations, of an electric distribution system. Each of these types brings to one point the supervision of an entire system or of a definite part of the system, together with all information required for correct supervision. The use of a miniature board at the central point reduces the space requirement to a minimum and makes it possible for one man to follow what is happening at all points and to operate the system accordingly. These advantages, in turn, make the miniature switchboard the most satisfactory, safest and most economical installation.

For many years there has been a trend toward greater and greater concentration of the control of electrical installations. Some fears were expressed in the early days as to the wisdom of concentrating the control for large power plants in a single room, or out of sight of the apparatus controlled, but with time and experience these fears have gradually been dissipated until today there is little hesitation in locating the control devices for any sort of an electrical installation at any convenient point which may be desirable, regardless of its location with respect to the controlled apparatus. This attitude has naturally resulted in a desire to reduce to a minimum, both the size and cost of the control apparatus itself and also of the connecting wiring between the control apparatus and the apparatus controlled. These ends have been accomplished by the development of the miniature control switchboard.

Transformers and Regulators

By Raymond Bailey

Chairman, Transformer and Regulator Group, Substations Subcommittee

THIS ARTICLE contains reports of the various studies and activities relating to transformers and regulators conducted by the Substations Subcommittee of the Electrical Apparatus Committee. A considerable number of studies are being made, results of which cannot be published in the form of serial reports. Feeling that the results of certain of these studies are of general interest they have been summarized in the following article.

Operations of Transformers on a Temperature Basis

The question of loading transformers on a temperature basis, taking advantage of the fact that ambient temperatures particularly at the time of peak loads are in a great many cases well below the standard of 40 deg. C., is one of considerable economic importance in permitting greater loads to be carried with a given investment. This subject was included in an inquiry sent to operating companies throughout the country, and in replying, a number of companies stated that they had given consideration to this matter. Several specific cases were reported where transformers had carried loads in excess of nameplate rating. A few companies stated that they operate transformers on a maximum temperature basis in emergencies.

Although one company which has been loading transformers according to ambient temperatures for the past few years found that maximum temperature operation was not entirely satisfactory because of the fact that temperature gradients are increased and hot spots may develop without corresponding rises in observable temperatures, it appears that operation on a temperature basis has in general been satisfactory, particularly if the transformer is equipped with a winding temperature indicator. No data, however, are available on the effect of the higher average temperatures on the life of insulation.

On the other hand, several companies feel that transformer loading cannot in general be increased over nameplate rating because of increased oil sludging, increased voltage regulation, increased maintenance costs, or because of high ambient temperatures in their respective territories. However, this is not a reason for not operating upon a temperature basis since no higher operating temperatures would result than if fully loaded with an ambient of 40 deg. C.

After further consideration of the question of transformer operation on a temperature basis at the Philadelphia and Cleveland meetings of the Electrical Apparatus Committee, the following resolution referring to the proposed A. I. E. E. rules on this subject was passed at the Cleveland meeting:

> *Resolved:*
>
> That paragraphs 13-600, 13-601, 13-602, and 13-603 on recommendations for the operation of transformers on a temperature basis published by the A. I. E. E., in the "Report on Standards for Transformers, Induction Regulators and Reactors (proposed revision of present standard, section 13)" dated August, 1928, are hereby approved by the Electrical Apparatus Committee as a suitable basis for securing operating experience on the effect of operation of transformers at ambient temperatures other than 40 deg. cent. for air and 25 deg. cent. for water.

The paragraphs of the A. I. E. E. report on Section 13 of the Standards referred to in the resolution are as follows:

Recommendations for the Operation of Transformers, Induction Regulators and Reactors

13-600 Limiting Observable Temperature of Oil—The oil in which apparatus is permanently immersed should under no circumstances have a temperature, observable by thermometer, in excess of 90 deg. cent.

13-601 Operation at Rated Load—Apparatus conforming with the Standards for rating is suitable for carrying rated load continuously provided that the temperature of the cooling medium does not exceed 40 deg. cent, for air or 25 deg. cent. for water.

13-602 Operation with Cooling Air and Water Exceeding 40 Deg. Cent. and 25 Deg. Cent. Respectively — For apparatus conforming with the Standards for rating, the load should be reduced two per cent below the rated load for each degree that the temperature of the cooling air exceeds 40 deg. cent., or that the temperature of the cooling water exceeds 25 deg. cent. However, the use of apparatus in cooling air exceeding 50 deg. cent. or in cooling water exceeding 35 deg. cent. shall be considered as special.

13-603 Operation at Loads Greater than the Rated Load — (a) Apparatus not Equipped with a Winding Temperature Indicator: Apparatus not equipped with a winding temperature indicator may be loaded continuously one per cent above rated load for each degree centrigrade that the temperature of the cooling medium is below 30 deg. cent. for air or 25 deg. cent. for water.

Thus, for example, when the temperature of the cooling medium is 0 deg. cent., the permissible continuous load is 130 per cent of rated load for air-cooled apparatus and 125 per cent of rated load for water-cooled apparatus.

Loads greater than 130 per cent of rated load for air-cooled apparatus or 125 per cent of rated load for water-cooled apparatus shall not be applied under any conditions even though the temperature of the cooling medium be lower than 0 deg. cent.

(b) Apparatus Equipped with a Winding-Temperature Indicator: Apparatus equipped with a winding temperature indicator may be loaded continuously in excess of rated load provided the indicated winding temperature does not exceed the following limits:

For indicators marked in terms of:
Hottest-spot Temperature, 95 deg. cent.
Embedded Detector Temperature, 90 deg. cent.
Resistance Method Temperature, 85 deg. cent.

(c) Oil Temperatures: Oil temperature alone is an inadequate criterion of the winding temperature because of the increased temperature drop through the insulation at low temperatures of the cooling medium and of the time lag between the winding and oil temperatures.

Loading apparatus on the basis of oil temperature alone as a guide is not recognized by the A. I. E. E.

Standard Ambient Temperatures for Rating Electrical Machinery

At the Bellagio meetings of the International Electrotechnical Commission certain colder climate countries in Europe expressed a desire to change the present standard ambient temperature of 40 deg. C. for rating electrical equipment to 35 deg. C., or possibly 30 deg. C. The U. S. National Committee of the I. E. C. opposed this change, and since the Bellagio meeting, has reaffirmed its stand. This question was considered by the Electrical Apparatus Committee at the Cleveland meeting, and it was the consensus of opinion that no change was desirable at this time in the present standard ambient temperature, particularly in view of the fact that on transformers at least it will be possible under the proposed A. I. E. E. rules to take advantage of ambient temperatures lower than the standard. The following resolution was therefore passed by the Electrical Apparatus Committee:

Resolved:

> That the Electrical Apparatus Committee subscribes to the recommendation of the U. S. National Committee of the I. E. C., that no change be made in the present standard ambient temperature of 40 deg. cent. for rating electrical equipment.

Standardization of Transformer Impedance

In view of the fact that the tendency in manufacturing seems to be toward higher impedance in transformers, with the result that difficulty is sometimes experienced in paralleling and banking new and old transformers, it has been suggested that some standard be adopted for transformer impedance. More than half of sixty companies replying to an inquiry on this subject answered in the affirmative to a question as to whether such standardization would be of material value to them. Several companies pointed out the relation between impedance and short circuit currents, and some suggested that several different values of impedance might have to be standardized. Some pointed out that standardization would hamper developments in design.

Transformer Impedance Tolerance Factors

Consideration has been given to international standardization through the I. E. C. of the plus or minus 10 per cent tolerance factor for the transformer impedance as adopted some time ago by the N. E. M. A. Some members of the Electrical Apparatus Committee have taken the position that this value is too liberal, as it may result in considerable loss of transformer capacity where transformer banks are operated in parallel. It appears that if a plus or minus 5 per cent tolerance factor is specified there is no difficulty in obtaining transformers having impedances within 5 per cent of the guaranteed value, and the opinion has been expressed that a tolerance factor of plus or minus 5 per cent should be entirely satisfactory for all transformers, with the possible exceptions of certain three winding transformers and those of a special nature. It seemed desirable that an American standard should first be agreed upon before this matter is brought up for international standardization, and an inquiry was therefore addressed to the membership of the Electrical Apparatus Committee on this subject. In response to this inquiry, twenty-six companies submitted data covering a total of 570 transformers of so-called normal design, including transformers with capacity rating up to 25,000 kv-a. and voltage ratings up to 140,000 volts. Of the 570 transformers, 432, or 74 per cent were found to have a tested impedance within 5 per cent above or below the specified impedance value, and an analysis of the data indicated that a tolerance factor of plus or minus 5 per cent is suitable for all transformers having no special features. The general opinion of the various companies which submitted data was that a tolerance factor of plus or minus 5 per cent was a fair value.

The results of this inquiry were submitted to the manufacturers' representatives on the Transformer and Regulator Group, with the suggestion that a plus or minus 5 per cent tolerance factor be adopted, this factor to apply to all transformers except those (to be definitely designated) having special characteristics. The manufacturers, however, opposed the suggested reduction, on the basis that due to difficulties in predetermining transformer impedance and to manufacturing difficulties, it sometimes happens that transformers manufactured to the same specification have tested impedances which differ by more than 5 per cent. It is the manufacturers' feeling, as expressed by their representatives on the Transformer and Regulator Group, that the troubles experienced by operating companies in paralleling transformers which fall within the present tolerance limits of plus or minus 10 per cent have been so few that the proposed reduction is not warranted. They also point out that the mathematical probability of a transformer 10 per cent above the specified impedance being called upon to operate in parallel with one 10 per cent below the specified impedance is extremely small, but that in general if this should happen the transformer taking more than its share of the load will be able to do so without exceeding the guaranteed temperature rise, and that the total losses under this condition will be about the same as the total losses with the two banks operating independently. Should the actual temperature rise exceed the guaranteed rise, however, they believe that extra radiating surface might be added or cooling coils changed so as to bring the temperature rise within the guaranteed value.

It is felt that while such changes as suggested might be easily taken care of in the case of new transformers, it might be difficult, if not impossible, in some cases, to have the changes made on existing transformers, particularly if they were not of the same manufacture as those with which they are to parallel.

In any event, it would seem that no modifications of any kind should be necessary, for it appears to be a fundamental principle that any type of electrical apparatus, built to definite specifications with accepted tolerance factors, should have the ability to operate in parallel with similar units without exceeding guarantees or subjecting the user to loss of capacity. Moreover, certain companies specify a 5 per cent tolerance and have actually purchased transformers in accordance with such specifications.

In proceeding with this matter, the Transformer and Regulator Group is obtaining specific information from operating companies in regard to difficulties they have experienced in parallel operation of transformers, and discussions with the manufacturers will be continued.

Standards for Accessories

The comment has been made that the N. E. L. A. standards for transformers have not been very rigidly adhered to as regards accessories. However, answers to an inquiry as to the adequacy of the present standards indicate a general sentiment to the effect that the standards are satisfactory. Although several companies suggested modifications desirable from their point of view, there was no general agreement on any of the changes proposed.

It has been suggested that the locations for accessories be standardized. Nearly half of the sixty companies replying to the inquiry believe that locations can be standardized, and several feel that partial standardization can be effected. Several divergent views on proper locations were expressed. Quite a number of companies in stating that locations could be standardized expressed doubt as to whether anything is to be gained by so doing.

Three-Phase Potential Transformers

The opinion is held by some engineers that there is a wide need for three-phase potential transformers, but at the present time because of the comparatively small production, the cost is so high that their use is not justified economically. In response to a question as to whether there would be a demand for three-phase units provided they permitted a substantial saving over single-phase units, the majority of companies stated that they would use the three-phase transformers, although several qualified their statement to the effect that reliability of three-phase units would have to be improved. Nearly half of the companies expressed a preference for single-phase units. A few pointed out that the three-phase unit should cost less than two single-phase units.

This article has been published not only for the purpose of presenting information, but to obtain suggestions and comments. Therefore, it is hoped that anyone desiring to comment upon the subjects included or to offer suggestions regarding future studies will communicate with the Chairman of the Substation Subcommittee.

The date of the Engineering Section Session at the convention has ben changed from Wednesday, June 5, to Tuesday, June 4, at 3 p.m.

Inductive Relations Between Transmission Lines and Toll Lines Under Study by Joint Committee

THE problem of noise in telephone circuits when paralleled by transmission circuits is about as old as the arts of transmission of speech and energy by electricity. Project Committee No. 1* has been actively working on this phase of the physical relations between supply and communication circuits for about four years. Although no reports have been issued based on this work considerable progress has been made toward a solution. Last month an article outlined the work that Project 2 is doing on low frequency induction and this article is intended to show the progress that Project 1 is making on its study of voice frequency induction. It should be remembered that with the growth of both classes of service it is essential that due consideration be given by each to the other in order that neither will be unnecessarily hindered. This can be accomplished only when all the fundamentals of the problem are known and understood by both the interested parties.

Project 1 is assigned this problem which, briefly stated, involves the determination of the magnitudes and sources of noise currents appearing at the toll-circuit terminals of a telephone line, paralleled by a power line for various circuit conditions in both plants.

The problem is being analyzed from three standpoints, namely:

1. Development of improved methods, and accumulation of data, for estimating inductive effects.
2. Development of methods of test for use as practical aids in the field investigation of cases of inductive interference.
3. Development and application of improved preventive and remedial measures.

Special Apparatus Required

It was apparent at the outset that, in order to make any progress in the analysis of the complicated phenomena involved, it would be necessary to proceed on the basis of studying effects at various single frequencies over the range of interest, namely from about 200 to 3000 cycles.

Satisfactory apparatus for the supply of three-phase power at voice frequencies, and for the precise measurement of small currents and voltages through this range were not available, and consequently special equipment had to be designed and constructed. For the supply of three-phase high-frequency power, two generators of special design were constructed, one covering the range 200-800 cycles with a maximum output of 80 kv-a the other covering the range from 800-3200 cycles with a maximum output of 40 kv-a. As a single-phase source of supply, use is made of a standard adjustable-frequency vacuum-tube oscillator and power amplifier. For measuring purposes, selective-circuit amplifier meters were developed. These instruments are of the direct-reading, indicating type. The most sensitive types are capable of measuring as low as 0.05 microamperes and 0.05 millivolts. The selective-circuit feature of these instruments is essential in order to eliminate the effect of extraneous currents normally present on a telephone line, and also to eliminate the effect of any harmonics in the special source of high-frequency power supply.

Test Locations

The committee has engaged in field tests near Cincinnati, Ohio and Terre Haute, Indiana, the latter investigation being still under way. The Cincinnati location involved a 66 kv, three-phase power line and a 20-wire telephone lead at highway separation, with a d-c. trolley system between the two. The exposure length was about 4 miles. Since the total length of the telephone line available was less than 15 miles, tests were largely limited to the measurement of inductive effects within the exposure section.

The Terre Haute location offers a 4-mile exposure between a 33-kv, three-phase power line and a 30-wire telephone lead at a pole-line separation of about 25 feet. The physical situation here is also complicated by the presence of a d-c. trolley system. The illustration herewith shows the exposure section, and also the three test houses which have been provided at the chief measuring point.

The telephone line extended as a 30-wire lead, with some additional circuits over parts of the length, for a distance of 100 miles beyond the exposure section. The availability of this line made it possible to secure a large body of information regarding inductive effects on a long telephone line.

During the major part of the investigation in Terre Haute there have been actively engaged in the field three engineers from the National Electric Light Association and three engineers and a lineman from the American Telephone and Telegraph Company.

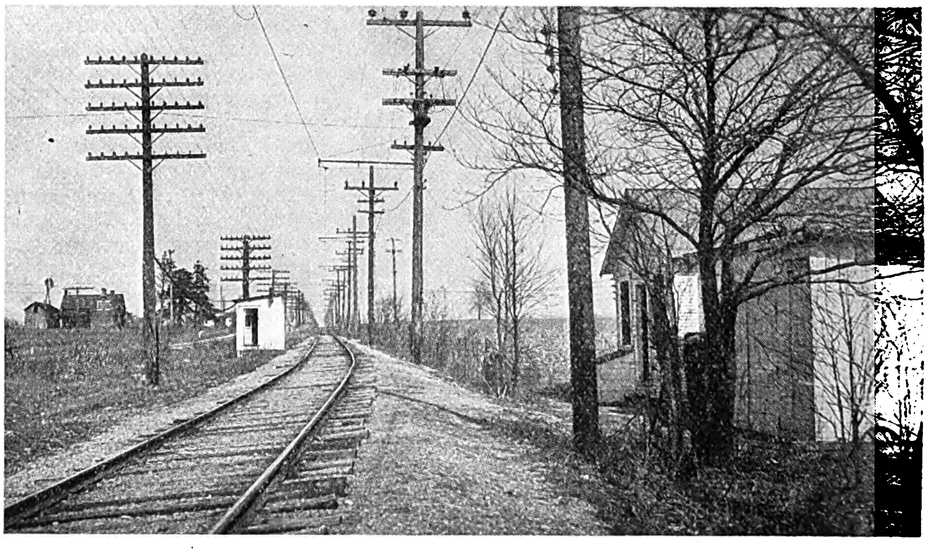
Accomplishments to Date

Three particular lines of endeavor upon which the Project Committee has been making definite progress and which offer promise of early practical value are indicated below:

1. A new method of measuring balance of telephone circuits outside exposure sections.
2. A method of computing the propagation of current and voltage along a telephone lead with ground return.
3. Terminations to be applied at the ends of an isolated section of telephone line to simulate for test purposes, the effect of connecting the section through to a long line.

The first two items have a bearing on the metallic-circuit currents which arise outside of an exposure section. Item 3 concerns the metallic-circuit currents inside the exposure section. The relative importance of these two components depends upon the particular circumstances in any individual case. In the general case each must be considered.

In addition to the specific items mentioned above, the work of the project has resulted in a completion of the major part of the necessary fundamental analysis of its problem. It is probable that upon the termination during the present year of the work in Terre Haute, Indiana, the Project Subcommittee will be in a position to suggest methods of estimating inductive effects for cases of exposure between open-wire toll lines and power lines. The practical application of these methods of computation will require the use of certain empirical factors the magnitudes of which differ considerably in different locations. Some data on these factors are already at hand. In order to secure a representative body of information on their range of magnitude, some further work will be required in situations having quite different physical characteristics.



Exposure Test Section Near Terre Haute, Indiana

The two houses at the right of the track contain the power supply and measuring equipment. The smaller house at the left contains the telephone measuring equipment and special facilities for terminating the telephone line.

Preferred Voltage Ratings for A-C Systems

THE following is abstracted from Mr. A. L. Harding's paper presented at the Annual Meeting of the Engineering Section, Northwest Electric Light and Power Association, Walla Walla, Wash., March 26, 1929. A report of the Joint Committee on Preferred Voltage Ratings of the N. E. L. A. and the N. E. M. A., presenting the same conclusions as those in this article, was approved by the Executive Committee of the Engineering National Section N. E. L. A. at its meeting in Memphis, Tenn., March 12, 1929.

The table on the next page, designated as Table 1, shows the preferred voltage ratings arrived at by the Joint Committee. The following comments apply: The phrase "nominal system voltage" means not the voltage of any particular point in a system but merely a value assigned for the purpose of convenient designation to a system of a given voltage class.

Nominal voltage is more nearly the voltage which will apply at receiving points. Practice in the United States has given recognition to nominal values in even multiples of eleven; for example, 11,000, 33,000 110,000 volts. The Joint Committee work has been concerned to a large degree in selecting those voltages which are really the basic nominal values. The Joint Committee has agreed upon a list of recognized nominal system voltages as shown in the left hand column of Table 1.

In examining the proposed scheme or system of apparatus voltage ratings, it is important at the outset to establish a proper basic viewpoint. What operating companies are most interested in is the standardization of service voltage which must be kept approximately at constant voltage through all ranges of load. The following table shows values that are significant as indicating the trend of American practice in utilization voltages.

SUMMARY OF PRACTICE OF CENTRAL STATIONS AS REGARDS LAMP VOLTAGE
Number of Communities

Lighting Voltage	1923	Per Cent	1928	Per Cent	Change Per Cent
110 volts	6,976	47.7	3,751	19.9	—27.8
115 volts	5,226	35.6	12,879	68.2	+32.6
120 volts	1,197	8.2	2,088	11.2	+ 2.9

The most important apparatus link in the distribution circuit is the distribution transformer. The present cataloged standard distribution transformers in the 2300 volt class are 20:1 ratio 2300 to 115 volts without taps. Under the voltage drop characteristics of a typical distribution system voltage of a supply substation must vary between approximately 2400 and 2670 volts. For this reason the proposed reratings of distribution transformers as shown in columns 4 and 5 of Table 1 and the accompanying comments were adopted. Corresponding dispositions were made in the voltage ratings and transformers for substations and general purpose use and for the transformers and generating stations for supplying high voltage systems as well as for those of reversible tie apparatus; the appropriate columns in Table 1, with the accompanying comments, set forth the range of conditions which these are designed to meet.

As an indication of the attitude of engineers toward this new schedule, member companies of the N. E. L. A. were canvassed recently, and the replies indicate that some 75 per cent are willing to conform to the new schedule, and the majority of the remainder are willing to use the proposed standards at least in part. It should be kept in mind, however, that there will be a certain number of power companies with well established off-standard voltages who may never be able economically to convert to the new schedule. While these companies will thus receive no direct benefit from the proposed standardization, they will on the other hand not be affected adversely and will merely be obliged to continue the purchase of their off-standard voltage ratings as at present. The same condition will apply to systems with extra long transmission distances involving line drops beyond the type of range provided in the proposed transformer rating standards.

Delegates to World Engineering Congress to Sail for Tokio Oct. 11

FORMATION of 90 local committees to aid in recruiting a large delegation of American engineers to attend the forthcoming World Engineering Congress at Tokyo has been announced by Dr. Elmer A. Sperry, chairman of the American committee arranging participation in the event.

The 90 committees will work with the various sub-committees of the American committee to maintain interest between now and Oct. 29, the opening date of the congress. Two thousand feet of new motion-picture film from Japan, showing points of interest for engineers, has been procured.

An international laboratory of world achievements in electrical engineering will be conducted at the engineering congress in Tokyo, and to it electrical engineers of prominence from New York, Philadelphia, Pittsburgh, Atlanta, San Francisco and other American cities will contribute papers sponsored by the American Institute of Electrical Engineers. Farley Osgood, P. M. Downing, W. E. Mitchell and E. C. Stone, for instance, are collaborating on a paper on "Interconnection and Its Effect on Power Development"; "Remote Operating Supervision and Control of Electric Power Stations and Substations" is the subject of a joint paper by Chester Lichtenberg and F. Zogbaum, and other American papers include: "Results of the Operation of Turbo-Generators on a Total-Temperature Rather than a Temperature-Rise Basis," by Philip Torchio; "American Power-Station Electrical Equipment," by F. D. Newbury; "High-Tension Electric Cables," by William A. Del Mar; "Extra-High-Voltage Transmission Lines," by J. P. Jollyman and E. R. Stauffacher, and "Insulation of High-Voltage Overhead Transmission Lines and Insulators," by Arthur O. Austin.

Through Maurice Holland, executive secretary of the American committee, it is announced that the *President Jackson* of the Dollar Line has been reserved exclusively for this country's delegation and will sail from San Francisco on Oct. 11.

Street Lighting

(*Continued from page* 218)

street lighting, including only such underground as was provided for in the company's regular program.

Per Cent of Total Electric Revenue

The revenue received from municipal street lighting represented 6.221 per cent of the total electric revenue of the Public Service Company during 1927. The analysis of the electric revenue is shown in the following table.

Sources of Electric Revenue

Sources	*Revenue*	*Per Cent*
Metered Sales Lighting	$31,621,240.90	61.0427
Metered Sales Power..	16,213,879.03	31.299
Flat Rate Sales-Lighting	22,158.85	0.042
Flat Rate Sales-Power	153.58	0.0003
Railroad Corporations	584,625.27	1.128
Other Electric Corporations	136,649.64	0.267
Municipal Street Lighting	3,223,081.71	6.221
Total	$51,801,788.98	100.00

The increases and percentage increases in street lighting revenue since 1920 are shown in the following table.

Street Lighting Revenue

Year	*Revenue*	*Per Cent Inc. of 1920*
1920.........	$1,553,913.82	....
1921.........	1,660,430.63	6.85
1922.........	1,827,569.65	17.61
1923.........	2,031,455.32	30.73
1924.........	2,283,696.88	46.96
1925.........	2,520,086.62	62.18
1926.........	2,879,286.34	85.29
1927.........	3,223,081.71	107.48

Conclusion

By using these methods the Public Service Company has effected approximately three-quarters of a million dollars increase in revenue during the last two years, proving that street lighting can be sold, and sold profitably. Judging by the number of 60-cp. lamps still in service, there is much in the nature of improvements which still remains to be done. There is no reason to believe that similar increases cannot be attained for several years to come, inasmuch as the territory served is fertile and is growing rapidly.

The future efforts of the company will be toward educating the public to higher intensities of street lighting and to really sell street lighting instead of street lamps.

NOTES

(*a*) Nominal voltage is a nominal value assigned for the purpose of convenient designation to a circuit or system of a given voltage class. Figures underlined indicate suggested trend of future practice.

(*b*) All motors are suitable for delivering rated hp. at rated frequency throughout a range of 10 per cent below to 10 per cent above rated voltage.

(*c*) Where a transformer is located remote from a generating station and is required to supply a system of another voltage (either lower or higher), the voltage ratings of transformers for substations and general purpose use are suitable.

(*d*) For all transformers, voltage ratings are no load, or turn ratios.

The primary winding is that winding which receives energy from the supply circuit.

Transformer excitation is normal when the voltage impressed on primary terminals under full rated load is sufficient to overcome regulation and obtain rated voltage on secondary terminals.

Transformers are suitable for delivering full-rated kva. output throughout a range of 5 per cent below to 5 per cent above rated voltage.

(*e*) Potential transformers are rated on primary the same as substation and general purpose transformer secondaries, and have approximate 115-volt rating on secondary. In the case of 2300 or 4600-volt nominal potential transformers for use on substation or station buses, feeding distribution systems or networks, a rating of 2500/4300 Y — 125 or 5000-125 is provided.

(*f*) Distribution transformers for 2300/4000 Y, or 4600 or 7620/13200 Y, or 13200-volt nominal distribution systems or networks using 110, 115 or 120-volt lamps are rated:

2300/ 4000 Y — 115/230 2400/ 4150 Y — 120/240 2500/ 4300 Y — 125/250	This transformer has no taps.
2300/ 4600 — 115/230 2400/ 4800 — 120/240 2500/ 5000 — 125/250	This transformer has no taps.

(*f*) C't'd

7620/13200 Y — 120/240 or 13200 — 120/240	These transformers have two (2) 5 per cent full-capacity taps on primary and are suitable for over-excitation, delivering a secondary voltage of 125/250 volts for use with 120-volt lamps.

(*g*) The preferred voltage rating for future practice for rural service is 7620/13200-volt nominal. Distribution transformers (note *f*) are suitable.

Rural service transformers for 6600/11430 Y or 11000-volt nominal rural service lines using 110 and 115-volt lamps are rated: 6900/11950 Y — 115/230. This transformer has three (3) 5 per cent full-capacity taps on primary.

(*h*) Substation transformers supplying 2300/4000 Y nominal distribution systems or networks using 110, 115 or 120-volt lamps are rated 2500/4300 Y secondary, with two (2) 5 per cent full-capacity taps and one (1) 5 per cent reduced capacity tap on primary (two to compensate for line regulation and one to obtain a ratio permitting operation at 2600/4500 Y for use with 120-volt lamps).

Substation transformers supplying 4600-volt nominal distribution systems or networks using 110, 115 or 120-volt lamps are rated 5000-volt secondary, with two (2) 5 per cent full-capacity taps and one (1) 5 per cent reduced capacity tap on primary (two to compensate for line regulation and one to obtain a ratio permitting operation at 5200 volts for use with 120-volt lamps).

(*i*) Substation transformers supplying 6600/11430 Y or 11000-volt nominal rural service lines using 110 or 115-volt lamps are rated 7200/12470 Y volts secondary, with two (2) 5 per cent full capacity taps on primary.

(*j*) All general apparatus has a tolerance of 5 per cent above rated voltage, except ratings 15000 volts and below, which are maximum.

(*k*) Generators are suitable for delivering full rated kva. output at rated power factor and frequency throughout a range of 5 per cent below to 5 per cent above rated voltage.

(*l*) Generators directly connected to buses serving nominal 2300 or 4000-volt distribution systems or networks are rated 2500 or 4300 volts.

Table 1

Spring Group Meeting Engineering National Section

THE Spring group meeting of the Engineering National Section, held in Memphis, Tenn., March 11 to 14, 1929, was well attended and very successful. The wisdom of the practice of holding these group meetings in different sections of the country was well justified by the presence of members of the section's committees from the South and Southwest, many of whom have not been seen at these meetings often enough.

A new order for the program, whereby the parallel sessions of committees were arranged so that those interested in the proceedings of somewhat similar committees could cover both, proved to be advantageous to members who have to travel great distances and who are, therefore, anxious to cover as many activities as possible.

The meeting has a good record of accomplishment. The report of the Joint Committee on Preferred Voltage Ratings was approved, and the N. E. L. A. members of the Joint Committee were empowered to continue their work for the purpose of adjusting those details that have not been finally settled.

Upon recommendation of the Accident Prevention Committee, the pamphlet "Common Sense" was approved by the Section Executive Committee. This pamphlet contains certain simple precautions and is recommended for distribution by companies to their customers.

The Electrical Apparatus Committee recommended approval of the proposal to include provisions for operating conditions in the Standards of the American Institute of Electrical Engineers relating to electrical machinery and equipment. The Section Executive Committee concurred in this recommendation.

The local arrangements for the meeting were admirable, and the Section acknowledged its debt to the Memphis Power and Light Company, the local committee under the chairmanship of Mark Eldredge, and to the Hotel Peabody. More detailed information from the various committees of the Engineering Section will appear in a later issue.

Memphis Meeting Accident Prevention Committee

By C. R. BEARDSLEY, *Chairman*

A WELL attended meeting of the Accident Prevention Committee was held at Memphis on March 12-13 in conjunction with the group meeting of the Engineering National Section.

For the past five years the annual statistics of fatality rates among employees show a wide spread. One Geographic Division reports a rate per 1000 employees nine times as great as that of other divisions. This is merely a symptom of the real disease, which may be partly described as follows: *Failure*

I. *Of Management* to inaugurate safety work.
II. *Of Officials* personally to take interest.
III. *Of Designers* to incorporate safety measures.
IV. *Of Superintendents* to adopt safe practices.

We cannot expect employees to become "safety-conscious" and continuously watchful, unless this work is inaugurated and continuously followed up as a regular program.

The Accident Prevention Committee devoted much thought and discussion to increasing its own effectiveness in relation to Divisional activities. One member remarked that "scads and scads" of really valuable reports, recording experience and practices proved to be effective in use, exist at N. E. L. A. Headquarters and in the highly polished bookcases in executive offices and company libraries, but do not reach the designers, foremen and others for whom they were prepared. This is the fault of those to whom the sample copies are sent. There is evidently a failure of appreciate potential values, and to secure complete distributions of reports and the adoption of the measures recommended.

The Geographic Division Accident Prevention Chairmen are responsible for correcting any such lethargy in their divisions. One report stated that about one-half the Divisions are active and effective. Five Divisions failed to report any activity whatever.

On the brighter side it was noted at Memphis that other engineering committees are taking increasing interest and are initiating studies of hazards peculiar to their work. This is fine and very encouraging to the Accident Prevention Committee.

The Accident Prevention Committee has increased the number of its members who are actively engaged in management, construction or operation in the field. Some of these members are representing Accident Prevention on the other committees. This type of member is of much potential value to both the committees for which he acts as liaison officer.

The practical viewpoints of these men have brought to light several hazards in need of study and correction. Six serial reports are scheduled in June together with other pamphlets and articles. Among these are to be "Automobile Accident Analysis," "Construction Safe Practices" (embodying hydro-electric and other branches not covered in No. 278-44), "Training Employees for Safety," "High Voltage Testing," "Catalog and Bibliography of Safety Devices and Methods" and "Statistics and Analyses." Other Serial Reports are under preparation but will hold over.

The Low Voltage Hazards Sub-committee has contributed many valuable precautions which have been incorporated in the "More Power to the Home" series. The Executive Committee of Engineering National Section has adopted for publication an envelope stuffer entitled "Common Sense" which will be published at an early date. This is designed to educate the public to avoid creating hazards in the home by use of worn out appliance cords and defective or sub-standard appliances.

The Executive Committee confirmed appointment of Wills MacLachlan, E. W. Gorry and C. R. Beardsley (ex. off.) to act with a similarly appointed committee of the American Gas Association in a revision of the Resuscitation Pamphlet No. 278-57.

Action of Insull Medal Awards Subcommittee on eighteen applications for the medal was ratified. This list is published elsewhere in this issue in the report of the Executive Committee meeting recently held in New York.

Discussion aimed at more intimate relations and cooperation with Public Utilities Section of National Safety Council were fruitful.

Other reports of satisfactory progress were read on Codes, Rubber Gloves, Hot Line Tools and Unusual Accidents.

Power Systems Engineering Committee Meeting

Engineering Plan of Systems

AT the mid-winter Cleveland meeting of the Power Systems Engineering Committee several utility executives gave talks on the broad aspects of system planning and system development. This program was followed at the Memphis meeting on March 11 and 12 with the presentation of the engineering plans of two metropolitan and two transmission systems. The engineering reasons for the system layout were given and each system was then discussed by the 75 men present at the meetings.

The Detroit Edison system engineering was presented by S. M. Dean, the Brooklyn Edison Company plan by J. A. Fairman, the American Gas and Electric Company plan by Philip Sporn and the Oklahoma Gas and Electric plan by F. J. Meyer. The distinguishing feature of the Detroit plan was the use of self-sustaining power areas each connected to other areas for emergency conditions. In the Brooklyn system a secondary network plan of distribution is being installed rapidly. The American Gas and Electric Company system consists of a narrow service area extending from near Chicago into Virginia with interconnected 132 kv. lines and several generating stations. The Oklahoma Gas and Electric system is based on a 66 kv. transmission system and several generating stations and rapidly developing oil field loads have made planning very difficult.

In a general discussion of engineering system planning the conclusion was reached that load density, load concentration and the space factor between loads were the deciding elements in system layout. No generalized expressions could be stated in a quantitative way because of the rapid changes in the art and in load conditions. Limitations in apparatus, the allowable energy concentration at any point, reliability of service, voltage regulation and system stability were presented as modifying factors to be used in the layout of any system. No positive conclusions could be had as to quantitative data on any of the elements discussed and further work of the committee will deal with more detailed analysis of some of the basic system engineering problems.

Metermen's Meeting at Cincinnati

TWO hundred meter executives of utilities throughout the Middle West attended a meeting at Cincinnati, Feb. 13 and 14, of the meter conference of the East Central Division, N. E. L. A. M. F. Smalley, Canton, Ohio, presided, and C. S. MacCalla, Youngstown, president of the division, described advances in the past year in meter practice. William Shuler, Dayton, chairman of the Engineering Section, discussed technical improvements; J. R. West, Akron, explained methods to make the largest number of tests a day consistent with accuracy; H. E. Buck, Canton, described the proper application of meters to connected load, and O. K. Coleman, American Gas & Electric Co., New York, spoke on "Instruments of Transmission and Their Proper Application."

Engineers to Study Farmer's Problem

A NATION-WIDE study of the agricultural industries, similar to the survey made by the Hoover Committee on Waste in Industry, is planned by the American Engineering Council. The survey will probably take five years to complete. The council hopes to undertake the survey in cooperation with the American Society of Agricultural Engineers, according to an announcement made by Lawrence W. Wallace, executive secretary of the council.

"We hope to initiate and prosecute a study which will encompass the economic, social, financial and engineering phases of agriculture," said Mr. Wallace, who was vice-chairman of the waste committee. He said that it was the conviction of engineers that such an analysis would lead to a fundamental and economic improvement in agriculture. He said the object of the study would be "to direct the attention, through methods of engineering analysis, to the hindrances of agricultural development and well-being and to suggest specific means of removing them on the basis of good agricultural practice and sound engineering thought."

A 1929 National Electrical Code Assured

AT its meeting of Feb. 18 and 19 the Electrical Committee of the National Fire Protection Association, which formulates the National Electrical Code, voted to bring out a 1929 revision of the Code. This revision will contain substantially the grounding rules of the 1925 Edition of the Code with such changes as may be necessary to bring these rules into suitable conformity with the other parts of the 1928 revision.

This action has met with general acceptance and it appears certain that this 1929 revision of the Code will receive the approval of the National Fire Protection Association and will be approved as an American Standard by the American Standards Association at an early date. In view of the forthcoming 1929 Code, it is believed that most enforcing authorities will not apply the objectionable grounding requirements of the 1928 revision pending the promulgation of the 1929 revision.

With the continuance of the 1925 grounding rules it follows that a more protracted and careful study of grounding requirements will be undertaken and the N. E. L. A. plans to proceed without break in its constructive program of collecting information which will furnish a better basis for the formulation of code requirements.

COMMERCIAL SECTION

MARSHALL E. SAMPSELL, *Chairman* C. E. GREENWOOD, *Commercial Director, N. E. L. A.*

National Industrial Heating School

AN Industrial Heating School, conducted under the auspices of the Industrial Heating Committee, Commercial National Section, with the assistance of the National Electrical Manufacturers Association, will be held at Cleveland, Ohio, starting May 14. The classroom sessions in Cleveland will be held at the Case School of Applied Science. The school will continue in Cleveland until May 21. On May 22 the school will be transferred to Detroit, Mich., and will be held there until May 24.

Inspection trips, which will alternate with classroom work, will be taken in Cleveland and vicinity, and Detroit.

The method of conducting the school this year is a radical departure from that of previous years. The lecturers will be men prominent in the industrial heating field drawn from the equipment manufacturers users of equipment, and central stations.

The following subjects will be covered:

The History and Development of Industrial Electric Heating.
The Market for Industrial Electric Heating.
Industrial Heating Surveys.
Electric Heating Elements in Industrial Heating.
Electric Heating Problems and Calculations.
The Application of Low-Temperature Heating Units.
Soft Metal Melting.
Industrial Ovens.
Fundamentals of Heat Treating.
Heat Treating (Below 1800 degrees).
Application of Electric Lead and Salt Bath Furnaces.
Electric Heat Treating (Above 1800 Degrees).
Vitreous Enameling.
Melting Brass.
Melting Steel.
Melting Gray Iron.
High Frequency Electric Heating Applications.
Application of Temperature Control Instruments.
Competitive Fuels.
Arc Welding.
Economics of Industrial Heating Practice.
Effective Sales Promotion.
Talks by Prominent Users of Electric Heating Equipment.

There is a registration fee of $5 which includes a copy of Wilcox's "Electric Heating." Upon enrollment in the school, a copy of this book will be mailed to each student. He is expected to study the first four chapters, covering the fundamentals of electric heating, before entering the school.

Central stations interested in load building are urged to send one or more of their best power engineers.

Enrollment and information blanks have been mailed from National Electric Light Association headquarters.

The enrollment blank should be filled out as soon as possible and mailed to J. L. Faden, Chairman, Industrial Heating Committee, 39 Boylston Street, Boston, Mass. The closing date for enrollment is May 1.

North Central Commercial Meeting

WITH the problems of introducing and selling modern electric appliances to the public as their convention theme, two hundred members of the Commercial Division of the North Central Electric Association discussed merchandising methods at a two-day session at Minneapolis on Feb. 25 and 26. C. J. Strike, vice-president of the Northwestern Public Service Company, was chairman. Kenneth McIntyre of the Society for Electrical Development and Miss Eloise Davidson of the N. E. L. A. home economics department spoke at the first session, followed by C. E. Greenwood, commercial director N. E. L. A.

H. E. Young, Northern States Power Company, said that a feature of merchandising electric refrigerators had been the manner in which manufacturers themselves had developed the market. The power companies have done most of the pioneering, he said. "Twenty-five per cent of lost sales are due to the indifference of the salespeople," Walter S. Byrne, vice-president of the Kilpatrick Company, Omaha, Neb., and former sales manager of the Nebraska Power Company, declared, speaking on "Merchandising Pitfalls."

"How to Sell Better Home Lighting" was discussed by H. E. Rademacker, Edison Lamp Works, Chicago, and Ell Bennett talked of new developments and practices in the sale of electric refrigeration. L. M. Pharis of Duluth, president of the association, spoke at the dinner-dance on Monday evening.

Tuesday's program included practical talks by H. E. Kahlert, Northern States Power Company, and Val Thorsen of St. Paul. T. T. Parker, president Northwestern Public Service Company, Huron, S. D., spoke on merchandising policies at a luncheon meeting. "Capitalizing Customer Contacts," by W. S. Heald, Minnesota Light & Power Company; "The Oil-Burner Load," by A. K. Baylor, General Electric Company, and "Utilizing a Salesman's Time Properly," by J. D. Broome, A B C Manufacturing Company, Peoria, Ill., were other papers, followed by discussions.

Northwest Commercial Section Conference

At the fourth annual mid-winter conference of the Commercial Section of the Northwest Electric Light and Power Association held at Spokane, Wash., Feb. 28 and March 1-2, talks by Chairman Lewis A. Lewis, J. E. E. Royer and M. L. Hibbard stressed the necessity for intensive commercial effort. Outside viewpoints on farm electrification were expressed by Dr. E. C. Holland, president Washington State College, and Fred W. Clemens, *Washington-Oregon-Idaho Farmer*.

Power Bureau meetings heard reports from the commercial cooking, industrial heating and power committees, presented respectively by C. J. Anderson, Carl Hoffman and E. E. Scofield. Mr. Scofield said that the maximum rate at which electric power could compete with Diesel engines in North Pacific Coast territory was 1½ cents per kilowatt-hour.

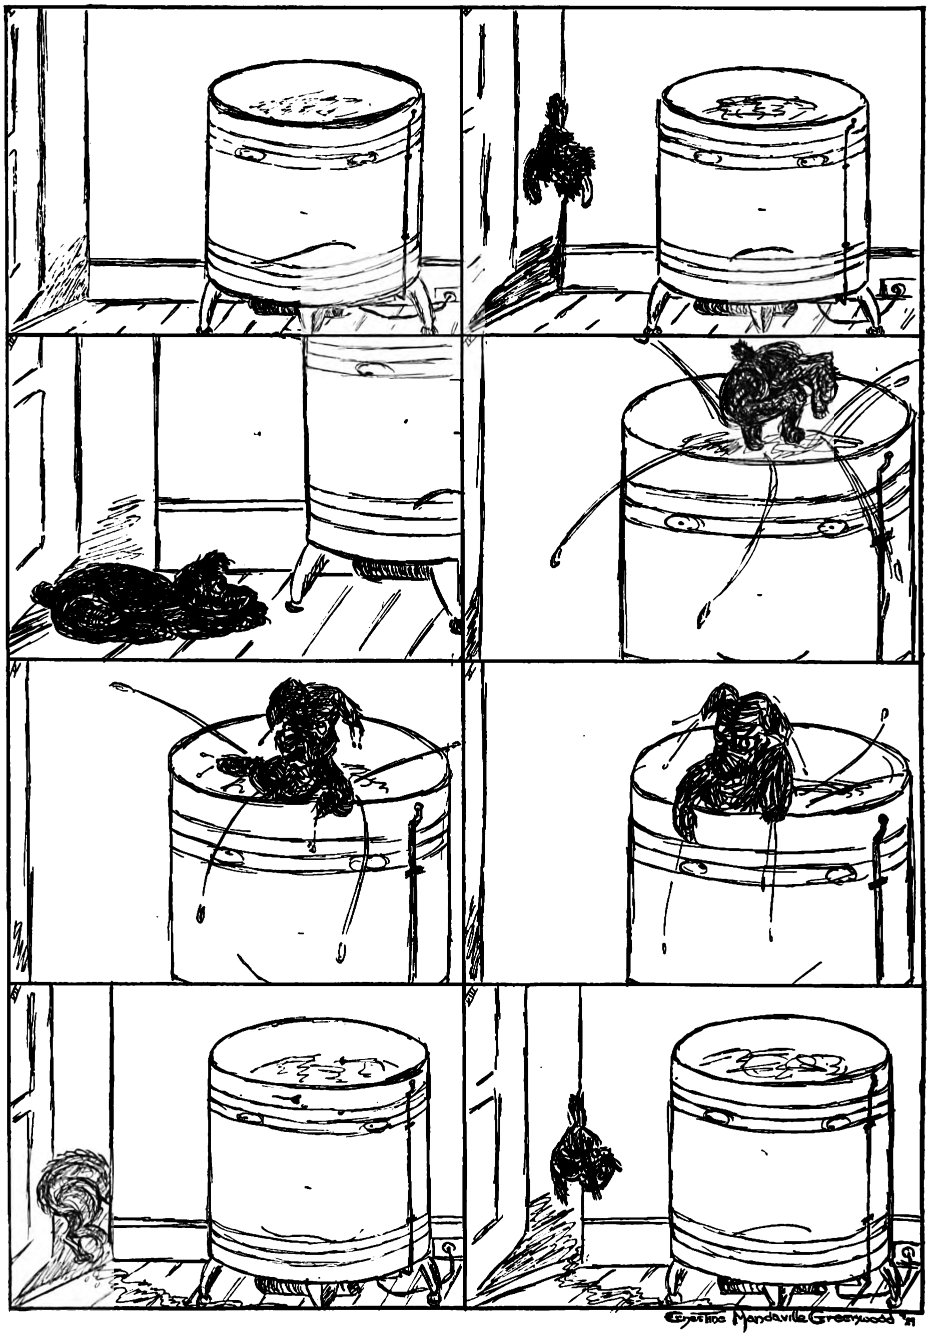
For the Merchandising Bureau, G. A. Kumler reported for the domestic range committee, Glenn L. Jackson for the domestic refrigeration committee and J. W. Wisdom, Jr., for the water-heating committee. All these reports brought out useful and up-to-the-minute facts on their respective subjects. The major portion of the report of the general merchandising committee, presented by H. W. Cooper, dealt with the question of sales organization.

Defining a promotional rate as one designed to induce the customer to use to a maximum the facilities required to serve him, the conclusion of the promotional rate committee, for which Thomas M. Gibbes reported, was that the greatest effect on increasing consumption and revenue was derived from a reduction in the price of the second step, with the greatest differential between the first and second steps; that the next effective influence was derived from a decrease in the sum produced by the first step, and that lowering the price of the first step had the least influence. Discussion called attention to the alleged bad psychology of the readiness-to-serve charge.

Lighting Bureau reports were from the electrical advertising committee; by T. W. Fitch; the home educational committee, by Fred Zaugg; the commercial and industrial lighting committee, by L. B. Gowan, and the street and highway lighting committee, by George M. Boyd.

The program of the rural electrification committee, with J. C. Scott as chairman, took the form of a symposium on how farm load could and should be developed. Selling to the farmer, cooperation with dealers, equipment and demonstration, farm specialists and organization of a rural department and advertising and literature were topics treated separately in a prepared symposium. One session was devoted to the subject, "Developing an Appreciation of the Value of Electric Service on the Farm" from different viewpoints, that of the power company being presented by A. C. McMicken.

THE ELECTRICAL ADVENTURES OF NAPOLEON II



After Some Personal Research He Reaches Certain Definite Conclusions as to the Efficiency of the Electric Washing Machine

PUBLIC RELATIONS SECTION

J. F. Owens, *Chairman* George F. Oxley, *Director, Department of Public Information, N. E. L. A.*

Public Relations National Section Executive Committee Meeting

Strengthening of voluntary cooperative activities between the electric light and power industry and the higher educational institutions of the country under authoritative guiding principles to be declared by educational administrators of national standing and experience was urged upon the industry by the executive committee of the Public Relations National Section at its third meeting of the administrative year held at N. E. L. A. Headquarters, March 6. The executive committee of the Section received, discussed and approved a statement and recommendations regarding these cooperative activities, as submitted by the public utility members of the Committee on Cooperation with Educational Institutions. At the meeting of the National Executive Committee at Headquarters, March 7, official ratification was given to the statement and recommendations.

The meeting of the Public Relations Executive Committee was one of the best attended of the year, there being 48 persons present, representing all but one Geographic Division. The meeting was called to order at 11 o'clock by Chairman Owens, who read a telegram from President Arkwright expressing regret because of his inability to be present. Headquarters' activities were outlined by Managing Director Paul S. Clapp.

Marshall E. Sampsell, Chairman of the Commercial National Section and E. C. Stone, Chairman of the Engineering National Section were present and briefly outlined the activities of their sections, calling particular attention to the manner in which the work of the several sections is being coordinated.

Cooperation with Educational Institutions

Chairman Carl D. Jackson of the Cooperation with Educational Institutions Committee reported completion of the survey conducted by Dean C. O. Ruggles and stated that the report was to be considered and finally passed upon by the educator members of the committee without reference to the utility members of the committee. He then read the following statement and recommendations, prepared and adopted at a meeting of the utility members of his committee at Headquarters, March 4 and 5:

> "This committee has considered the general situation in respect to cooperation by the industry with the higher educational institutions. In our opinion it has been clearly demonstrated that this cooperation is not only of mutual benefit but that it serves the public interest and should be continued and further developed.
>
> "There are, however, certain essential facts which we believe worthy of the most serious consideration. During the last year, this industry has been subjected to criticism in relation to some of the cooperative activities, and there exists in some quarters a misinterpretation of our motives and the opinion that there has not always been shown a complete appreciation of the high ethical standards which must at all times prevail in such activities. This Committee is convinced that modification of our present organization would reasonably provide in the future against any occasion for adverse criticism of cooperative relationships and further strengthen the field of useful cooperation.
>
> "The actual functions of cooperation have been generally exercised by organizations neither directly related to, nor cooperating with, this committee. The committee has lacked such contacts with State or local cooperative agencies as are essential for the formation and promulgation of national policies.
>
> "We recognize the fact that cooperation cannot be exercised efficiently or in the public interest merely through a centralized committee out of touch and inadequately acquainted with local conditions, demands or sentiments. Our organization rests upon a basis of voluntary cooperation as its mainspring. The major responsibility must remain local and any attempt at centralized control would be ineffective. A survey of the entire situation leads us to the following conclusions:
>
> "First: That it is desirable that there should be established in an authoritative way guiding principles to control future cooperative activities, such principles being in general those which should prevail between educational institutions on the one hand and electric light and power companies on the other hand. It is our belief that such principles can be best declared in an authoritative way by educational administrators of national standing and experience. We recommend to our Association the furtherance and encouragement of such measures as may be best fitted to secure such declaration of principles.
>
> "Secondly: We recommend more efficient cooperation within our organization to assure sound development of relations with educational institutions, free from legitimate criticism, and such as to sustain with the educators that confidence in our activities and purposes that must at all times prevail if the best interests of the public and all concerned are to be served. We believe that the following plan will lead to this result without trespassing on the full measure of local responsibility in such activities and we recommend that steps be taken to put the plan in effect in the immediate future.
>
> "We recommend that each geographic representative of this committee take up with leading executives in each State within his division the initiation of such steps by the utility executives in connection with administrative heads of educational institutions as will bring about in each State the selection of an industry representative satisfactory to the educational institutions to whom in each State there shall be referred for approval all proposed cooperative activities.
>
> "We further recommend that such representatives be requested to act as the State representatives on the geographic division committee of this committee.
>
> "The above statement and recommendations are hereby adopted by the utility members of the Committee on Cooperation with Educational Institutions, and we respectfully refer the same to the Executive Committee of the Public Relations National Section for its approval and such further action in connection therewith as it shall deem advisable."

Customer Ownership

Interest in customer ownership throughout the country is low at present according to Chairman W. H. Hodge of the Customer Ownership Committee because present financial conditions have made other methods of financing preferable.

Chairman Hodge called attention to the lack of cooperation being given to the National Better Business Bureau by the electrical industry and submitted to the executive committee of the section the following recommendations, which were approved and referred to the National Executive Committee:

> "The Chairman of the Customer Ownership Committee respectfully calls the attention of the Public Relations Section to the fact that response of member companies to the recommendation of the Customer Ownership Committee that financial support be accorded to the National Better Business Bureau has been very poor. Total contributions since October, 1928, amount to only $900. Attention is further directed to the importance of protecting utility stockholders through the National Better Business Bureau, and also to the desirability of utilizing the services of that Bureau toward preventing abuse of customer ownership principles by irresponsible companies and persons controlling a limited number of utility properties.
>
> "The Chairman therefore recommends that the foregoing be brought before the executive committee of the National Electric Light Association with the request that the executive committee take suitable action to urge member companies, and particularly holding companies of a national or semi-national character, to extend a suitable measure of financial support to the National Better Business Bureau."

On behalf of the Industrial Relations Committee it was reported that two serial reports have been prepared on "Training for Better Public Contact—Analysis of Public Contact Work" and "Health and Medical Instruction."

Public Speaking

Chairman W. S. Vivian of the Public Speaking Committee reported that public speaking activities in all parts of the country show an increase over those of previous years. He announced that the statistical chapter of the N. E. L. A. Handbook is being revised and will be made available for substitution in place of the old chapter prior to the convention. He reported that his committee has recommended a national speaking contest, details of which are to be evolved, and the executive committee approved the idea.

Women's Committee

Reporting for the Women's Committee, Miss Sophia Malicki, Chairman, stated that the program outline has been carried on energetically. The program includes economics of utilities with a special emphasis on rates and regulation, the importance of proper employee attitude toward the public and acquaintance with utility equipment in the home. She called attention to three short courses for utility women being conducted at universities in the Middle West. Chairman Malicki urged that more attention be given by the industry to the question of home service, emphasizing the importance of companies having home service departments.

Activities of the Department of Public Information were outlined by George F. Oxley, Director.

Details of the convention program were presented by Managing Director Paul S. Clapp. This information will be found elsewhere in this issue of the Bulletin.

Reports presented by the Geographic Division representatives indicate that the work of the section has been carried on aggressively throughout the year.

GEOGRAPHIC DIVISIONS and STATE ASSOCIATIONS

Southeastern Division Committees Meet

CONFERENCES of various committees of the Southeastern Geographic Division were held at Jacksonville, Fla., Feb. 12-14. The Meter Committee meeting took place on the 12th, and proved to be the largest attended meeting of this committee held during the current year and one of the most interesting and instructive, according to E. A. Corum, Memphis Power and Light Company, chairman of the meter committee.

The balance of the committee meetings were held on the 14th, the day following the rural service conference, which is discussed elsewwhere in this issue. Included in the committees were the Executive, and those of the Accounting, Commercial, Engineering and Public Relations sections.

Individual committee meetings got under way promptly at 9.30. In addition to the committees named above, the Meter Committee held a meeting on the morning of the 14th and wound up unfinished business and discussed various metering problems.

The Accounting Section met in two divisions, the Customers' Records Committee and the Purchasing and Storeroom Committee. C. J. Curry, Carolina Power and Light Co., is chairman of the Accounting Section, and C. A. Raymond, Tampa Electric Company, chairman of the Customers' Records Committee, and Thomas Bartlett, Florida Power Corporation, chairman of the Purchasing and Storeroom Committee.

The Public Relations Section met with J. P. Dick, Georgia Power Company, chairman, in two sections; the Women's Committee under the leadership of Mrs. Jane Pratt, Alabama Power Company, and the Customer-Employees Relations Committee under the chairmanship of F. R. Mitchell, of the Alabama Power Company.

The largest attendance was in the Engineering section meetings, and credit is due H. J. Scholz, of the Alabama Power Company, chairman of the Engineering Section, for the interest displayed in the engineering activities of the Southeastern Division.

The six engineering committees meeting included the Accident Prevention; Overhead-Underground Systems; Inductive Coordination; Electrical Apparatus; Prime Movers and Meter Committees.

The Accident Prevention Committee, R. B. Grove, Florida Power and Light Company, chairman, discussed the revision of rules governing accident prevention contests at some length. Another discussion centered around safety rallies and the benefits from such activities. The subject of rubber protective devices came in for considerable discussion, including testing of equipment and the best means of testing and discarding gloves. There was also a discussion on the use and care of portable fire extinguishers.

The Inductive Coordination Committee, under the chairmanship of H. L. Wills, Georgia Power Company, discussed a number of pertinent subjects, including neutral grounding through current limiting devices; the necessity for using and caring for rubber gloves; railroad and wire crossings and the ventilation of transformer vaults.

The Electrical Apparatus Committee, under the chairmanship of E. E. George, Tennessee Electric Power Company, has been particularly active during the past year. At the Jacksonville meeting the committee discussed at some length the methods of calculating ground currents; the staging of system tests; measuring ground resistance; automatic frequency control; substation control and ending with a general discussion of codes and standards.

The Prime Movers Committee, J. H. White, Florida Power and Light Company, chairman, took up a variety of subjects for discussion. The operation and maintenance of turbines and condensors was the first problem, followed by discussion on the care of standby stations and plants; station instruments; feed water treatment as studied by the Southeastern Division, N. E. L. A.; governors for hydraulic turbines; the influence of a knowledge of water consumption and the possession of accurate water rate curves on station economy of hydro plants; automatic hydroelectric plants; methods of conducting dam and gate leakage investigations. These discussions were followed by papers on air preheaters and on steam flow forecasting in the Southeast.

The Commercial Section also drew a good attendance, and there were many interesting discussions in the various committee meetings. Charles Preston, Florida Power and Light Company, is chairman of the Commercial Section.

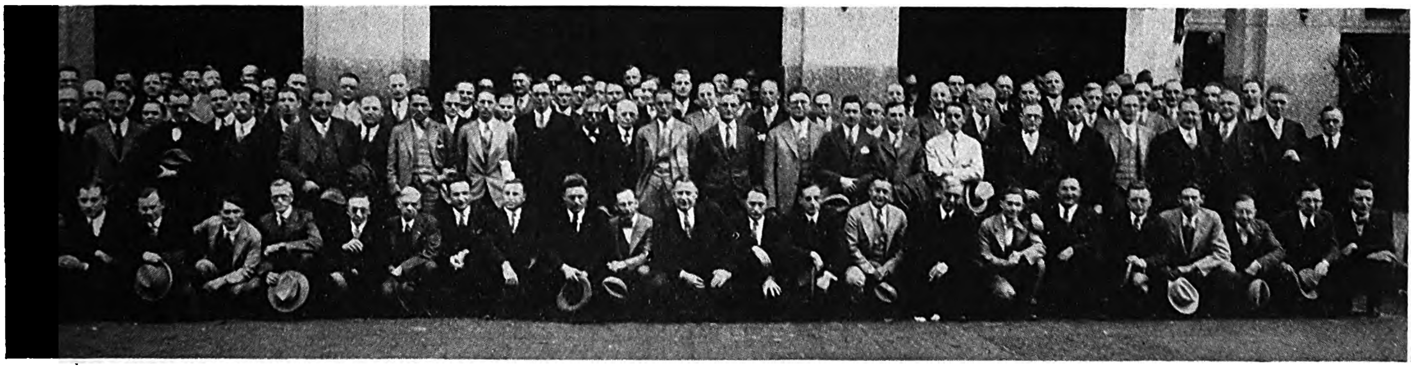
The Merchandising Policies Committee, Lee Goodwin, Durham Public Service Company, chairman, discussed the participation in prize contests; using employees as salesmen during campaigns; trade relations with other organizations selling electrical goods; practices employed in selling radio sets and equipment. There was considerable discussion on the sales of sub-standard equipment, with the general opinion expressed that the power companies cannot afford to handle anything but quality merchandise.

The Farm Equipment Committee met with E. E. Ensor, Gulf Power Company, chairman, and discussed the many items which are offered for sale to the farm customers.

The Water Heating Committee, W. H. McInnis, Columbus Electric and Power Company, chairman, had an excellent report on the progress made in surveying the water heating possibilities.

The Refrigeration Committee, W. B. Harris, Knoville Power and Light Company, chairman, had several good reports.

There was considerable interest shown in the Lighting Committee, led by B. H. Martin, Tennessee Electric Power Company.



Group of Delegates to Southeastern Division Committees Meeting

Joint Convention of Illinois Associations

A JOINT convention of the Illinois State Electric, the Illinois Electric Railways, and the Illinois Gas Associations was held at Springfield, March 14-15. Approximately 900 delegates were in attendance. Eight addresses were given before joint morning meetings, and six papers were read before the Illinois State Electric Association at the separate afternoon sessions of that division. The women's committee had, besides, a session of its own.

Governor Louis L. Emmerson, who addressed a joint meeting Friday morning, reaffirmed his faith in the State's system of utility regulation, saying:

"I believe the powers vested in the Illinois Commerce Commission under present laws are sufficient to insure intelligent regulation. It will be the policy of my administration to insist that these laws are administered by the commission in a manner which will result in the greatest benefit to the public and the fairest and most intelligent treatment of the utilities. I regard this commission as a court which should be composed of men of the highest integrity, and, being so constituted, it should function without executive suggestion or interference.

"Public ownership," the Governor went on, "is coming rapidly, but it is coming in the form of customer ownership and employee ownership. As the average man becomes more familiar with the investments in securities in corporations, and as the ultilities see more clearly the value of customer ownership, I am convinced the day approaches when most of your stockholders will be the people who use your service."

A second speaker on the Friday morning program, James D. Cunningham, president of the Illinois Manufacturers' Association and head of the Republic Flow Meters Company, Chicago, saw the solution of the farm problem in the increasing number of factories in small towns. The expense of maintaining plants in congested metropolitan districts is driving manufacturers to seek sites in smaller communities, and the availability of power in these communities will bring many industries from the city to the small town, he said.

The importance to the utility company of accurate statistics and all-inclusive data was stressed by Alexander Forward, secretary-treasurer of the American Gas Association. Exact figures on housing conditions in Chicago were given by E. V. Stevens, assistant statistician of the Commonwealth Edison Company, in an address on "Effective Use of Statistics," which was given before the electric group Friday. Vigorous sales campaigns were advocated by F. P. Cope, Allied Power & Light Corporation, Jackson, Mich., and by W. S. Vivian, Middle West Utilities Company, Chicago.

Mercury-arc rectifiers, in use by the Chicago & Joliet Electric Railways Company, have proved satisfactory, A. W. Baumgarten, division engineer of the road, reported. A rectifier at Lemont substation effected an estimated annual saving of $9,576, he said. A complete set of construction standards for rural electric lines was presented by J. D. Roberts, chief engineer Central Illinois Public Service Company, Springfield.

Others on the program were Tom C. Polk, secretary, Great Lakes Division, N. E. L. A.; J. F. Blackburn, Rockford Gas & Electric Company; S. E. Doane, General Electric Company; S. L. Hilyard, Illinois Power & Light Corporation; J. R. Pershall, Public Service Company of Northern Illinois; H. A. Kleinman, Moline; A. G. Ford, Aurora; Donald M. Mackie, Jackson, Mich., and Miss Isabell Davie, N. E. L. A. headquarters.

Officers of the Illinois State Electric Association chosen for 1930 were: President, E. F. Kelly, Central Illinois Public Service Company, Springfield; vice-president, Oliver Hogue, Commonwealth Edison Company. G. W. Schwaner, Springfield, was reelected secretary-treasurer of the three bodies.

Oklahoma Utilities Association Convention

MORE than 1000 delegates attended the eleventh annual convention of the Oklahoma Utilities Association, held March 12-14 at Oklahoma City. Approximately 600 utility men and their guests attended the annual banquet and entertainment Wednesday night. Col. Oscar H. Fogg, New York, president American Gas Association, was the principal speaker. Referring to the Federal Trade Commission's investigation of public utilities, Colonel Fogg said that he believed a careful examination of the records to date would show that, "except for occasional detached instances of thoughtlessness or misdirected zeal, the conduct of the utilities has been of a high standard, and their appreciation of their responsibilities to the public such as to merit respect."

Among leaders of the industry from outside of Oklahoma who addressed the convention was Martin J. Insull, president Middle West Utilities Company, who told of the various ways of financing public utilities and advised more attention to sale of securities to customers.

James B. Wootan, Chicago, editor *Public Service Magazine*, advocated the application of old moral standards to the operation of modern business, especially that of public utilities. He declared that most utility executives are trying to apply such standards.

The subject of the State regulation and present problems of public utilities was presented by W. J. Hagenah, vice-president H. M. Byllesby Engineering & Management Corporation. Rate regulation has been a pronounced success, he said. It has caused greater efficiency in financing and operation, increased the confidence of the public in utilities, made financing cheaper and easier, enabled companies to make voluntarily rate reductions aggregating many millions of dollars and benefited both the utilities and the public. In spite of this, he admitted, there is an aggressive fight against utilities in many parts of the country based on misinformation and prejudice.

During a safety conference, resolutions were adopted asking the executive board of the association to create an Accident Prevention Section. The new section will work actively to interchange ideas and experiences among members on accident prevention work, to stimulate interest in accident prevention and health work in companies which do not at present have such programs and to assist in educating the public on these matters.

On the final day of the meeting these officers were elected: President, Thomas R. Weymouth, Tulsa, president Oklahoma Natural Gas Corporation; first vice-president, T. H. Steffens, Sand Springs, president Sand Springs Railway Company; second vice-president, S. I. McElhoes, Oklahoma City, vice-president Southwestern Light & Power Company; treasurer (reelected), W. R. Emerson, Oklahoma City; manager (reelected), Edward F. McKay, Oklahoma City. R. K. Lane, Tulsa, vice-president Public Service Company of Oklahoma, was made chairman of the Electric Division and S. I. McElhoes the board member for that division.

Iowa Section Convention

ABOUT 350 members of the industry attended the operators' convention of the Iowa Section of the National Electric Light Association held at Sioux City on Feb. 26 and 27. The first general session, Tuesday morning, was devoted largely to a discussion of present practices of companies in rendering farm service. C. S. Macy, president of the Iowa Section of the N. E. L. A., presided. Reports relating to rate structures and construction were made by representatives of the larger light and power companies of the State. H. T. East of Chicago, chairman of the customer relations committee of the N. E. L. A. and representing the Public Service Co. of Northern Illinois, made an excellent talk on "This Thing Called Service."

Following the opening session the commercial men and the distribution men held separate sessions. At the commercial sessions papers by men prominent in the industry on sales management, ranges, refrigeration, advertising and the contractor-dealer's views were read and discussed.

Among the interesting papers read at the meeting of the distribution men were one by George A. Neal of the Iowa Public Service Co. of Sioux City on construction and maintenance methods which have resulted in lower costs for transmission and distribution and one by John Drabelle of the Iowa Railway & Light Corporation of Cedar Rapids on voltage regulation through voltage regulators and power-factor control. Another paper by J. B. Prince of the Sioux City Gas & Electric Co. on practical methods of locating radio interference causes elicited considerable discussion, in which the practices of various companies were explained.

The novelty of the convention was a paper read by Frank Doble of the Doble Engineering Co. at his office in Massachusetts and broadcast over the long-distance telephone.

The executive committee, which has in charge the operators' convention, was reelected with the addition of William A. Thompson of Davenport. The 1930 convention will be held in Davenport.

New Mexico Association Convention

WITH a record attendance, the fourteenth annual convention of the New Mexico Utilities Association was held at Albuquerque, Feb. 18-20.

Vice-President William W. Nielsen, manager New Mexico Power Company, Santa Fe, presided at the business sessions in place of President C. C. Ogle, who was recently transferred to a Texas property. Following the acting president's address, George E. Lewis, Denver, manager of the Rocky Mountain Committee on Public Utility Information, dwelt strongly on the desirability of convention delegates passing along the benefits derived from their attendance; Mrs. Ruth Steinhauser, director of public relations with the Texas-Louisiana Power Company, discussed "The Personal Element in Public Relations," and John J. Cooper, manager General Electric Supply Corporation, Denver, reviewed activities of the past year and pointed out that the residential field is still being neglected.

Fred Norcross, Home Gas & Electric Company, Greeley, Colo., told of the activities of the Commercial Section, N. E. L. A., of which he is division chairman. Mr. Norcross stressed the necessity of a proper rate structure in order to develop the load and thought that a 2-cent maximum rate is essential for general acceptance of the water heater.

K. W. Kissick, Deming (N. M.) Ice & Electric Company, told of his six years' experience in developing irrigation business. From the standpoint of bettering the load factor, Mr. Kissick recommended the use of ground storage tanks and smaller pumps to operate on a 24-hour basis.

Herbert Sands, consulting engineer, Denver, said that there are 148 different forms of rates in Colorado and urged more uniformity; "House Heating with Off-Peak Power" was presented by A. L. Jones, district manager General Electric Company, Denver, who told of the experiments being conducted in Fort Wayne, Ind., and A. C. Cornell, manager Graybar Electric Company, Denver, pointed out the economic necessity of the electrical wholesaler.

"Lest We Perish" was the subject discussed by George Bakewell, Jr., executive manager Electrical League of Colorado, Denver. Mr. Bakewell told of the aggressive manner in which other businesses are bidding for the consumer's dollar through national association activities and urged the industry to set the stage now in anticipation of the promotional plans soon to be launched through the Industry Sales Conference.

J. E. Loiseau, secretary Public Service Company of Colorado, Denver, opened Tuesday's session, discussing the proper selection and training of employees. He declared also that the utilities are paying 50 per cent more taxes than are economically justified. Francis C. Wilson, Water Commissioner of New Mexico, gave an analysis of the Boulder Dam situation and predicted that the generating equipment would be operated by private enterprise. Carrier telephony on transmission lines was the subject of an address by R. W. Goddard, dean of engineering, State College, New Mexico.

Officers elected are: President, William W. Nielsen, New Mexico Power Company, Santa Fe; first vice-president, Eugene A. Roberts, Southwestern Public Service Company, Carlsbad; second vice-president, Thomas C. Brown, Socorro Power & Light Company. B. L. Wiles, Albuquerque Gas & Electric Company, succeeds himself as secretary-treasurer.

RURAL ELECTRIFICATION

Conference on Rural Electrification Held in Southeastern Division

THE third of the Rural Electric Service Conferences being held by the various Geographic Divisions was staged by the Southeastern Division at Jacksonville, Fla., Feb. 13.

"Our most attractive market, and about the only remaining market, is in the rural districts," said Charles A. Collier, president of the Division, in opening the conference. "There are very few industries in this district manufacturing their own power; a large percentage of our urban homes are being supplied with electric service, and in order to extend our service, we must look to what we term rural sections," he said.

That rural electrification is to be given serious consideration is attested to by the large number of prominent utility officials who attended the conference, not only from the southeast, but from other sections of the country. With but a few exceptions, speakers on the program were men from this territory who are in close touch with developments in the rural districts as regards electrical service.

One of the most interesting speakers on the program was W. T. McCaskey, in charge of rural electrical service for the Middle West Utilities Company, Chicago, who outlined the purposes and the benefits of the conference.

H. M. Weathers, of the Alabama Power Company, read a paper prepared by W. M. Stanley, of the same company, on the organization work of the rural service department. The Alabama Power Company has been one of the leaders in rural development in the Southeast, and the paper brought many comments and occasioned considerable discussion.

The discussion following the paper was led by Charles Hammond, assistant to the sales manager of the Georgia Power Company, and A. T. Roberts, of the Columbus Electric and Power Company, Columbus, Ga.

While the morning session proved of interest and much value, the general discussions at the afternoon session provided the real "meat" of the conference. R. W. Williamson, general manager of the Gulf Power Company, started the afternoon session with a talk on Rural Rates—Types and Characteristics. C. A. Collier, who presided over the sessions, led the discussion following Mr. Williamson's talk.

It was brought out that there are numerous rates in effect on rural lines, and in many cases, despite the fact that rates are higher than for urban service, the rural lines in many cases are a losing proposition for the power companies. It was the general opinion that a careful study of rural rates be made in order that a fair rate might be decided on.

Another interesting talk was one by Charles Preston, sales manager of the Florida Power and Light Company, who described the demonstration farm of his company, and told of the many advantages of such a movement. The situation in Florida is somewhat different than in many States, and, as explained by Joe C. Guild, vice-president and general manager of Florida Power and Light Company, many of their rural lines serve customers who might be classed as industrial consumers, as in the case of fruit growers, who use electric service in preparing crops for markets, and numerous irrigation projects which consume quantities of power.

L. W. Gray, of the rural electric service department of the Georgia Power Company, discussed the effect of rural electrification in the Southeast as it affected agriculture, and pointed out several cases where farmers had increased their net profits by the use of power on the farm.

Another interesting discussion was led by E. C. Easter, agricultural engineer of the Alabama Power Company, on the effect of rural electrification within the utilities.

Dr. E. A. White, chairman of the National Committee on the Relation of Electricity to Agriculture, gave a highly interesting talk on the organization and development of rural service departments and what might be accomplished in the development of a rural market.

WOMEN'S COMMITTEE

Miss Sophia Malicki, *Chairman* Miss Isabell Davie, *Secretary*

News Letter

By Mrs. Thelma Van Ness

According to *Rail-Light News*, of the Nashville Railway and Light Co., at Nashville, Tenn., the Women's Committee is preparing for the public speaking contest soon to be held. Their subject is "How a Woman Employee Can Help Her Company Merit the Confidence of Its Customers."

* * *

Here is a suggestion from C. M. Kilian, Executive Secretary, Southeastern Division, N. E. L. A. He writes, "While attending a Women's Committee meeting the manager of the company took the opportunity of reading before the meeting the last series of newspaper ads you sent out and suggested that the women of the committee make a practice of using them as a part of their program regularly."

Note—(These advertisements are mailed to the advertising manager of your company by the Department of Public Information, N. E. L. A.)

* * *

A contest of the Wisconsin Women's Committee will end on May 1. Awards will be made on detailed reports of the activities and accomplishments of Women's Committees and individual members of Women's Committees. Awards will be based upon:

1. The program of activities adopted and carried out by the individual club or organization.
2. The attendance in proportion to the number of women in the club or group.
3. The activity of the individual members in civic affairs in their particular localities.

* * *

Between October and January the Women's Committee, Metropolitan New York Section, N. E. L. A., composed of one representative from each of the Metropolitan companies, held four regular monthly meetings. Several members of the committee acted as hostesses and the meetings were held in their respective company buildings. Each meeting was followed by an inspection trip of instructive value to the committee members. The inspection trips included:

East River Generating Station (The New York Edison Co.)
Edison Lighting Institute, Harrison, N. J.
Model Apartment — (Westchester Lighting Co.)
Modern Apartment—(The Yonkers Electric Light & Power Co.)

The committee members have held successful educational meetings in their individual companies. The following is a list of the subjects presented in talks to women employees at these meetings:

Electrical Appliances—Use and Care
Why Public Utilities Merchandise
Proper Lighting for the Home
Power Plant Operation
Safety
Preparation of Food by Use of Electric Refrigeration
Interior Decorating
Educational Courses for Women in Public Utilities
Telephone Courtesy
Why Women Work

In the various companies classes have been held, in which the following subjects were taken up:

Cooking by Electricity
Resuscitation (booklets on resuscitation have been widely distributed)
Educational Courses on Public Utility Information

The women employees have also taken inspection tours of educational value. These trips included:

Livingston Power Station (Staten Island Edison)
Modern Apartment (Yonkers Electric Light & Power Co.)
Model Kitchen (Staten Island Edison)
Women's Art & Industries Exposition
Electrical Show, Grand Central Palace

The following presentations at company meetings proved enjoyable as well as educational:

When the Whole World Electric Went on Strike
Wanted a Stenographer

* * *

The Women's Committee of the Southwestern Gas and Electric Co. held a six months' contest to determine the most useful and willing worker in each division of the group.

A careful record was kept of each girl's activities during the period; copies of all talks made were kept. At the end of the contest a summary of each girl's activities was compiled and copies of the talks made were attached to her record. The judges were the executives of the company.

The points on which the girls were graded each month were:

Attendance
Willingness
Faithfulness
Talks made
Preparation of talks
Voluntary work
Willingness to work after office hours
Work in standing committees
Participation in programs
General attitude and interest

The award was a trip to the geographic convention.

Miss Wingate, chairman of the Women's Committee of the Southwestern Gas and Electric Co. remarks on this contest as follows:

"The judges had the following to say in regard to the contest:

"'The reading of these papers was a revelation and a gratification to all the judges, more particularly to the writer, who has not heretofore been acquainted with work of this sort. I was particularly impressed by the fact that each lady who entered the contest was graded practically 100 per cent on her faithfulness and willingness.

"'I am convinced that if all the employees of the Southwestern Gas & Electric Co. have the same enthusiasm and loyalty for the company and the same idea of public relations, trouble with your public will be unknown.

"'You are to be heartily congratulated upon the success of the efforts you have put forth in training these young ladies.

"'The judges wish to express their appreciation of the splendid records as shown by these reports. The willingness of the individual members and the loyalty shown are things of which the company can well be proud. The papers submitted show unlimited study and preparation. We congratulate the Southwestern Gas & Electric Co. on its women employees.'

"It is the belief of those in charge of this work that the contest has been the means of developing the greatest per cent. of the members of each committee. All of the girls have taken a most active and interested part in the work, and have developed greatly in public speaking. Some have shown hitherto unknown ability for leadership, through their work on the program committee and other committees. All phases of the National program have been considered during this contest, and talks on safety, rural electrification, electricity in the home, home service, refrigeration, and economics have been given. We believe that we have a well informed group of employees in the Women's Committees of our company, and an organization upon which the company can depend for loyalty, courtesy, and intelligent furthering of the company's interests."

* * *

A feature of a report from the New England Division is a "Medley-Personal Efficiency" which was presented by the Women's Committee, Public Service Company of New Hampshire, at the 20th Convention of the New England Division last fall. It was arranged by Miss Grace A. Phillips, Company Chairman. Miss Edna Annis was the leader, assisted by Mrs. Marion Lander, Miss Madeline Whelan, Miss Ellen O'Keefe and Miss Ethel Achilles. Each one discussed a phase of personal efficiency. These talks are suitable Women's Committee program numbers. The complete medley has been printed in pamphlet form. Copy of the pamphlet will be sent upon request to the office of Secretary, Women's Committee, N. E. L. A., 420 Lexington Avenue, New York.

Miss Alice M. Baker, chairman of the Women's Committee, New England Division, was given a place on the program of the Commercial Section at this convention.

"Farm Electrification and Rates" is the topic of a talk given by Prof. E. W. Lehmann to the various division meetings of the Women's Committee of the Central Illinois Public Service Co. The pageant "Evolution of Lighting," has also been a feature of the meetings of these groups.

* * *

The February issue of *Current Topics,* published by the North American Light and Power Utility group, boasts a "Women's Page" with Miss Betty Ewing, Editor. There are pictures of the Women's Committee leaders of Illinois, Iowa and Kansas. Miss Ewing is the chairman of the Middle West Division Women's Committee.

* * *

At a recent meeting of the Women's Committee of the Public Service Co. of Northern Indiana, at Hammond, Mrs. Leila M. Blomfield of Chicago was the speaker. Her topic was "The Romance of Electric Power." She depicted in her talk the struggle of mankind to bring electricity into practical use and illustrated its advancement by colored stereopticon pictures. Guests at this meeting included officers of several Hammond women's business and professional clubs.

* * *

A report from West Virginia gives us the information that the Women's Committee at Huntington presented the playlet, "Electrified Eliza," before the Rotary Club of that city.

* * *

The activities of the Women's Committee in the East Central Division are many and varied. Miss Esther Rockey, of the Dayton Power & Light Co., Dayton, is chairman of this division. The Home Service Department of the Ohio Public Service Co., under the leadership of Mrs. Ella Smethers, is presenting excellent programs and carries on interesting activities. During the Vacation Bible School held in Ashland, women of the Ashland Division taught the children lampshade making during their recreation period. English has been included in the course of study of some of the divisions. Another interesting number was a demonstration of an electric washer sale on the Sales Floor of the Massillon Division in which one member of the committee took the part of a saleslady and another that of a colored customer. The Lorain Division has studied Parliamentary Law. The Cleveland Division visited the new building of the Ohio Bell Telephone Co. Outstanding work has been done by Miss Agnes Kalter of the Elyria Division. Miss Kalter holds a regular position in the Ohio Public Service Co., but has also developed and demonstrated her ability to carry on Home Service Work in that district. Members of the Elyria Women's Club have been entertained with bridge luncheons—an electric range demonstration being conducted before the meeting, the food prepared and placed in the oven, and after the guests are finished with their bridge game, the luncheon served. Miss Kalter also conducts demonstrations in customers' homes whether in cooking or better lighting in addition to her regular duties.

Most of the Home Service work done by the Ohio Public Service Co. has been developed through young women who have held regular positions with the company whether office, telephone or sales work.

* * *

According to *The Looking Glass* reflecting the Electrical Women's Round Table, Inc., of Greater New York, the Home Service Division of Westchester Lighting Co., Mrs. Cecil Harvey, director, with Miss Helen O'Brien and Miss Elizabeth Robbins, assistants, has given 94 lecture-demonstrations in the period between September and December, 1928. One of the features of this Home Service Department is a "Cooking Course for Brides." The Home Lighting Section, through its representatives, Mrs. Sarai Waugh and Miss Elizabeth Todd, has given 21 home lighting lectures during the same period.

* * *

"The Women CAN Sell Appliances" was the subject of an article regarding a one-month merchandise campaign, written by Miss Ethel Bilbrey, chairman, Women's Committee, Birmingham Electric Co., Birmingham, Ala., in a recent issue of *Electrical South.* In this sales campaign on electric table appliances and electric irons, approximately $3,000 worth of appliances was sold by committee members—200 in number.

MAGAZINE ARTICLES

BELOW IS A LIST of articles which appeared in various magazines recently that are especially interesting to Women's Committee members:

The Household Magazine—March.
  Modern Devices Banish Sir Dust—Harriet W. Allard.
  Electricity—The Chore Boy—Esther L. Service.
Modern Priscilla—March.
  The Value of Convenience Outlets—Eloise Davison.
  The Daily Round—Dishwashing—Margaret H. Hartnett.
McCall's Magazine—March.
  What of Your Ironing?—Anne Pierce.
Holland's—March.
  Lighting the Home for Comfort and Beauty—A. W. Roe.
Good Housekeeping—March.
  Plumbing That Meets Your Needs—George W. Alder.
Better Homes and Gardens—March.
  Versatile Waffles and Griddle Cakes—Nell B. Nichols.
House and Garden—March.
  Electrical Aids for the Home.
Sunset Magazine—March.
  Baking-Day Insurance—Dorothy E. Shank.

To Advertising and Public Relations Managers of Electric Light & Power Companies

Devote a few days to planning your contribution for winning the

FORBES
Public Service Cup

The cup will be awarded at the fifty-second convention of the National Electric Light Association.

PUBLIC SERVICE CUP
FORBES MAGAZINE
As winner of the first prize in a national contest for the most constructive public relations campaign carried on by a light and power company in local territory during the past year

Then—get it in shape and forward to us, before

MAY 1st

We will be glad to send you upon request the conditions governing this Contest if you have not already received them.

NEW YORK CITY

WHAT OCCURRED LAST MONTH

Consolidations

The Public Service Commission of Maryland has granted permission to the Empire Public Service Corporation to purchase for $418,000 the four Western Maryland electric companies concerning which litigation has been before the Commission and courts for the past two years. The present price is $50,000 less than the price proposed heretofore and which the Commission declared was exorbitant.

* * *

Announcement was made on March 13 that control of the Southern California Gas Corporation and of its operating subsidiaries has been acquired by the Pacific Lighting Corporation.

* * *

The Federal Trade Commission's Investigation

Resuming its hearings on publicity of the utilities, the Federal Trade Commission on March 13 heard testimony concerning the activities of the California Electrical Bureau, with Victor M. Hartley of San Francisco, Executive Secretary of the Bureau, as witness.

* * *

On March 14 the Federal Trade Commission heard further testimony of Victor M. Hartley of San Francisco, executive secretary of the California Electrical Bureau.

* * *

On March 15 the Commission transmitted to the Senate its Twelfth Interim Report on the investigation. This declares that during the period covered by the report the examination of the books of accounts of two holding company groups was completed and work begun on the operating companies of one of the groups. Field work on the relations between utility groups and service organizations was begun in the offices of two other holding company groups, the reports declare. It also mentions the filing of a brief in its case against the Electric Bond and Share Company and the hearings on March 13 and 14. The report also lists witnesses from the Pacific Coast who have been asked to appear on March 21, 27 and 28.

* * *

On March 20 the session of the Commission was devoted to the introduction of documents relating to the California measure to permit entry of the state into the public utility business, which has three times been defeated by the voters. No witnesses were called.

* * *

Hydro-Electric

A report of the Geological Survey says that on January 1, 1929, the total capacity of water wheels in hydro-electric plants of 100 horsepower or more was 13,571,000 horsepower, about 10 per cent more than on January 1, 1928.

* * *

A report by the Division of Water Resources and Engineering of North Carolina says that production of electricity by water and steam in North Carolina for 1928 was 2,265,544,000 kw.-hr. as compared with 2,086,534,000 in 1927. 2,037,974,000 kw.-hr., or 89.5 per cent of the total, was produced by water-power.

* * *

A dispatch from Seattle says that work on the 400,000 hp. hydro-electric plant at Priest Rapids on the Columbia River is to be started in the near future.

* * *

The Appalachian Electric Power Company announces that it is to spend $11,000,000 on a hydro-electric plant on the New River in Virginia.

* * *

The Senate Committee on Agriculture and the Public Lands Committee of the House have reported favorably the Shipstead-Newton Bill designed to prevent creation of reservoirs and erection of power dams in the Rainy Lake district, along the northern boundary of Minnesota.

* * *

The Federal Power Commission announced that it has referred to its legal staff the application of the Cumberland Falls Hydro-Electric Company for a license to construct a project at Cumberland Falls in Kentucky. The Commission, the statement says, desires an opinion concerning its jurisdiction on matters involved in the application, other than questions of navigation.

* * *

The Federal Power Commission, on March 1, approved a report submitted by its Executive Secretary, O. C. Merrill, recommending promulgation of an order requiring licenses of the Commission to file notice with the Commission of intention to issue securities in those cases where the Commission's jurisdiction exists and thereafter to leave to the determination of the Commission, in individual cases, whether it will or will not exercise its jurisdiction.

* * *

A dispatch from Brawley, California, says that a publicity-owned hydro-electric project for Imperial Valley is being urged by officials of the Imperial Irrigation District. The proposed project would make use of power-sites along the irrigation canals.

* * *

The Minnesota House of Representatives has before it a measure authorizing the state to acquire, develop and operate hydro-electric projects and to issue bonds for the same up to $50,000,000. Another bill before the House proposes an annual rental fee of 25c. per hp. on all water-power produced in the state.

* * *

A dispatch from Vancouver announces that the British Columbia Power Corporation is to construct a plant on the Campbell River, about a mile from its mouth, which will develop from 85 to 90,000 hp.

* * *

On March 9 the Philadelphia and Reading Coal and Iron Company announced plans for a dam across the Susquehanna River and a $6,000,000 electric power plant at Herndon, this being part of its plan to electrify its mining operations.

* * *

J. R. Cook, representative of the Ontario Government on the Ontario Hydro-Electric Commission, has presented to the Provincial Legislature proposals for further hydro-electric development involving 600,000 hp. on sites ranging from the Mississipi River to the upper Ottawa River. Mr. Cook predicts a power shortage within twenty years in spite of the maximum generating capacity of Niagara and the proposed development on the St. Lawrence and the Ottawa.

* * *

Production of Electric Current

The Department of Commerce, in an announcement saying that the production of electricity by public utility power-plants in January exceeded all previous monthly records, reaching a total of 8,219,000,000 kw.-hr., calls attention to the fact that this production was over twice the production during the entire year of 1905.

* * *

Rates

The president of the Syracuse, New York, Lighting Company announces that a reduction in gas and electric rates will be announced by the company not later than June 1 and perhaps by May 1.

* * *

The Narragansett Electric Lighting Company has announced a new rate-schedule, effective April 1, for Providence, which is expected to save customers at least $70,000 a year. The new initial rate will be five cents.

* * *

The Iowa Supreme Court has decided in favor of the town of Mapleton in its suit to compel the Iowa Public Service Company, which furnishes electric service in Mapleton in competition with the municipal plant, to raise its rates.

* * *

The Nebraska Power Company has announced voluntary reductions in residential rates for Omaha, which are expected to mean a saving to customers of about $200,000 annually. The initial rate is to be 5½c., which will apply to an amount equal to 10 kw.-hr. per room, per month. For the next 160 kw.-hr., the price will be 3 cents and for all above that 1½ cents. The old rate was 5½ cents straight.

The Standard Gas and Electric Company announces that rate-reductions totaling approximately $4,820,000 annually were placed in effect in 1928 or announced for the near future by subsidiary and affiliated companies.

* * *

Reduced commercial lighting rates for Meadville, Pennsylvania, mean a saving of not less than $6,000 a year to consumers.

* * *

Regulation

A bill introduced in the Indiana Legislature authorizes cities owning utility plants to enter into a contract for a period of not more than twenty-five years for wholesale purchase of service from an outside company, or to lease their plants to a private corporation for not more than twenty-five years.

* * *

A bill introduced in the Iowa Legislature authorizes organization of rural utility districts. It does not permit purchase of generating plants, but sanctions purchase or construction of distribution systems receiving current from private or municipal plants.

* * *

The Kansas House has adopted a bill, already passed by the Senate, providing that appeals from orders of the State Public Service Commission shall be taken to the district courts in the counties in which the orders are applicable.

* * *

The Nebraska Senate has defeated a bill requiring payment in cash when municipal utilities are sold.

* * *

A bill has been introduced in the Maryland Legislature to give authority to the Public Service Commission over electric energy imported from other states. The Maryland Assembly has defeated the bill calling for election, rather than appointment, of the members of the Commission.

* * *

The Ohio Senate has passed a bill repealing the Pence Law, which permits Ohio utilities to put rate-increases into effect prior to a ruling by the Public Service Commission. The bill has been sent to the House.

* * *

The Indiana Senate, by a vote of 36 to 8, has passed the Moorhead Bill, bringing utility holding companies under the jurisdiction of the Indiana Commission.

* * *

The Wisconsin Legislature has before it a bill declaring natural scenic beauty to be a public right and giving the Railroad Commission authority to withhold a water-power permit where it finds the construction, operation or maintenance of the proposed project contrary to such public right.

* * *

Home rule of public utilities by municipalities with a population of 2500 or more is called for in a resolution introduced in the Kansas Legislature.

The Missouri House has defeated a bill calling for a state commission to make a survey of water-power resources and to recommend legislation on the subject.

* * *

The Nebraska Legislature is considering a proposal to allow municipal plants to build as far as twenty-five miles outside city lines to serve customers.

* * *

The Committee on Power and Light of the Massachusetts Legislature has been holding hearings on the bill sponsored by the Massachusetts Department of Public Utilities, which is intended to bring public utilities into a contractual relationship with the state and to cause utilities to accept rate rulings by the Department without an appeal to the courts.

* * *

The Vermont Legislature has defeated the bill which sought to impose a tax on electric energy.

* * *

A bill to prevent new rate-schedules from becoming effective until final action by the Public Service Commission has been introduced in Pennsylvania. Heretofore the rule has been that schedules become effective thirty days after being filed.

* * *

On March 6, the Public Utilities Committee of the Ohio House of Representatives recommended for passage the bill repealing the Pence Law, which permits public utilities to put rates into effect pending sanction of them by the Public Utilities Commission.

* * *

The Indiana House of Representatives has defeated, by indefinite postponement, the Moorhead Bill, which had for its purpose the bringing of investment or holding companies under the jurisdiction of the Public Service Commission.

* * *

A bill introduced in the Wisconsin House prohibits utilities from generating electric current from streams in Wisconsin and transmitting the power outside of the state to be sold at a lower rate than the same company gives Wisconsin users.

* * *

A bill has been introduced in the Missouri Senate forbidding electric and gas companies to charge penalties for failure to pay bills on time. A bill in the Missouri House declares 7 per cent upon the fair value of property to be a lawful rate of return for utilities.

* * *

The Public Utilities Committee of the Kansas Senate has brought in a resolution directing the Public Service Commission to conduct an investigation and survey of gas and electric rates in Kansas and to make an adjustment of the rate structure.

* * *

The Committee on Conservation and Reclamation of the Texas House of Representatives has reported adversely a bill to revoke permits granted by the State Board of Water Engineers for dams across public streams on which construction work had not been completed Jan. 1, 1929. The proposed bill would have affected a number of hydro-electric projects.

* * *

The North Dakota House has defeated a bill to appropriate for a survey of public utilities in the state by the Board of Railroad Commissioners, and has passed a bill to provide uniform procedure for assessment of utilities.

* * *

The Legislature of the State of Washington has before it a bill providing that all electric current sold in the state would be subject to a tax of one mill per kw.-hr.

* * *

The Joint Committee on Water Power of the Maine Legislature has been holding hearings on bills which would permit the export of electric current.

* * *

West Virginia's newly-enacted water-power law includes a section reconciling the positions of those opposing and favoring export of electric current by providing that under all licenses, except those of railway corporations, licensed for their own use, the reasonable needs of consumers in the state who can reasonably be served by the licensee shall have preference. It is thought that the new law will encourage hydro-electric development in the state.

* * *

The North Carolina Senate has passed an education bill, which calls for an increase in the tax on gross receipts of power companies from 1 to 2 per cent.

* * *

Ohio has passed the bill repealing the Pence Law, which permitted public utilities to put rates into effect pending sanction by the Public Utilities Commission. The new law provides for a Fact Finding Committee as a division of the Utilities Commission. This committee is to have a superintendent who is to be appointed by the Commission.

* * *

The Oklahoma House has passed a bill authorizing municipalities to own and maintain property outside of corporate limits, and to issue bonds against this property.

* * *

The Michigan Senate has passed the Rushton Bill, requiring gas and electric companies to secure a certificate of convenience and necessity in certain cases.

* * *

The Minnesota Legislature has defeated the proposal to bond the state for the purpose of developing water power up to the amount of $50,000,000.

* * *

St. Lawrence

Prime Minister King of Canada, in a statement in the House of Commons, has declared that it will be at least several months before Canada can begin negotiations with the United States for a treaty on joint development of the St. Lawrence waterway. Mr. King said negotiations could not be started until there was complete accord between the Federal Government and the Provinces of Ontario and Quebec as to their respective rights in the matter of ownership of power developed as the result of developments for navigation purposes.

* * *

On March 12, Governor Roosevelt of New York submitted to the Legislature his plan for development of St. Lawrence power, which calls for appointment by the Governor, with the consent of the Senate, of a board of trustees, which would prepare a definite plan for generation of power by the state and distribution, if possible, by private companies, this to be submitted to the Legislature for ratification.

* * *

The Dominion Government at Ottawa has approved plans of the Beauharnois Light, Heat and Power Company, already sanctioned by the Province of Quebec, to build a power canal and accompanying hydro-electric works between Lakes St. Louis and St. Francis in the St. Lawrence River, twenty miles from Montreal. The company plans a development of 500,000 hp. The agreement provides that the company is to turn the canal over to the Canadian Government at any time, should the government wish to use it as a part of the greater St. Lawrence waterway.

* * *

On March 19, a bill embodying Governor Roosevelt's recommendation for the creation of a Board of Trustees to plan for and handle development of the St. Lawrence hydro-electric resources, was introduced in the Senate and House of the New York Legislature by Democratic leaders.

* * *

Sub-Metering

The Public Utilities Commission of the District of Columbia has decided that owners of large buildings will not be permitted to purchase electricity at wholesale rates and retail it to their tenants.

* * *

Real estate interests of New York City continue to oppose abolition of sub-metering. A report prepared by two New York real estate organizations claims that abolition of sub-metering will cause building owners a loss of $10,000,000 a year.

LEGISLATION

Status, at Close of Seventieth Congress, of Legislation of Interest to Public Utilities

Boundary Water Measures.

The Federal Government gave its consent to compacts on boundary water disputes between the following States:

New Mexico and Oklahoma respecting the waters of the Cimarron River and others (H. R. 6496)

New Mexico, Oklahoma and Texas respecting waters of all streams in which such States are jointly interested (H. R. 6497)

New Mexico and Arizona (H. R. 6499)

Colorado and New Mexico (H. R. 7024)

Colorado, Oklahoma and Texas (H. R. 7025)

[Colorado and Utah (H. R. 7028) passed the Senate with amendments; these were not agreed to and the bill failed.]

Bus Regulation.

Identical bills (S. 5085 and H. R. 15621) for the regulation of interstate commerce by motor vehicles were prepared by the Senate and House Committees, introduced by the respective chairmen, and referred to the committees for formal report. Neither bill, however, was reported out of committee.

Boulder Dam.

The Swing-Johnson Bill (H. R. 5773) providing for construction of Boulder Dam, the development for sale of power, etc., subject to State compacts, became a law Dec. 21, 1928.

Columbia Basin Development.

The original Columbia Basin development bill (S. 1462) was changed and passed by the Senate, so as to provide for an investigation and survey of the possibilities of the project. This bill was favorably reported by the House Committee. On a motion to suspend the rules and pass the bill the necessary two-thirds was not secured, and the bill failed.

Communications Commission.

The Watson bill (S. 5104) proposing to create a Federal Communications Commission, was not acted on by the Interstate Commerce Committee.

Deschutes Project.

The bill (S. 1186) to provide for the construction of the Deschutes project in the State of Oregon was passed by the Senate and favorably reported by the House Committee. No further action was taken. The similar House Bill (H. R. 307) was not reported.

District of Columbia Street Railway Merger.

A compromise bill (S. J. Res. 208) was reported by the Senate Committee in the closing days of the Congress. An identical bill (H. J. Res. 406) was also reported in the House. The Senate bill was given a preferred position, but was not reached.

Federal Power Commission.

The bill (H. R. 8141) to increase the personnel of the Federal Power Commission was favorably reported by the House Committee on Interstate and Foreign Commerce, but was defeated on the floor of the House. The companion Senate bill (S. 1606) was not acted upon by the Senate Committee on Commerce, to which it was referred.

The Hull bill (H. R. 15575) amending the Federal Water Power Act, was introduced at the second session and referred to the House Interstate and Foreign Commerce Committee. No action was taken on it. The author sent his explanation together with the bill to all States for comment.

Federal Trade Commission.

The total sum appropriated for the Federal Trade Commission for the fiscal year 1930 was $1,277,760. Of the total amount appropriated, $250,000 was made immediately available for use in the utilities inquiry. (According to the report of the House Appropriations Committee this represents an increase for this year of $229,760 traceable to the utilities inquiry). In addition, $70,240 was carried in the Second Deficiency Appropriation bill to supply Federal Trade Commission deficiencies for the fiscal year 1929.

Flathead Indian Reservation.

The 1930 Interior Department Appropriation Bill provided $10,000 for operation and maintenance of the power distributing system in 1929, together with $40,000 for the construction of laterals near Roman. These amounts to be taken from the $395,000 previously authorized.

The Second Deficiency Bill, 1929, provided a total of $220,000 for various construction work and further provided that any portion remaining should become applicable during the fiscal years 1929 and 1930 to the construction of power transmission lines and the purchase of power if and when license for the development of power on the Flathead River shall have been issued by the Federal Power Commission as provided in the Act of March 7, 1928 (45 Stat., pp. 212, 213).

Flood Control Surveys.

The House flood control bill (H. R. 13484) was enacted, authorizing preliminary examinations of sundry streams with a view to the control of their floods, improvement of navigation and economical development and utilization of water power.

Injunctions.

A subcommittee of the Senate Judiciary Committee prepared a bill to replace the Shipstead anti-injunction bill. Hearings were held but the the bill was not reported. (S. 1482.)

The House Judiciary Committee held

hearings on the House bills (H. R. 7759 and H. R. 10082) but took no action.

Interior Department Appropriation Bill.

The Department of Interior Appropriation Bill (H. R. 15089) carries several items under Bureau of Reclamation and Indian Service providing funds for construction and operation of power plants and in some cases transmission lines for various purposes. (See Flathead Indian Reservation, San Carlos Reservation-Coolidge Dam, herein, as examples.)

Limitation of Jurisdiction of District Courts.

The Norris Bill (S. 3151) was favorably reported by the Judiciary Committee and put on the calendar but was not acted on by the Senate. No action has been taken on the Wagner bill (S. 4491).

Lobby Bills.

The Caraway bill (S. 1095), providing for the registration of lobbyists, passed the Senate at the first session of Congress. Hearings were held by a subcommittee of the House Judiciary Committee, but the bill was not reported.

Muscle Shoals.

The Norris-Morin Muscle Shoals Corporation bill was pocket vetoed. Validity of this veto will be determined in analogous case to be argued before the Supreme Court March 11.

The Madden Bill (H. R. 8305), embodying the Cyanamid offer, was reported to the House by the Military Affairs Committee. The Rules Committee did not report a rule for its consideration. Majority and minority reports were filed by Representative Reese and by Representative Morin, chairman of the committee.

Niagara Falls Treaty.

A resolution (S. Res. 333) introduced by Senator Borah was adopted by the Senate on Feb. 26. It authorized the Senate Committee on Foreign Relations to investigate the subject of the convention and protocol between the United States and the King of Great Britain for the preservation and improvement of the scenic beauty of the Niagara Falls and Rapids concluded at Ottawa on Jan. 2, 1929.

Radio.

The White Bill (H. R. 15430) was adopted by both houses after being amended to extend the life of the Federal Radio Commission to Dec. 31, 1929. Proposed restrictive provisions affecting public utility radio stations were not adopted.

Rivers and Harbors.

The River and Harbor Bill (H. R. 14066) was reported by the House Committee during the first session of the Congress. It was not pressed for passage.

San Carlos Reservation (Coolidge Dam).

Funds previously made available for construction of a transmission line, including substation, from the Coolidge Dam is further made available for pumping plants, purchase of equipment, etc.

St. Lawrence Waterway.

A bill (H. R. 5613) by Representative Mapes of Michigan, providing for a deep waterway between the Great Lakes and the St. Lawrence, by way of the Welland Canal, and accompanied by reports from the State, War and Treasury Departments, was not acted upon.

State Regulation of Distribution of Electric Energy.

A bill (S. 3920) for such regulation where the transmission or disposition is in interstate or foreign commerce was introduced by Senator Tyson in the first session of the Congress. No action by the Senate Interstate Commerce Committee.

Umatilla Rapids Development.

The bill introduced by Senator McNary (S. 1187) was not reported by the Senate Committee on Irrigation and Reclamation. Hearings were held.

The House Bill (H. R. 306) was favorably reported by the House Committee but was objected to when reached on the Consent Calendar. No rule was obtained.

NOTE: A special session of the 71st Congress has been called by the President to convene on April 15, 1929.

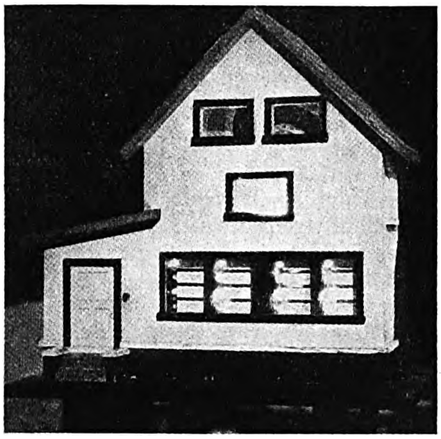
THE IDEA MILL

Novel Safety Bulletin

By A. F. LEMMON

Safety Supervisor Blackstone Valley Gas & Electric Co., Pawtucket, R. I.

TO attract attention to safety matters in a somewhat unusual way, an illuminated bulletin board in the shape of a miniature house was recently built out of scrap material by the substation department of this company in the spare time of the men. The bulletin is mounted on an outdoor platform near the shipping division at the Pawtucket service station, and its main features consist of sets of windows in which are displayed disks and messages which appear according to predetermined sequence upon the pressing of a button at the side of the miniature doorway. The upper windows reveal a revolving colored disk to call attention to the display, the middle window contains a 3-in. x 4-in. card display and the lower window contains thirteen spaces representing the different sections of the distribution department.



When the button is pushed miniature lamps behind red and green glass buttons above the thirteen departmental sections are energized, crews free from accidents in a stated period being spotted by green lights. The colored disk at the top of the house revolves and the lower disk turns one-twelfth of a revolution, bringing a new message card into view in the middle window. The colored disk stops revolving when the card reaches the reading position, and after an interval the disk resumes rotation and other cards are brought into view until a set of twelve has been exposed.

A Tip for Manufacturers

THE City of Stockholm has set an excellent example for American cities. Its house numbers are to be illuminated at night.

It is a reform which has been urged and discussed there for many years, as it has been by a great many individuals and communities in this country. Recently, however, cab drivers and physicians have complained so vigorously that definite action is to be taken by municipal authorities.

Illuminated numbers at night imply visible numbers in the daytime. There are times when a person looking for a building in a strange neighborhood feels despairingly that nothing short of the millennium will correct the hopeless situation that exists in so many places —invisible house numbers, or none at all.

If Stockholm can put over this reform, cities on this side of the Atlantic should be able to do so.—Editorial, *Yonkers, N. Y., Statesman.*

Correction

ON page 128 of the February N. E. L. A. BULLETIN the review of the serial report "Progress in Generator Design and Practice" erroneously credited the report to the Prime Movers Committee. The report was prepared by the Electrical Apparatus Committee.

Picked up from

ELECTRICAL NEWS ITEMS

Issued weekly by Department of Public Information, National Electric Light Association, 420 Lexington Avenue, New York City. All or part may be used without further notice and with or without credit being given.

Electricity and Vitamins

THE average business man of today, taking little exercise in the winter, could not have kept his efficiency to a high degree had he not been able to purchase a year round diet rich in vitamins. This has been made possible, according to A. J. Authenreit, vice-president of the Middle West Utilities Co., because of refrigerated vegetable and fruit shipments.

In discussing the development of electric refrigeration, Mr. Authenreit told the Midwest Power Engineering Conference at its recent meeting in Chicago, that the electricity consumed for cold storage equals 310 million kilowatt-hours and that the small electric refrigerators that are growing in popularity for home use and moderate sized commercial refrigerators consume 630 million and 584 million kilowatt-hours respectively.

How great this business has become in the last few years was revealed by the figures quoted. The number of cars of meats sent out under refrigeration is 300,000 a year. While undoubtedly most of these cars are cooled with either natural or manufactured ice the tendency is toward electric refrigeration. Cooled ships and trains make it possible to bring in 64 million bunches of bananas from the tropics. All cars containing perishables kept with ice numbered 975,000 and the ice they consumed reached 12½ million tons.

Cost of Generation

THE total cost of generating electricity, states the Salt River Water Users' Association in a recent number of the *Associated Arizona Producer*, is only 10 per cent of the total cost of electric service to its rural customers. Furthermore, a wide spread of rates for electricity for various classes of consumers, varying from 7/10 of one cent to 12 cents per kilowatt-hour, is entirely justifiable.

In announcing a new schedule for retail power service, the Water Users' Association calls attention to the fact that the average rate paid on consumers' lines is estimated to be composed of the following essential items.

	Per cent of total power costs
Generation	10.1
Transmission	5.1
Distribution	84.8

"Power," says the *Associated Arizona Producer*, "must be on the line to supply current whenever it is needed. The interest on the big investment in the power system, the operation and maintenance costs and other overhead expenses go on 100 per cent of the time, nevertheless, so such a use of power must necessarily pay a rate which will cover the cost of holding the power in readiness as well as the power actually consumed. . . .

"It may be assumed that the present rates are as nearly equitable as six months' careful study can make them. They are adjusted on the theory that the association will, after all costs of service are deducted, get the same net price for its power, whether used in large bulk such as for mining at a 7/10 cent rate, or in the smallest quantities for lighting at a 12 cent rate. The wide difference in these rates is simply a matter of difference in cost of service. The big factor in cost to small users is the cost of distribution, which amounts to 85 per cent of what the consumers pay."

Electrified Fox Farms

IT is easier to feed foxes when your farm is electrified, is the conclusion voiced by George Banzhaf of Milwaukee, who manages an extensive fox farm in Manistique, Mich. Mr. Banzhaf conducts his business on a large scale and sells his pelts every year in the New auction rooms.

A mixture of horse meat and stale bread, with a slight proportion of other ingredients, is the main dish offered to the hundreds of foxes that are kept in pens until late in the spring when they are allowed to run in the large fenced enclosure. When the business was started, about four years ago, with a few animals, the food was prepared by hand, but modern methods have been installed since electricity has been put on the pay roll.

When the horses are killed—about 200 are required during the year—they are frozen solid in a large electric refrigerating chamber and cut into blocks with an electric saw, after which the blocks, hard as wood, are stacked in a cold storage room. As they are needed, the blocks are gradually thawed, to prevent the meat from becoming black, and the bones are removed.

The next stage in the preparation of this food is to pulverize the bone in one machine and grind the meat in another. In proper proportions these are then transferred to a mixer, constructed much in the manner of a large bread mixer in a modern bakery, and then the bread and other ingredients, such as salt and some medicines, are added. The stale bread, purchased from bakeries in Milwaukee and Manistique, has been finely ground on the floor above the mixing room by another electric contrivance, and it comes down a chute to be added to the bone and meat. Salt and a few other things are put into the mixer, the switch is thrown and the resulting product, for bigger and better foxes, resembles so much hamburger steak. "And the foxes like it," says Mr. Banzhaf, "and this way of preparing the food assures a properly balanced diet that is clean and thoroughly mixed."

Needless to say, the people that work on this novel farm also enjoy the benefits of electrification. Although four miles from the nearest town, the house has a host of labor-saving appliances that would do credit to the average city home. The driveway is lighted every night and large floodlights have been installed to enable the fox-farmers to watch their pens at night, for foxes are valuable and must be guarded from thieves and marauders.

"It would not be possible," says Mr. Banzhaf, "to operate this enterprise with our present staff if it were not for the constant aid and efficiency of our electrical machines. We are not promoting a menagerie but are actively in the business of raising animals for fur. Electricity is a big asset."

Electric Traffic Checker for Holland Tube

AN electric traffic checker registers every automobile passing through the Holland Tunnel that connects New York and New Jersey. According to *Forbes Magazine*, a small floodlight is mounted in an inclined position upon the overhead ironwork of the exit. A slender beam from the light falls upon a small circular window in a box placed beneath the sidewalk at the opposite side of the roadway.

The box contains a sensitive photoelectric tube, an amplifying tube and an electrical relay. When a vehicle passes, the beam is interrupted. The photoelectric tube is affected, so that a slight electrical impulse results. This is amplified by the vacuum tube and fed to the relay, energizing a transmission circuit, the other end of which is in the commission's office. A dial there, actuated by the electric current, registers another figure in response to each impulse from the relay.

The Holland Tunnel is also making use of adaptations of the Televox principle by centralized control devices for stopping traffic, fire alarms, etc.

THE REVIEWING STAND

Electric Power Survey of Ohio, West Virginia and Kentucky.

By Power Survey Committee, East Central Division, N. E. L. A., 59 pages, with numerous illustrations, graphs and maps. Single copies, $1 each. Five or more, 50 cents each. Order from D. L. Gaskill, secretary, East Central Division, N. E. L. A., 603 Broadway, Greenville, Ohio.

"HITHERTO," wrote Gen. George Washington, "the people of the western country, having no excitements to industry, labor very little." This was in 1784. Times have changed somewhat, and the leisurely West which he was describing is the great region which now composes the states of Ohio, West Virginia, and Kentucky, and the western counties of Pennsylvania.

In less than 150 years it has become the seat of the heaviest industries in all the world; the home of steel, coal, automobiles, and electric power; peopled by upwards of 12,000,000 persons; bound together by railroads, broad highways, and telephones; one of the most intensely integrated economic provinces on earth.

It is with these well chosen sentences that the first section entitled "The East Central Division and Its Resources" is introduced.

The second section of this survey devotes several pages to a discussion of "Industry and Power in the East Central Zone." The important economic position held by the East Central territory is clearly brought out here by interesting data on Transportation, Agriculture, Manufacturing, Mines and Quarries, and Electric Power.

The "Economic Background of the States" is the title of the third section of the survey and it deals with the relation of the volume of electricity used to the degree of advancement of the region served. Further it shows how the inherent natural resources of the region have influenced the growth of the electric power industry in the region. In the report's own words, "The volume of electricity generated and transmitted depends upon the degree of advancement of the region, and this in turn upon many factors. By making available the large resources of interconnected power, electricity reduces local singularity, breaks down isolation, and makes available to all communities, in some degree, the advantages of the most favored. The effect of the large-scale provision of electric power, over the course of many years, is likely to be in the direction of spreading out and evening up the regional development."

Section four sets forth "The Value of Electric Service" to the East Central territory and shows how it has played a very important part in the realization of "cheap power."

"Planning the Electrical Supply" is the subject matter for several pages of the survey. Speaking of the responsibilities of the electric industry it says, "Three important interests have always to receive consideration; the public as users of the companies' service, the investors as owners of their stocks and bonds, and the employes who actually perform the work of serving the public. By examining the grave responsibilities placed on the power companies, it may be apparent that economic studies, such as 'power surveys,' play an important part in planning for the future."

Under the heading "Interconnection with the Iron and Steel Industry," the advantages of such interconnection are pointed out thus: "The ultimate objective would be to conserve all the heat and heating agents produced in the blast furnaces and steel mills. Whatever could not be used in the mills could be converted into electric power and absorbed by the power companies. Their systems are so large and widespread that they can market all the by-product power thus produced. Any shortage of power in the mills, at any time, can be made up by the central stations, the same as two central-station companies equalize their peaks by exchanging power."

Under the caption, "Electricity for the Railroad," the survey calls attention to the fact "that power lines are practically as numerous as rail lines and touch the same places. Many of them parallel much the same routes. Central-station power can be had wherever wanted by the railroads. The problem of power supply is not as great as that of equipping the railroad right-of-way for its utilization. Power companies can prepare for the delivery of power much faster than the railroads can get ready to use it."

Other subjects discussed at length are "The Financing of Electric Service," "Interconnection of Power Companies," "Electricity for Industry," "Electricity for the Farm."

Section twelve, "The East Central Division in 1950" discusses probable population and electric energy load conditions twenty years hence.

"The population of the Division in 1920 was 9,639,700," says the survey. "By 1950 it is estimated that it will have increased to 13,240,400. The population of the territory covered by the survey was 12,799,400 in the last census. By 1950 the figure for this area will probably be 17,558,800. The populations per square mile will be 126 and 137 respectively, an increase of about 36 per cent for each in the 30-year period.

"There will be, in 1950, about 3,630,000 families in the area, nearly all of whom should be supplied with electricity and about one-seventh with electric ranges. It is estimated that the average annual residence consumption should be 850 kilowatt-hours, or 2,350 kilowatt-hours where ranges are used. The consumption per range is estimated to be about the same as today, but the other domestic uses are considered to be much greater than today. The combined result should be about 224 kilowatt-hours per capita for residence service.

"All estimates taken together indicate, for the Power Survey Territory, total annual sales for all purposes of nearly 2,600 kilowatt-hours per capita. The production will have to be more than 3,000 per capita on account of losses in transmission and distribution. The total generation will be about 53 billion kilowatt-hours or two-thirds as much as the output for the United States in 1927. The power station capacity required with the superior load factor expected at that time is 12,000,000 kilowatts or 16,000,000 horsepower. This is about half the capacity that existed in American public utility power stations at the end of 1926. All of these figures are stated more exactly in the tables."

"Present and Future," the title of section thirteen augments and amplifies the discussion in section twelve with valuable tables.

At the end of the report are a group of very useful maps covering the East Central territory and showing distribution of population (1920 and 1950), power stations in 1928 (5,000 Kw and larger), transmission lines in 1928 (66,000 V and above), trunk lines and generating centers (1950), and individual maps of the states of Ohio, Kentucky and West Virginia, showing all electric service and transmission lines.—V. W. Palen.

Standard Wiring for Electric Light and Power—1929. By H. C. Cushing.

H. C. Cushing, Jr., 15 West 55th Street, New York, N. Y. 501 pages. Price, $3.00.

THE thirty-fifth edition of Standard Wiring for Electric Light and Power is now available. This edition represents a complete revision of this standard work. The sections on illumination, which includes the Franklin Specification, the Red Seal Plan, metering, appliances and materials, all have received careful consideration and reflect the most up-to-date practices. The sections on the Red Seal Plan and illumination should be of particular value to all who are interested in adequate wiring and proper illumination. The 1928 Code, which was not approved as an American standard, has been used as a basis for the rules concerning grounding. The grounding rules in the 1928 edition of the National Electrical Code have been reconsidered, and changes have been made since the book went to press. However, the other sections mentioned above, together with a very complete set of useful tables, make the book generally worth while.—A. B. MORGAN.

HALFORD ERICKSON, Byllesby Engineering & Management Corp., Chicago, Ill.

P. G. GOSSLER, Columbia Gas & Electric Corp., New York, N. Y.

A. R. GRAUSTEIN, International Paper Co., New York, N. Y.

FRANKLIN T. GRIFFITH, Portland Electric Power Co., Portland, Ore.

C. E. GROESBECK, Electric Bond & Share Co., New York, N. Y.

EDWIN GRUHL, The North American Co., New York, N. Y.

A. F. HOCKENBEAMER, Pacific Gas & Electric Co., San Francisco, Cal.

MARTIN J. INSULL, Middle West Utilities Co., Chicago, Ill.

SAMUEL INSULL, Commonwealth Edison Co., Chicago, Ill.

WALTER H. JOHNSON, The Philadelphia Electric Co., Philadelphia, Pa.

W. A. JONES, Henry L. Doherty & Co., New York, N. Y.

JOHN W. LIEB, The New York Edison Co., New York, N. Y.

THOMAS W. MARTIN, Alabama Power Co., Birmingham, Ala.

THOMAS N. MCCARTER, Public Service Electric & Gas Co., Newark, N. J.

JOHN B. MILLER, Southern California Edison Co., Los Angeles, Cal.

SIDNEY Z. MITCHELL, Electric Bond & Share Co., New York, N. Y.

THOMAS E. MURRAY, Thomas E. Murray, Inc., New York, N. Y.

J. J. O'BRIEN, H. M. Byllesby & Co., Chicago, Ill.

J. F. OWENS, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

R. F. PACK, Northern States Power Co., Minneapolis, Minn.

A. W. ROBERTSON, Westinghouse Electric & Manufacturing Co., New York, N. Y.

MARSHALL E. SAMPSELL, Central Illinois Public Service Co., Chicago, Ill.

H. T. SANDS, Electric Bond & Share Co., New York, N. Y.

PAUL A. SCHOELLKOPF, The Niagara Falls Power Co., Niagara Falls, N. Y.

M. S. SLOAN, The New York Edison Co., New York, N. Y.

FRANK W. SMITH, The United Electric Light & Power Co., New York, N. Y.

R. P. STEVENS, Allied Power & Light Corp., New York, N. Y.

FRANK M. TAIT, The Dayton Power & Light Co., Dayton, Ohio.

A. W. THOMPSON, West Chestnut Avenue, Chestnut Hill, Philadelphia, Pa.

GEORGE N. TIDD, American Gas & Electric Co., New York, N. Y.

HERBERT A. WAGNER, Consolidated Gas, Electric Light & Power Co., Baltimore, Md.

OWEN D. YOUNG, General Electric Co., New York, N. Y.

Public Relations National Section Representatives

JOHN F. GILCHRIST, Commonwealth Edison Co., Chicago, Ill.

T. A. KENNEY, Allied Power & Light Corp., New York, N. Y.

GUY W. TALBOT, Pacific Power & Light Co., Portland, Ore.

GEOGRAPHIC DIVISIONS STATE ASSOCIATIONS

CANADIAN DIVISION

(*Entire Dominion of Canada*)

Canadian Electrical Association

President, P. S. GREGORY, The Shawinigan Water & Power Co., Montreal, Can.; *Secretary*, H. M. LYSTER, Room 712, Power Bldg., Montreal, Can.

(*This Division Has No State* [*Provincial*] *Section*)

*EASTERN DIVISION

(*New Jersey, New York, Pennsylvania*)

President, F. R. PHILLIPS, Duquesne Light Co., Pittsburgh, Pa.; *Managing Director*, A. B. MILLAR, Telegraph Bldg., Harrisburg, Pa.

Empire State Gas and Electric Association

President, CHARLES S. RUFFNER, Mohawk-Hudson Power Corp., Albany, N. Y.; *Secretary*, CHARLES H. B. CHAPIN, 5618 Grand Central Terminal Bldg., New York, N. Y.

New Jersey Electric Association

President, C. H. HOWELL, Atlantic City Electric Co., Atlantic City, N. J.; *Secretary*, S. F. DELANY, Atlantic City Electric Co., Atlantic City, N. J.

Pennsylvania Electric Association

President, F. R. PHILLIPS, Duquesne Light Co., Pittsburgh, Pa.; *Managing Director*, A. B. MILLAR, Telegraph Bldg., Harrisburg, Pa.

EAST CENTRAL DIVISION

(*Kentucky, Ohio, West Virginia*)

President, C. S. MACCALLA, Pennsylvania-Ohio Power & Light Co., Youngstown, Ohio; *Secretary-Treasurer*, D. L. GASKILL, 603½ Broadway, Greenville, Ohio.

Kentucky Association of Public Utilities

President, SAMUEL RIDDLE, Louisville Railway Co., Louisville, Ky.; *Secretary*, E. F. KELLY, Louisville Railway Co., Louisville, Ky.

Public Utilities Association of West Virginia

President, A. C. SPURR, Wheeling Traction Co., Wheeling, W. Va.; *Secretary*, A. BLISS MCCRUM, Box 1483, Charleston, W. Va.

GREAT LAKES DIVISION

(*Illinois, Indiana, Michigan, Wisconsin*)

President, J. E. JOHNSON, Illinois Power & Light Corp., Chicago, Ill.; *Secretary*, TOM C. POLK, 910 Marquette Bldg., Chicago, Ill.

Illinois State Electric Association

President, JULIUS L. HECHT, Public Service Co. of Northern Illinois, Chicago, Ill.; *Secretary-Treasurer*, GEORGE W. SCHWANER, 205 Illinois Mine Workers Bldg., Springfield, Ill.

Indiana Electric Light Association

President, NORMAN A. PERRY, Indianapolis Power & Light Co., Indianapolis, Ind.; *Secretary-Treasurer*, WILLIAM STOKES, 1548 Consolidated Bldg., Indianapolis, Ind.

Michigan Electric Light Association Section

President, HOWARD PETT, Consumers Power Co., Jackson, Mich.; *Secretary-Treasurer*, HERBERT SYLVESTER, The Detroit Edison Co., Ann Arbor, Mich.

Wisconsin Utilities Association

President, C. R. PHENICIE, Wisconsin Public Service Corp., Green Bay, Wis.; *Executive Secretary*, JOHN N. CADBY, Room 203, University Bldg., 432 Broadway, Milwaukee, Wis.

*MIDDLE ATLANTIC DIVISION

(*To Consist of Delaware, District of Columbia, Maryland, Virginia*)

Maryland Utilities Association

President, H. T. CONNOLLY, Washington, Baltimore & Annapolis Electric Railroad Company, Baltimore, Md.; *Secretary*, D. E. KINNEAR, United Railways & Electric Company, Baltimore, Md.

Public Utilities Association of Virginia

President, A. W. HIGGINS, Virginia Public Service Co., Charlottesville, Va.; *Secretary*, A. B. TUNIS, 301 East Grace Street, Richmond, Va.

Middle West Division

(Iowa, Kansas, Missouri, Nebraska)

President, Ralph T. Smalley, Kansas Electric Power Co., Lawrence, Kan.; *Managing Director*, Thorne Browne, 1527 Sharp Bldg., Lincoln, Neb.

Iowa Section

President, C. S. Macy, Iowa Power & Light Co., Adel, Iowa; *Secretary-Treasurer*, H. E. Weeks, Tri-City Railway & Light Co., Davenport, Iowa.

Kansas Section

President, Frank M. Stone, Kansas Utilities Co., Fort Scott, Kan.; *Secretary*, H. Lee Jones, 820 Kansas Avenue, Topeka, Kan.

Missouri Association of Public Utilities

President, A. E. Reynolds, Springfield Gas & Electric Co., Springfield, Mo.; *Secretary-Treasurer*, F. D. Beardslee, 315 North Twelfth Street, St. Louis, Mo.

Nebraska Section

President, C. W. Amidon, Central Power Co., Grand Island, Neb.; *Managing Director*, Thorne Browne, 1527 Sharp Bldg., Lincoln, Neb.

New England Division

(Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont)

President, Irvin W. Day, The Connecticut Light & Power Co., Waterbury, Conn.; *Secretary*, Miss O. A. Bursiel, Room 1113 Statler Bldg., 20 Providence Street, Boston, Mass.

(This Division Has No State Sections)

North Central Division

(Minnesota, North Dakota, South Dakota)

North Central Electric Association

President, L. M. Pharis, Minnesota Power & Light Co., Duluth, Minn.; *Secretary*, John W. Lapham, 803-804 Plymouth Bldg., Minneapolis, Minn.

(This Division Has No State Sections)

Northwest Division

(Alaska, Idaho, Montana, Oregon, Utah, Washington)

Northwest Electric Light and Power Association

President, R. M. Boykin, Pudget Sound Power & Light Co., Seattle, Wash.; *Secretary*, Berkeley Snow, Room 1206, Spaulding Bldg., Portland, Ore.

(This Division Has No State Sections)

Pacific Coast Division

(Arizona, California, Hawaii, Nevada, Philippine Islands)

Pacific Coast Electrical Association

President, Paul M. Downing, Pacific Gas & Electric Co., San Francisco, Cal.; *Secretary*, Samuel H. Taylor, Suite 729-730, 447 Sutter Street, San Francisco, Cal.

Arizona Utilities Association

President, M. A. Pooler, Tucson Gas, Electric Light & Power Co., Tucson, Ariz.; *Secretary*, L. C. McCullough, 134 South Central Avenue, Phoenix, Ariz.

Rocky Mountain Division

(Colorado, New Mexico, Wyoming)

President, Clare N. Stannard, Public Service Co. of Colorado, Denver, Colo.; *Secretary*, O. A. Weller, Public Service Co. of Colorado, Denver, Colo.

The Colorado Utilities Association

President, V. L. Board, Public Service Co. of Colo., Denver, Colo.; *Secretary*, O. A. Weller, Public Service Co. of Colo., Denver, Colo.

New Mexico Utilities Association

President, W. W. Nielsen, New Mexico Power Co., Santa Fe, N. M.; *Secretary-Treasurer*, Bernard L. Wiles, Albuquerque Gas & Electric Co., Albuquerque, N. M.

Wyoming Utilities Association

President, W. D. Johnstone, Mountain States Power Co., Casper, Wyo.; *Secretary*, F. A. Probst, Mountain States Telephone & Telegraph Co., Casper, Wyo.

Southeastern Division

(Alabama, Cuba, Florida, Georgia, North Carolina, South Carolina, Tennessee, Porto Rico)

President, C. A. Collier, Georgia Power Co., Atlanta, Ga.; *Secretary*, C. M. Kilian, 207-8 Bona Allen Bldg., Atlanta, Ga.

Southwestern Division

(Arkansas, Louisiana, Mississippi, Oklahoma, Texas)

President, J. G. Holtzclaw, Gulf States Utilities Co., Beaumont, Tex.; *Secretary*, S. J. Ballinger, San Antonio Public Service Co., San Antonio, Tex.

Arkansas Utilities Association

President, W. E. Bann, Southwestern Gas & Electric Co., Texarkana, Tex.; *Secretary*, R. I. Brown, Arkansas Central Power Co., Little Rock, Ark.

Mississippi Electric League

President, A. H. Jones, Jones-Johnson Co., McComb, Miss.; *Secretary*, A. R. Riddick, A. G. Riddick, Inc., Jackson, Miss.

Oklahoma Utilities Association

President, L. W. Scherer, United Telephone Corp., Watonga, Okla.; *Secretary*, Edward F. McKay, 1020 Petroleum Bldg., Oklahoma City, Okla.

Southwestern Public Service Association

President, W. H. Burke, Stone & Webster, Inc., Houston, Tex.; *Secretary*, E. N. Willis, 403 Slaughter Bldg., Dallas, Tex.

***Note: This Division is in Process of Formation.**

SECTIONS, BUREAUS AND COMMITTEES

Chairmen's names only listed here

Special National Committees

Advertising Committee—Frank Leroy Blanchard, Henry L. Doherty & Co., New York, N. Y.

Charles A. Coffin Prize Committee—P. S. Arkwright, Georgia Power Co., Atlanta, Ga.

Codes and Standards Committee—Irvin W. Day, The Connecticut Light & Power Co., Waterbury, Conn.

Constitution and By-Laws Committee—R. F. Pack, Northern States Power Co., Minneapolis, Minn.

Electrification of Steam Railroads Committee—Britton I. Budd, Public Service Co. of Northern Illinois, Chicago, Ill.

Exhibition Committee—E. W. Goldschmidt, Wagner Electric Corp., New York, N. Y.

Finance Committee—Sidney Z. Mitchell, Electric Bond & Share Co., New York, N. Y.

Lamp Committee—Frank W. Smith, The United Electric Light & Power Co., New York, N. Y.

Prize Awards Committee—W. H. Onken, Jr., *Electrical World*, New York, N. Y.

Public Policy Committee—R. H. Ballard, Southern California Edison Co., Los Angeles, Cal.

Rate Research Committee—L. R. Nash, Stone & Webster, Inc., Boston, Mass.

Water Power Development Committee—Paul A. Schoellkopf, The Niagara Falls Power Co., Niagara Falls, N. Y.

Wiring Policy Committee—J. E. Davidson, Nebraska Power Co., Omaha, Neb.

General National Committees

***Civic Development Committee**—John B. Reynolds, Middle West Utilities Co., Chicago, Ill.

***Educational Committee**—Fred R. Jenkins, Commonwealth Edison Co., Chicago, Ill.

***Insurance Committee**—W. H. Sawyer, Allied Power & Light Co., New York, N. Y.

***Membership Committee**—Howard K. Mohr, The Philadelphia Electric Co., Philadelphia, Pa.

***Rural Electric Service Committee**—Charles F. Stuart, Northern States Power Co., Minneapolis, Minn.

Accounting National Section

***Section's Executive Committee**—J. F. Ford, The Philadelphia Electric Co., Philadelphia, Pa.

Budget Committee—B. S. Rodey, Jr., The United Electric Light & Power Co., New York, N. Y.

***Classification of Accounts Committee**—H. C. Hasbrouck, H. C. Hopson & Co., New York, N. Y.

Corporate Finance Committee—O. E. McCormick, Middle West Utilities Co., Chicago, Ill.

***Customers' Records Committee** — Douglas Brown, New York & Queens Electric Light & Power Co., Long Island City, N. Y.

***Fixed Capital Committee**—J. A. Rockwood, Portland Electric Power Co., Portland, Ore.

***General Records Committee**—K. B. Crumb, American Gas & Electric Co., New York, N. Y.

***Purchasing and Storeroom Committee**—W. G. Young, New York & Queens Electric Light & Power Co., Long Island City, N. Y.

***Statistics Committee**—Harry A. Snow, The Detroit Edison Co., Detroit, Mich.

Commercial National Section

***Section's Executive Committee**—Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

***Commercial and Industrial Power and Heating Bureau**—V. M. F. Tallman, Charles H. Tenney & Co., Boston, Mass.

Commercial Cooking Committee—O. Wilhelmy, The Union Gas & Electric Co., Cincinnati, Ohio.

Electric Truck Committee—Guy W. Thomas, Public Service Co. of Colorado, Denver, Colo.

General Power Committee—H. C. Thuerk, Erie Lighting Co., Erie, Pa.

Industrial Heating Committee—J. L. Faden, The Edison Electric Illuminating Co., Boston, Mass.

***Lighting Bureau**—T. O. Kennedy, The Ohio Public Service Co., Cleveland, Ohio.

Commercial and Industrial Lighting Committee—J. Daniels, The Edison Electric Illuminating Co., Boston, Mass.

Electrical Advertising Committee—C. J. Eaton, Middle West Utilities Co., Chicago, Ill.

Home Lighting Committee—W. T. Blackwell, Public Service Electric & Gas Co., Newark, N. J.

Street Lighting Committee—R. J. Malcomson, Public Service Co. of Northern Illinois, Chicago, Ill.

***Merchandising Bureau**—Frank D. Pembleton, Public Service Electric & Gas Co., Newark, N. J.

Domestic Electric Range Committee—F. A. Coupal, Buffalo, Niagara & Eastern Power Corp., Buffalo, N. Y.

Merchandise Sales Committee—C. L. Harold, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

Refrigeration Committee—C. L. Dunn, The Ohio Public Service Co., Cleveland, Ohio.

Water Heating Committee—Norman T. Wilcox, Stone & Webster, Inc., Boston, Mass.

***Customer Relations Committee**—H. T. East, Public Service Co. of Northern Illinois, Chicago, Ill.

Promotional Rates Committee—E. W. Lloyd, Commonwealth Edison Co., Chicago, Ill.

***Wiring Sales Committee**—A. P. Good, Commonwealth Edison Co., Chicago, Ill.

Engineering National Section

***Section's Executive Committee**—E. C. Stone, Duquesne Light Co., Pittsburgh, Pa.

***Accident Prevention Committee**—C. R. Beardsley, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

***Electrical Apparatus Committee**—J. A. Johnson, The Niagara Falls Power Co., Niagara Falls, N. Y.

Engineering Administration Committee—H. P. Liversidge, The Philadelphia Electric Co., Philadelphia, Pa.

***Hydraulic Power Committee**—Byron E. White, Utica Gas & Electric Co., Utica, N. Y.

***Inductive Coordination Committee**—H. L. Wills, Georgia Power Co., Atlanta, Ga.

***Meter Committee**—E. E. Hill, The New York Edison Co., New York, N. Y.

***Overhead Systems Committee**—Harold Cole, The Detroit Edison Co., Detroit, Mich.

***Power System Engineering Committee**—L. W. W. Morrow, *Electrical World*, New York, N. Y.

***Prime Movers Committee**—E. B. Ricketts, The New York Edison Co., New York, N. Y.

Special Engineering Research Committee—C. F. Hirshfeld, The Detroit Edison Co, Detroit, Mich.

***Underground Systems Committee**—J. W. Sylvester, The Philadelphia Electric Co., Philadelphia, Pa.

PUBLIC RELATIONS NATIONAL SECTION

***Section's Executive Committee**—J. F. OWENS, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

***Cooperation with Educational Institutions**—CARL D. JACKSON, 36 West 44th Street, New York, N. Y.

***Customer Ownership**—W. H. HODGE, Byllesby Engineering & Management Corp., Chicago, Ill.

***Industrial Relations Committee**—HOMER E. NIESZ, Commonwealth Edison Co., Chicago, Ill.

***Information Bureau Organizations Committee**—T. A. KENNEY, Allied Power & Light Corp., New York, N. Y.

Manufacturers' Advertising Committee—T. J. MCMANIS, General Electric Co., Schenectady, N. Y.

***Public Speaking Committee**—W. S. VIVIAN, Middle West Utilities Co., Chicago, Ill.

***Relations with Financial Institutions Committee**—A. W. ROBERTSON, Westinghouse Electric & Manufacturing Co., New York, N. Y.

***Women's Committee**—MISS SOPHIA MALICKI, Middle West Utilities Co., Chicago, Ill.

***Provision is made for a representative from each Geographic Division.**

CONVENTIONS AND MEETINGS

Meeting of the Section, Bureaus and Committees of the National Electric Light Association are shown in roman type; those of other associations in italics

1929

April

1–2 Industrial Heating Conference, Great Lakes Power Club, University of Michigan, Ann Arbor, Mich.

3 *New York Electrical Society, New York, N. Y.*

5 Commercial Section, Great Lakes Geographic Division, Detroit, Mich.

12 Maryland Utilities Association, Emerson Hotel, Baltimore, Md.

4–13 *Home Complete Exposition, Indiana State Fair Grounds, Indianapolis, Ind.*

17–18 *National Warm Air Heating and Ventilating Association, Indianapolis, Ind.*

17–19 Engineering Section, Pacific Coast Geographic Division, Fresno, Cal.

18–20 Engineering Section, Great Lakes Geographic Division, Drake Hotel, Chicago, Ill.

18–20 Arizona Utilities Association, Tucson, Ariz.

21–23 *American Society of Civil Engineers, Dallas, Texas.*

22–26 *American Welding Society, Engineering Societies Bldg., New York, N. Y.*

24–26 Middle West Geographic Division, Hotel Fontenelle, Omaha, Neb.

29–30 *Chamber of Commerce of the U. S. A., Washington, D. C.*

30 Southwestern Geographic Division, Hot Springs, Ark.

30 Arkansas Utilities Association, Hot Springs, Ark.

May

2 *American Trade Association Executives, Mayflower Hotel, Washington, D. C.*

1–3—Southwestern Geographic Division, Hot Springs, Ark.

1–3 Arkansas Utilities Association, Hot Springs, Ark.

1–3 *Chamber of Commerce of the U. S. A., Washington, D. C.*

1–3 *Indiana Public Utilities Association, Hotel Gary, Gary, Ind.*

1–3 Indiana Electric Light Association, Hotel Gary, Gary, Ind.

1–3 *Indiana Gas Association, Hotel Gary, Gary, Ind.*

7–9 *American Institute of Electrical Engineers, Regional Meeting, Dallas, Texas.*

7–10 East Central Geographic Division, Brown Hotel, Louisville, Ky.

8–10 Southeastern Geographic Division, Asheville, N. C.

13–15 *American Society of Mechanical Engineers, Rochester, N. Y.*

13–16 *National Fire Protection Association, Memphis, Tenn.*

13–16 *National Fire Protection Association, Memphis, Tenn.*

13–24 Industrial Heating School, Case School of Applied Science, Cleveland, Ohio.

20–25 *National Electrical Manufacturers Association, The Homestead, Hot Springs, Va.*

27–31 *National Electrical Wholesalers Association, The Homestead, Hot Springs, Va.*

27–31 *General Federation of Women's Clubs, Swampscott, Mass.*

31 Commercial Section, Great Lakes Geographic Division, Indianapolis, Ind.

June

3–7 Annual Convention and Exhibition, NATIONAL ELECTRIC LIGHT ASSOCIATION, Municipal Auditorium, Atlantic City, N. J.

10–15 *Westinghouse Agent-Jobber's Association, The Homestead, Hot Springs, Va.*

14 *Board of Directors, Society for Electrical Development, New York, N. Y.*

16–18 North Central Geographic Division, Breezy Point Summer Resort, Pequot, Minn.

18–21 *Society of Automotive Engineers, New York, N. Y.*

19–21 Canadian Geographic Division, Algonquin Hotel, St. Andrews-by-the-Sea, N. B.

19–22 Pacific Coast Geographic Division, Del Monte, Cal.

20–21 Accounting Section, Wisconsin Utilities Association, Sheboygan, Wis.

24–28 *American Society for Testing Material, Atlantic City, N. J.*

24–28 *American Institute of Electrical Engineers, Swampscott, Mass.*

26–29 Northwest Geographic Division, Seattle, Wash.

July

1–4 *American Society of Mechanical Engineers, Salt Lake City, Utah*

1–5 *American Home Economics Association Convention and Exhibition, Statler Hotel, Boston, Mass.*

18–19 Electric Section, Wisconsin Utilities Association, Hotel Wausau, Wausau, Wis.

August

27–30 *National Association of Railroad and Utilities Commissioners, Glacier National Park Hotel, Glacier National Park, Mont.*

September

4–6 Pennsylvania Electric Association, Bedford Springs Hotel, Bedford Springs, Pa.

9–11 Rocky Mountain Geographic Division Hotel Colorado, Glenwood Springs, Colo.

9–12 New England Geographic Division, Hotel Griswold, New London, Conn.

9–13 *American Society for Steel Treating, Cleveland, Ohio.*

19–20 Empire State Gas and Electric Association, Saranac Inn, Saranac Lake, N. Y.

28–30 *American Electric Railway Association Convention and Exhibit, Atlantic City Auditorium, Atlantic City, N. J.*

30 *National Safety Council, Stevens Hotel, Chicago, Ill.*

October

1–4 *American Electric Railway Association Convention and Exhibit, Atlantic City Auditorium, Atlantic City, N. J.*

1–4 *National Safety Council, Stevens Hotel, Chicago, Ill.*

14–18 *American Gas Association, Atlantic City, N. J.*

NEW MEMBERS

Electric Light and Power Companies (Class A)

Colorado, Denver, The Arvada Electric Company

Colorado, Springfield, Highland Utilities Company

Illinois, Chicago, North Continent Utilities Corporation

Maine, Lewiston, Androscoggin Electric Company

Minnesota, Elk River, Elk River Power & Light Company

Montana, Great Falls, Great Northern Utilities Company

Nebraska, Scottsbluff, Missouri Service Company

New Mexico, Socorro, New Mexico Public Service Company

Pennsylvania, Oil City, Keystone Public Service Company

Pennsylvania, Waterford, Waterford Electric Light Co.

Vermont, Chester, Chester Power & Light Co., Inc.

Vermont, Pittsford, Allied Vermont Utilities, Inc.

Canada, St. John New Brunswick, St. John River Power Company

Canada, Sask., Regina, Dominion Electric Power, Limited

Employees of Electric Light and Power Companies (Class B)

Alabama, Birmingham, Alabama Power Company
- W. E. Baldwin
- Mrs. Jessie M. Hunter (Montgomery, Ala.)

California, Los Angeles, Los Angeles Gas & Elec. Corp.
- C. B. Heisler (Alhambra, Calif.)
- William B. Hickok
- Frank H. Streit (So. Pasadena, Calif.)

California, San Francisco, Pacific Gas & Electric Co.
- Alfred Anderson
- James S. Bunnell (Sacramento, Calif.)
- Robert Grutzmacher
- C. E. Haglund (Emeryville, Calif.)
- E. R. McNee
- William C. Macy
- W. H. Park

California, San Francisco, Peoples California Hydro-Electric Corp.
- Frank E. Bregdon (Fort Bragg, Calif.)
- Paul Madison (Fort Bragg, Calif.)

Colorado, Denver, Public Service Company of Colorado
- V. M. McDonald (Leadville, Colo.)
- Henry A. Mitchell

Colorado, Springfield, Highland Utilities Company
- F. A. Hadel
- Thos. White (Farmington, New Mexico)

Delaware, Wilmington, Delaware Power & Light Company
- G. W. Cannon

Idaho, Boise, Idaho Power Company
- Elmer G. Adams
- Roy Calhoun (Jerome, Idaho)
- L. H. Hoppes (Jerome, Idaho)
- A. W. Jacomini (Shoshone, Idaho)
- H. H. Kerfoot (Hazelton, Idaho)
- F. H. Pollard (Wendell, Idaho)
- Lee Pursley (Jerome, Idaho)
- A. A. Woodhead (Gooding, Idaho)

Illinois, Chicago, Commonwealth Edison Company
- Miss Margaret A. Regan

Illinois, Chicago, North Continent Utilities Corporation
- W. A. Baehr
- William B. Baehr
- E. R. Foster
- R. B. Meredith
- J. W. Sykes
- A. C. Winters

Illinois, East St. Louis, East St. Louis Light Light & Power Co.
- Miss Ida M. Spies

Illinois, Peoria, Central Illinois Light Co.
- Henry E. Brickner
- T. F. Steenrod (E. Peoria, Ill.)

Iowa, Cedar Rapids, Iowa Railway & Light Corporation
- Miss Louise Hathaway

Iowa, Fort Dodge, Fort Dodge Gas & Electric Company
- Mark Anderson

Iowa, Mason City, Peoples Gas and Electric Company of Oswego
- Fred W. Hanley (Oswego, N. Y.)

Iowa, Sioux City, McGraw Electric Company
John A. Martin (Minneapolis, Minn.)

Kansas, Lawrence, Kansas Electric Power Company
M. C. Blackstun (Bonner Springs, Kansas)
A. W. Johnson (Leavenworth, Kansas)

Louisiana, New Iberia, Gulf Public Service Company
Clifford J. Schexnayder

Maine, Portland, Cumberland County Power & Light Company
Miss Frances E. Googins (Biddeford, Maine)
Miss Estelle R. MacElveny

Massachusetts, Boston, New England Power Company
Howard A. Hands
R. E. Shillady
Walter A. Sutphen

Massachusetts, Boston, Charles H. Tenney & Co.
James B. Arthur
Ambrose L. Kerrigan
Donald B. McGuire (Melrose, Mass.)

Massachusetts, Cambridge, Cambridge Electric Light Company
Carl M. Glidden (Waverly, Mass.)

Massachusetts, Haverhill, Haverhill Electric Company
H. S. Brasseur

Massachusetts, Lawrence, Lawrence Gas & Electric Co .
George Frost
Maurice Johnson
E. G. Twohey

Massachusetts, Revere, Suburban Gas & Electric Company
William J. Conners

Michigan, Detroit, The Detroit Edison Company
B. S. Aldrich
J. S. Ambrose
H. M. Armstrong
F. N. Baker (Port Huron, Mich.)
E. A. Baldwin
N. Ballbach
M. A. Barbour
F. J. Barnes
V. S. Barretta (Wyandotte, Mich.)

Michigan, Detroit, The Detroit Edison Company
C. H. Bay
F. W. Benstein
C. H. Best (Port Huron, Mich.)
N. Bowman
B. Brant
W. E. Brennan
Miss Georgena M. Brock
Lloyd H. Brydon
H. G. Carrow (Dearborn, Mich.)
D. Coddington (Trenton, Mich.)
Henry A. Cook
Herbert E. Cook
Sabin Crocker (Mt. Clemens, Mich.)
H. C. Davies (Northville, Mich.)
John B. Dempsey
H. Donner
L. Fishbeck
T. B. Fitzgerald
J. H. Flessner (Monroe, Mich.)
F. J. Flom
H. Foote (River Rouge, Mich.)
S. M. Fraser
Wm. P. French
A. P. Fugill
Miss Ethel Giffin
Leslie Gilmore (Utica, Mich.)
George Glass
Jo. A. Graves
Boyd Griffin (Port Huron, Mich.)
W. E. Groves (Birmingham, Mich.)
Hubert Guest (Ann Arbor, Mich.)
D. L. Hadley
L. K. Harris
D. A. Heilman (Fordson, Mich.)
William Heimbuch
E. Hewitt (Ypsilanti, Mich.)
W. A. Hirt
H. O. Hostetter
O. A. Hunter (Wayne, Mich.)

Guide to This Issue

THE FIFTY-SECOND CONVENTION AND EXHIBITION, 261

The Convention will furnish a grand climax for several other related events to be held in Atlantic City. Many notables will take part in Convention program. An outline of what will occur during Convention week.

BUSINESS PROGRAM FOR CONVENTION, 266

WHY THEY WENT IN 1890, 268

Very much the same things drew conventioneers in the gay '90's as they do now. But, you could get breakfast at 6 o'clock in the morning at the 1890 Convention and the afternoon session lasted until 7 o'clock.

AMPLIFIER CONSIDERS CONVENTIONS, 269

A seasoned convention attendant philosophizes on the why's and wherefore's of conventions. He concludes that among the major values of a convention is the opportunity for renewing friendships and acquaintanceships among men all engaged in the same kind of effort, with the chances for discussion of mutual interests.

THIS IS ATLANTIC CITY, 273

Clifton H. Howell

The General Manager of the Atlantic City Electric Company tells about "The Playground of the World" and its relation to the Convention. He answers two questions which have been repeatedly asked him: "Why is Atlantic City going to all the expense of taking so much time and trouble to do honor to Mr. Edison and the electrical industry?" and "How can a city of 65,000 people build and maintain a $12,000,000 Auditorium?"

PRESIDENT HOOVER TO HEAD LIGHT'S GOLDEN JUBILEE COMMITTEE, 276

An outline of the nation wide celebration to honor Mr. Edison. The 50th Anniversary of the invention of the practical incandescent lamp bids fair to be the greatest golden jubilee the world has ever celebrated.

BEHIND THE VEIL: THE PHILOSOPHER'S STONE, 277

Ernest Greenwood

The second of a series which portrays against a social historic background the evolution of the electrical industry and the chief personalities that have been instrumental in its growth. In this installment the period between the Golden Age of Greece and the Elizabethan Age is bridged.

COOPERATIVE COMPETITION, 283

C. Ernest Greenwood

Cooperative Competition is predicated on the policy that the power company is primarily interested in the total appliance business done in the community in which it operates, and not only in the appliances sold by its merchandising department. It is presented as a sound merchandising practice for building the domestic appliance load.

CASHOCKA! 285

Ed Drier

A tale of bass fishing in the Muskegon River and what a power company did for the sportsmen.

INDUSTRIAL ELECTRIC HEAT, 287

B. M. Riker

A digest of the paper which won the James H. McGraw first prize for 1927-28.

THE WESTINGHOUSE LAMP COMPANY'S NEW LIGHTING INSTITUTE, 290

A. E. Allen

The Institute, which opens June 1st, is designed as an educational institution for the study and teaching of correct lighting practice and as a meeting place for all who are interested in the application of artificial illumination to the modern arts and sciences.

CORRESPONDENCE FOR GOOD WILL, 291

James F. Rice

Details of how one large public utility company systematically improved the quality of its business letters. The business letter is a prime factor in customer relations and not merely an item of secondary importance in the daily grind of an industry's busy wheels.

Departments

Service Suggestions

See "Correspondence for Good Will," page 291 noted above.

Interpretations of Electrical Development

CURRENT STATISTICS ON THE ELECTRIC LIGHT AND POWER INDUSTRY, 296

BASIC INFORMATION ON THE LIGHT AND POWER INDUSTRY, 297

THE COST OF LIVING AND DOMESTIC ELECTRICITY, 297

The price of household electricity is now but one-third of what it was in 1890, although the cost of living is two and one-half times what it was at that time. The constant decrease in home electricity exemplifies the principles of lowered cost with increase in greater diffusion of service.

THE PRESIDENT'S PAGE

Convention

EVENTS are transpiring which should make our Fifty-second Convention and Exhibition the most colorful, entertaining, and valuable of any that have ever been held.

Atlantic City is preparing a great celebration to mark the inauguration of Light's Golden Jubilee in honor of Mr. Edison and the Fiftieth Anniversary of the invention of the practical incandescent lamp, and, as a compliment to the electrical industry, the formal opening of the Atlantic City Auditorium will be on May 31st to coincide with the opening of our Exhibition. In these exercises such eminent figures as Vice-President Curtis, Sir Esme Howard, British Ambassador, and Don Alejandro Padilla y Bell, Spanish Ambassador, will take part.

The Exhibition will be by far the largest ever held. It will be located in an ideal setting, filling the entire floor space and stage of the mammoth main hall of the Auditorium.

Distinguished speakers who are leaders in their fields will discuss the subjects of greatest and immediate importance to the electrical industry and to the general public.

On this occasion the industry will pledge anew its obligations to civilization.

Not alone will the executives of our member companies benefit from attendance and participation in the convention, but so will every employee who may have the opportunity to attend.

Without doubt every higher executive who can possibly make his arrangements to attend will be there, but it is for the younger men and women that I wish to make a special plea. None can attend without returning to his duties with a broadened vision of the greatness of the work he is engaged in, his personal obligations to it, and his and the industry's duties to the Commonwealth. In addition he will carry away information of tangible value in the efficient administration of his work.

Every member company is urged to have at the Convention as strong a representation as is possible.

P S Arkwright
President.

N·E·L·A· BULLETIN

Science and the machine, in brief, are not things toward which any of us can afford to take a snooty attitude.—*Henry Hazlitt.*

"What a man does for himself dies with him; what he does for his community lives forever."

How You May Help

WHILE the collateral events of the Convention, including the Exhibition, Atlantic's City's celebration of her Diamond Jubilee, the initial festivities of Light's Golden Jubilee, and the varied entertainment provided for Convention delegates, will be much greater than at any previous convention, they will be so arranged that they will not conflict with the Business Sessions.

The morning sessions will convene promptly at 10 o'clock, the afternoon sessions at 3 o'clock, and the Public Policy Session on Thursday morning at 8.30 o'clock. As these sessions will be called to order promptly at the hours stated, the cooperation of delegates in seating themselves a few moments before the meetings are called to order so that the first speaker of each session may not be disturbed by late comers will be greatly appreciated by the Convention Committee. Such thoughtfulness will greatly aid in the effective discharge of our Business Program and make for a thoroughly successful convention.

In this issue of the Bulletin are a number of articles that should be read by everyone who expects to attend the Convention. There is a general article which briefly outlines the main events of the Convention and Exhibition, tells of the speakers on the Business Program and gives other information that will be useful to the delegate.

C. H. Howell, General Manager of the Atlantic City Electric Company, writes entertainingly of the part the city will play in the Convention, while the Bulletin's philosopher, The Amplifier, will help create a proper frame of mind to get the most enjoyment and benefit from the Convention. The invitation to a convention of the 90's, which was culled from our records, will no doubt bring up many bright memories to our older members, and give to the younger ones a glimpse of life in less hurried days.

Power Distribution

A DETAILED analysis of the distribution of the power produced by the electric utility enterprises is of interest as emphasizing the part played by industrial and commercial electrification in the disposal of the country's energy supply. Eliminating those power houses whose output is devoted entirely to railway use, the output of the electric light and power plants may be divided roughly as follows:

	Per cent
Sold for domestic service	10
Sold for commercial light	7½
Sold for commercial power	56
Sold for traction	6½
Total sold	80
Used by company itself (a)	3½
Lost and unaccounted for	16½
Total generated, plus procured from enterprises not public utilities and imported from Canada	100

Note (a)—Used in the gas, water or traction departments of companies operating composite enterprises and for lighting companies' offices, etc.

It is thus evident that industrial power is the preponderating item in the disposition of the output of the electric power houses, and future plans, as well as present characteristics, will be predicated to a great extent upon the future developments, not of the electric light and power industry itself, but of the manufacturers of the nation.

Historically speaking, the initial purpose of electric service was for light and traction. Both of these have the unfortunate habit of having the same peak hour. The result was the formation of a period of maximum demand between five and six o'clock, and this demand determined the amount of generating machinery installed. The net result was that much of this installed machinery was idle for all but a small part of the day. In cities where commerce and trade—as distinguished from what is usually termed "heavy manufacture" — predominate, the type of curve which represents this situation still persists.

Here we find it rising sharply as the day's work begins, a little peak in the forenoon when all factories are working, a slight drop during the lunch hour, a rise again during the afternoon, with a sudden and dizzy height at five o'clock when the store and home lights are turned on and the traction lines begin to cope with the evening rush hour. This consolidated curve constitutes the most pronounced instance of the "five o'clock peak," and its shape has an important bearing upon the possible competition of water power with steam generated electricity.

On the other hand, in those communities where manufacturing predominates, the curve is quite different.

The peak no longer comes at five o'clock with the turning on of lights; it may come between nine and ten o'clock in the morning or between two and three in the afternoon. Where electrolytic or electro-metallurgical loads have been built up, it even tends to approximate a straight line.

N·E·L·A·
BULLETIN

May, 1929 Vol. XVI No. 5

The 52nd Convention and Exhibition

Several Other Celebrations in Atlantic City Will Add to Its Interest

THE 52nd Convention of the National Electric Light Association, beginning Monday, June 3, and lasting through Friday, June 7, will furnish a grand climax for several other related events to be held in Atlantic City.

The Exhibition, to be held in conjunction with the Convention, opens Friday, May 31; the dedication ceremonies of the Atlantic City Auditorium—where the Convention and Exhibition will be held—will be on May 31; and the initial celebrations of Light's Golden Jubilee, as well as festivities marking the Diamond Jubilee of Atlantic City, will take place convention week. Each of these events, separately, would attract great crowds to the seaside resort, but taken together they are expected to strain the capacity of Atlantic City's hotels.

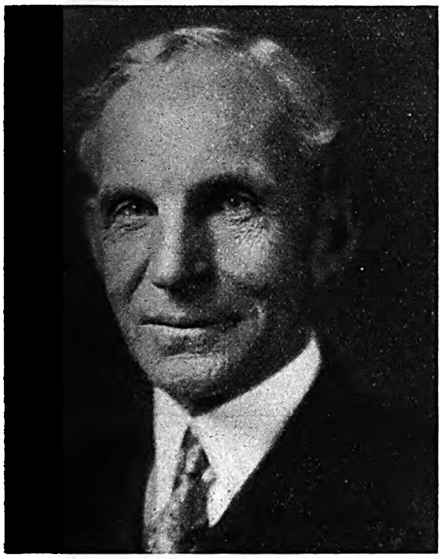
At the business sessions of the Convention, on which a great deal of time and thought have been placed, men who have won distinction in other fields of endeavor will be heard, as well as those of outstanding prominence in the electrical industry. Among the subjects that will be in the forefront for discussion are regulation, industrial development, research, rate making, commercial opportunities, accounting practices of the utilities, public relations, engineering developments, and the Federal Trade Commission's investigation of the electrical industry.

P. S. ARKWRIGHT

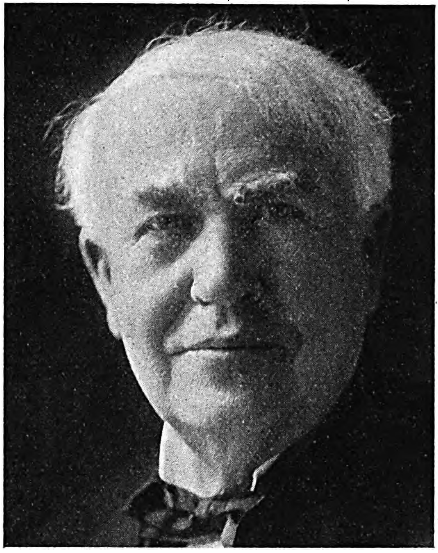
President, National Electric Light Association

Among those who will take part in the program are: Preston S. Arkwright, President of the N. E. L. A.; Julius H. Barnes, former President of the United States Chamber of Commerce; W. W. Freeman, President of the Union Gas and Electric Company; George D. Gibbs, Gibbs and Hill; J. J. Carty, Vice-President, American Telephone and Telegraph Co.; W. J. Hagenah, Vice-President, Byllesby Engineering and Management Corporation; A. W. Robertson, Chairman of the Board, Westinghouse Electric and Manufacturing Co.; J. F. Owens, Chairman of Public Relations National Section N. E. L. A.; R. F. Pack, former President of the N. E. L. A.; Paul S. Clapp, Managing Director of the N. E. L. A.; Britton I. Budd, President of the Public Service Co. of Northern Illinois; E. C. Stone, Chairman of the Engineering National Section, N. E. L. A.; Marshall E. Sampsell, Chairman of the Commercial National Section, N. E. L. A.; M. S. Sloan, President of the New York Edison Co.; E. W. Goldschmidt, Chairman of the Exhibition Committee; W. H. Onken, Jr., Senior Editor of the *Electrical World;* John W. Lieb, Vice-President of the New York Edison Co.; Charles L. Edgar, President of the Edison Electric Illuminating Co. of Boston; Thomas N. McCarter, President of the Public Service and Gas Co.; Berton Braley, author and poet; J. F. Ford, Chairman of the Accounting National Section, N. E. L. A.; J. R. Howard, past President of the American Farm Bureau Federation; J. L. Madden, Vice-President of the Metropolitan Life Insurance Co.; W. L. Ransom, of Whitman, Ransom, Coulson & Goetz; Bernard F. Weadock, Special Counsel before the Federal Trade Commission; A. C. Marshall, Vice-President of the Detroit Edison Co.; F. R. Phillips, President of the Duquesne Light Co.; B. C. Forbes, editor of *Forbes Magazine.*

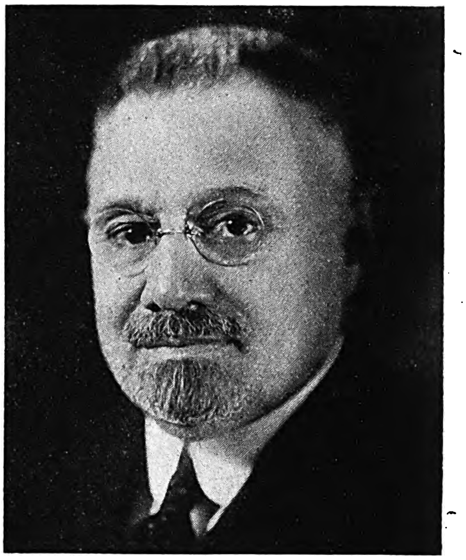
The general session for Thursday will be in the nature of a tribute from the industry to Thomas A. Edison. Mr. Edison is expected to appear both in



HENRY FORD
Ford Motor Car Company



THOMAS A. EDISON
Citizen of the U. S. A.



JOHN W. LIEB
Vice-President, New York Edison Company

person and in a talkie-movie. Henry Ford will also be on the speakers' platform to do honor to Mr. Edison. Messrs. Charles L. Edgar, Thomas N. McCarter, John W. Lieb and Berton Braley will be the principal speakers at this session.

The reader is referred to the program on page 266, and the Convention and Exhibition Calendar on page 272 for more complete details of the Convention.

Each delegate to the Convention will be provided with a business and entertainment program, Convention badge and a guide to the Exhibition upon registration. The registration booth will be at the entrance of the Atlantic City Auditorium.

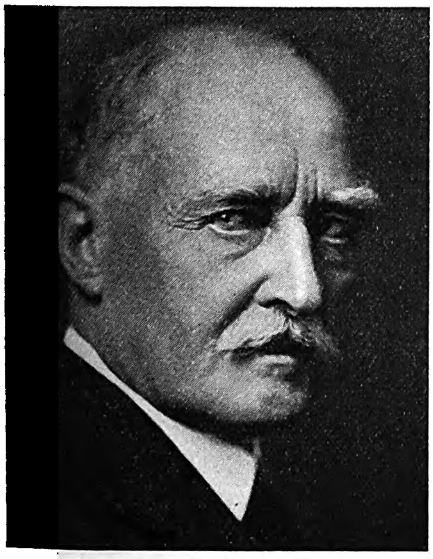
The Exhibition will be the largest and most complete that has ever been held. Opening May 31, three days in advance of the Convention, the Exhibition will provide an unparalleled display of electrical apparatus and appliances.

The entertainment program includes a reception to President and Mrs. Arkwright to be held on Monday evening, June 3. There will be dancing every evening in the magnificent ballroom of the Auditorium. On Wednesday evening special entertainment features will be interspersed with the dancing. The B. A. Rolfe Orchestra will provide the music throughout the Convention, both for dancing and for other occasions. Frieda Hempel, soprano, and Albert Spaulding, violinist, will entertain at the Public Policy Session, Thursday night.

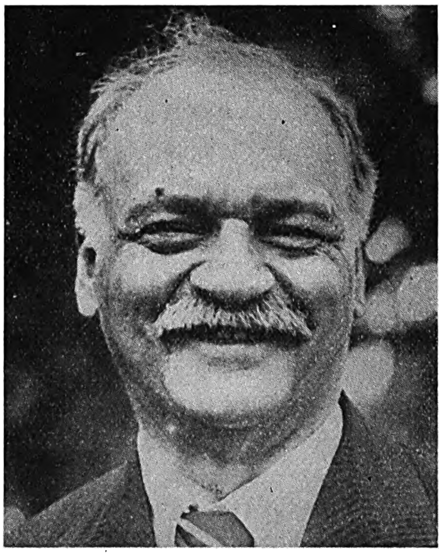
Entertainment for the ladies attending the Convention will include a golf tournament at Seaview Golf Club on Tuesday, June 4, and a card party on Wednesday afternoon, at the Hotel Chelsea.

Vice-President of the United States Curtis, together with Sir Esme Howard, the British Ambassador and dean of the diplomatic corps at Washington, and Don Alejandro Padilla y Bell, the Spanish Ambassador, will take part in the formal dedication and opening of the Atlantic City Auditorium on the evening of May 31. President Arkwright of the Association will have a prominent place in the dedication ceremonies.

The Navy Department, according to Senator Walter E. Edge of New Jersey, has ordered the battleship Wyoming, flagship of the nation's fleet and



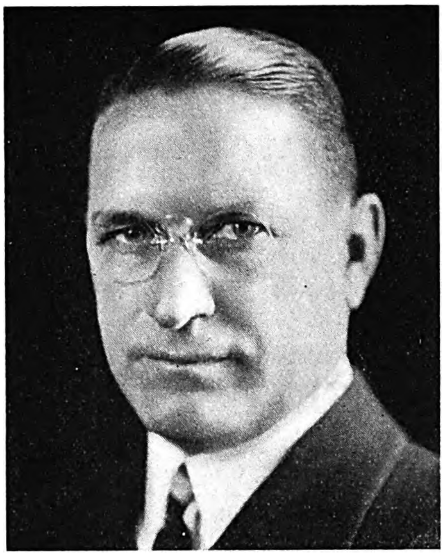
SIR ESME HOWARD
British Ambassador to U. S. A.



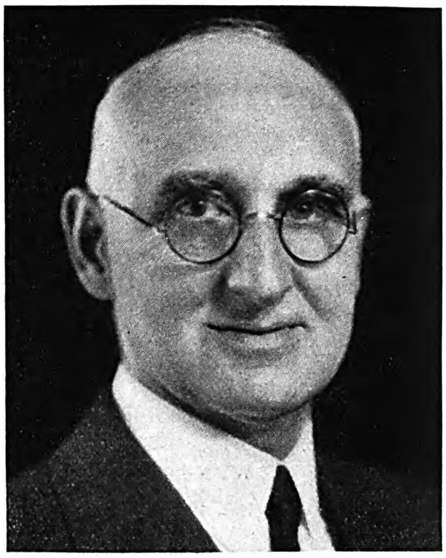
CHARLES F. CURTIS
Vice-President of U. S. A.

DON ALEJANDRO PADILLA Y BELL
Spanish Ambassador to U. S. A.

PAUL S. CLAPP
Managing Director, National Electric Light Association



M. S. SLOAN
Vice-President, National Electric Light Association



P. S. YOUNG
Treasurer, National Electric Light Association

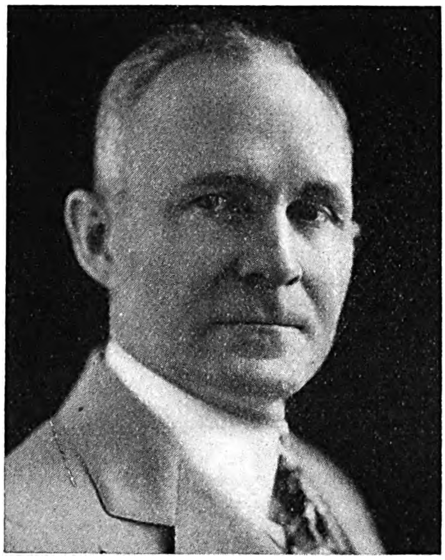
one of the most formidable battle craft afloat, to cruise up and down the coast on the evenings of May 31 and June 1 to engage in a searchlight drill, playing brilliant beams on the dirigible Los Angeles as she floats overhead.

The Vice-President will be accompanied, it was announced, by his sister, Mrs. Gann, while the ambassadors will be escorted by their staffs and by Senator Edge and Congressman Isaac Bacharach, together with twenty U. S. Senators and Congressmen, the entire group coming to Atlantic City in a special car leaving Washington at 12.55 p.m. on May 31.

In addition, the States will be represented by several governors, including Governor Roosevelt of New York and Governor Fisher of Pennsylvania, with Governor Larson of New Jersey as their official host.

Besides the light drill of the Wyoming and Los Angeles, aeroplanes discharging fireworks will speed up and down the coast, adding to the brilliant electrical spectacle presented by the boardwalk and entire city.

The electrical display includes a 75-foot high arch of blazing jewels spanning the boardwalk at States Avenue; an electrical fountain, showers of golden bulbs from the boardwalk standards, lighting of the surf for a mile with all the hues of the rainbow, decoration of Atlantic and Pacific Avenues, the principal municipal buildings, and all boardwalk hotels, together with lighting and decoration of the larger of the side avenue establishments.



J. F. OWENS
Chairman, Public Relations National Section

E. C. STONE
Chairman, Engineering National Section

MARSHALL E. SAMPSELL
Chairman, Commercial National Section

J. F. FORD
Chairman, Accounting National Section

Business Program for 52nd N. E. L. A. Convention, Atlantic City, N. J., June 3-7, 1929

[This Program, at time of publication in the Bulletin, is in tentative state only and will be augmented before the Convention. Slight changes may also be made in time of a few program events.]

GENERAL SESSIONS

M. S. Sloan, *Vice-Chairman*
W. A. Jones, *Vice-Chairman*
P. S. Arkwright, *Chairman*
J. F. Owens, *Vice-Chairman*
Marshall E. Sampsell, *Vice-Chairman*

FIRST GENERAL SESSION

Tuesday, June 4th, 9:45 A. M.

Meeting Room No. 1—Ballroom—Atlantic City Auditorium

9:45 Overture.
10:00 Welcome to Atlantic City.
Honorable Anthony M. Ruffu, Mayor, Atlantic City, N. J.
10:15 President P. S. Arkwright,
Georgia Power Co.,
Atlanta, Ga.
10:40 Treasurer P. S. Young,
Public Service Electric & Gas Co., Newark, N. J.
10:50 Managing Director Paul S. Clapp.
11:05 Regulation.
W. J. Hagenah, Vice-President,
Byllesby Engineering & Management Corp.,
Chicago, Ill.
11:30 (Talkie-Movie).
11:45 Public Relations National Section
J. F. Owens, Chairman,
Oklahoma Gas & Electric Co.,
Oklahoma City, Okla.
12:05 (Title of Address to be Announced).
A. W. Robertson, Chairman of Board,
Westinghouse Electric & Manufacturing Co.,
New York, N. Y.
12:30 Constitution and By-Laws Committee.
R. F. Pack, Chairman,
Northern States Power Co.,
Minneapolis, Minn.
Election — Constitutional Revision Committee.
12:35 Election — Nominating Committee.
12:40 Adjournment.

SECOND GENERAL SESSION

Wednesday, June 5th, 9:45 A. M.

Meeting Room No. 1—Ballroom—Atlantic City Auditorium

9:45 Overture.
10:00 Announce — Memorials Committee.
10:05 The 1929 Exhibition.
E. W. Goldschmidt,
Wagner Electric Corp.,
New York, N. Y.
10:15 Engineering National Section.
E. C. Stone, Chairman,
Duquesne Light Co.,
Pittsburgh, Pa.
10:35 Electrification of Railroads.
Britton I. Budd, President,
Public Service Co. of Northern Illinois,
Chicago, Ill.
10:55 Railroads and Electrification.
George D. Gibbs, Consulting Engineer,
Gibbs & Hill,
New York, N. Y.
11:20 (Movie-Talkie).
11:35 Commercial National Section.
Marshall E. Sampsell, Chairman,
Central Illinois Public Service Co.,
Chicago, Ill.
11:55 (Subject to be Announced).
M. S. Sloan, President,
The New York Edison Co.,
New York, N. Y.
12:15 Science and Progress in the Industries.
J. J. Carty, Vice-President,
American Telephone & Telegraph Co.,
New York, N. Y.
12:35 Adjournment.

THIRD GENERAL SESSION

Thursday, June 6th, 9:45 A. M.

Meeting Room No. 1—Ballroom—Atlantic City Auditorium

9:45 Overture.
10:00 Prize Awards.
W. H. Onken, Jr.,
Electrical World,
New York, N. Y.
10:15 Introduction by President P. S. Arkwright of Mr. John W. Lieb, who will preside for the remainder of the session.
10:35 (Title of Address to be Announced).
Charles L. Edgar, President,
The Edison Electric Illuminating Co., Boston, Mass.
Introduction of
Henry Ford, President,
Ford Motor Car Co.,
Detroit, Mich.
11:10 (Title of Address to be Announced).
Thomas N. McCarter, President, Public Service Electric & Gas Co., Newark, N. J.
Introduction of
Thomas A. Edison.
11:40 Thomas A. Edison.
(Talkie-Movie).
12:00 (Title of Address to be Announced).
Berton Braley, Author,
New York, N. Y.
12:30 Adjournment.

FOURTH GENERAL SESSION

Friday, June 7th, 9:45 A. M.

Meeting Room No. 1—Ballroom—Atlantic City Auditorium

9:45 Overture.
10:00 Memorials.
W. H. Onken, Jr.,
Electrical World,
New York, N. Y.
10:10 Accounting National Section.
J. F. Ford, Chairman,
The Philadelphia Electric Co.,
Philadelphia, Pa.
10:30 Rural Electrification.
J. R. Howard, Past-President,
American Farm Bureau Federation,
Clemens, Iowa.
10:55 (Talkie-Movie).
11:10 Industrial Development in the United States.
J. L. Madden, Vice-President,
Metropolitan Life Insurance Co.
New York, N. Y.
11:35 The Public Right as to Electric Rates.
W. L. Ransom,
Whitman, Ransom, Coulson & Goetz,
New York, N. Y.
12:00 Bernard F. Weadock.
Special Counsel before Federal Trade Commission, New York, N. Y.
12:25 Report—Constitutional Revision Committee.
12:30 Vote—Constitutional Amendments Proposed.
12:35 Report — Nominating Committee.
12:45 Election—Officers and Members Executive Committee.
1:00 Adjournment.

PUBLIC POLICY COMMITTEE SESSION

R. H. Ballard, *Chairman*
W. W. Freeman *Vice-Chairman*

Thursday, June 6th, 8:30 P. M.
Meeting Room No. 1—Ballroom—
Atlantic City Auditorium

8:30 B. A. Rolfe and Orchestra.

8:55 Meeting Called to Order.
W. W. Freeman, Vice-Chairman.

9:00 Charles A. Coffin Prize Committee,
P. S. Arkwright, Chairman,
Georgia Power Co.,
Atlanta, Ga.
Presentation — Charles A. Coffin Award.

9:25 B. A. Rolfe and Orchestra.

9:30 Public Policy Committee.
W. W. Freeman, Vice-Chairman,
Columbia Gas & Electric Corp.,
New York, N. Y.

10:00 B. A. Rolfe and Orchestra.

10:10 Frieda Hempel, Soprano.

10:20 Albert Spalding, Violinist.

10:30 B. A. Rolfe and Orchestra.
(Broadcasting starts—WEAF Red Network.)

10:35 America's Fifty Years of Aladdin.
Julius H. Barnes, President,
Barnes-Ames Co.,
New York, N. Y.

10:55 B. A. Rolfe and Orchestra.

11:00 Frieda Hempel, Soprano.

11:10 B. A. Rolfe and Orchestra.

11:15 Albert Spalding, Violinist.

11:25 B. A. Rolfe and Orchestra.

11:30 Adjournment.

(Note: At the conclusion of this session the audience will please retire to the loggia and corridors, so that chairs may be removed for dancing. Music by B. A. Rolfe and Orchestra. This session will be broadcast through the courtesy of the National Broadcasting Company. A list of participating stations will appear in the convention daily.)

ACCOUNTING SECTION SESSION

J. F. Ford, *Chairman.*
W. R. Emerson, *Vice-Chairman.*
Franklyn Heydacke, *Vice-Chairman.*
J. H. Lobban, *Vice-Chairman*

Tuesday, June 4th, 3:00 P. M.
Meeting Room No. 2—Westminister Hall—
Chelsea Hotel, Boardwalk at Morris Avenue

3:00 J. F. Ford, Chairman,
Accounting National Section,
The Philadelphia Electric Co.,
Philadelphia, Pa.
Announce—Nominating Committee.

3:50 Subject and Speaker to be Announced.

4:20 Subject and Speaker to be Announced.

4:50 Subject and Speaker to be Announced.

4:50 Report—Nominating Committee.

5:00 Adjournment.

COMMERCIAL SECTION SESSION

Marshall E. Sampsell, *Chairman.*
Frank D. Pembleton, *Vice-Chairman.*
T. O. Kennedy, *Vice-Chairman.*
V. M. F. Tallman, *Vice-Chairman*

Wednesday, June 5th, 2:45 P. M.
Meeting Room No. 1—Ballroom—
Atlantic City Auditorium

2:45 Overture.

3:00 Marshall E. Sampsell, Chairman,
Commercial National Section,
Central Illinois Public Service Co., Chicago, Ill.
Announce—Nominating Committee.

3:10 Lighting Bureau.
T. O. Kennedy, Chairman,
The Ohio Public Service Co.,
Cleveland, Ohio.

3:25 Power Bureau.
V. M. F. Tallman, Chairman,
Charles H. Tenney & Co.,
Boston, Mass.

3:40 Merchandising Bureau, Frank D. Pembleton, Chairman,
Public Service Electric & Gas Co., Newark, N. J.

3:55 Speakers and Subjects to be Announced.

4:30 Industry Sales Conference.

4:50 Award of Prizes — K. W. H. Contest.

5:05 Award of Federal Prize.

5:15 Report—Nominating Committee.

5:20 Adjournment.

ENGINEERING SECTION SESSION

E. C. Stone, *Chairman.*
A. D. Bailey, *Vice-Chairman*
Thomas Sproule, *Vice-Chairman.*
Nicholas Stahl, *Vice-Chairman*

Tuesday, June 4th, 2:45 P. M.
Meeting Room No. 1—Ballroom—
Atlantic City Auditorium

2:45 Overture.

3:00 E. C. Stone, Chairman,
Engineering National Section,
Duquesne Light Co., Pittsburgh, Pa.

3:15 Announce—Nominating Committee.

3:20 Shall We Grow Like Topsy or According to Plan?
A. C. Marshall, Vice-President,
The Detroit Edison Co., Detroit, Mich.

3:50 Engineers and Engineers.
F. R. Phillips, Vice-President,
Duquesne Light Co., Pittsburgh, Pa.

4:20 Development of Electrical Standards.
L. L. Elden, The Edison Electric Illuminating Co., Boston.

4:50 Report—Nominating Committee.

5:00 Adjournment.

PUBLIC RELATIONS SECTION SESSION

J. F. Owens, *Chairman.*
E. A. Barrows, *Vice-Chuirman.*
Leavitt L. Edgar, *Vice-Chairman.*
D. C. Green, *Vice-Chairman.*

Thursday, June 6th, 2:45 P. M.
Meeting Room No. 1—Ballroom—
Atlantic City Auditorium

2:45 Overture.

3:00 J. F. Owens, Chairman.
Public Relations National Section, Oklahoma Gas & Electric Co., Oklahoma City, Okla.
Announce—Nominating Committee.

3:15 Awards — Forbes Magazine Public Relations Contest.
B. C. Forbes,
Forbes Magazine and Hearst Publications,
New York, N. Y.

3:25 Speaker and Subject to be Announced.

3:55 Movie - Talkie — "Romance of Power"—C. M. Ripley.

4:25 Subject and Speaker to be Announced.

4:55 Report—Nominating Committee. tee.

5:00 Adjournment.

WHY THEY WENT IN 1890

From an invitation circular to the 12th Convention of the N. E. L. A. held at Cape May, N. J., August 19-21, 1890

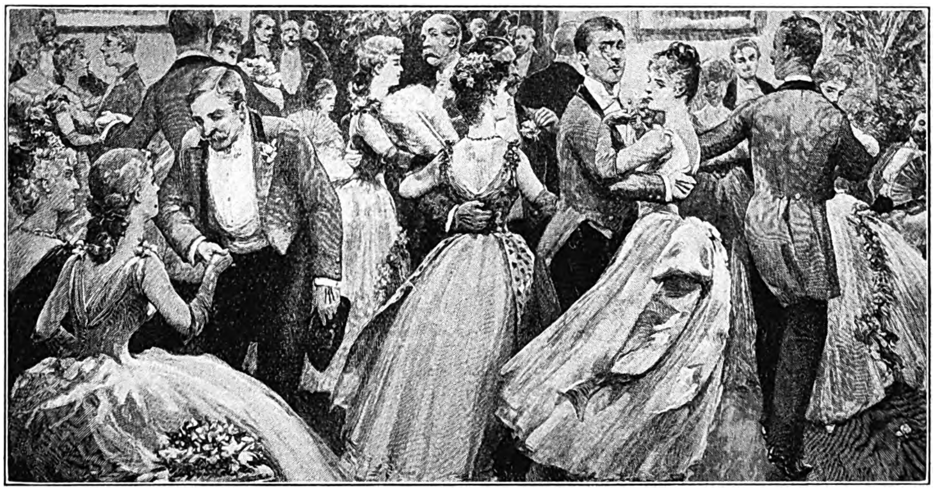
IF YOU have any interest in a central station company, either as a stockholder, manager, superintendent or officer, you should attend the Convention, and there meet those from all parts of the United States who are similarly interested. Through comparing experiences, taking part in the discussions of questions before the Convention, and doing your share to make the meeting profitable to others, it will be sure to be profitable to you.

If you are in a condition to be benefited by an entire change of environment, atmosphere, and occupation, you can secure such a change by going to Cape May.

If you enjoy sea bathing, you will find the finest in the world there. If you have never tried bathing in the sea, you should go to Cape May and gain a new experience.

If you enjoy driving on beach or inland, you can have such drives there.

If you enjoy yachting, you can have fine sailing there. If you enjoy the supplies of a good table well served, you will find them at the Stockton Hotel. If your physical condition is such that you cannot enjoy these things, the salt sea air, the salt water bathing, the fine spring drinking water, the change and rest, will put you into condition to eat heartily and enjoy what you eat.



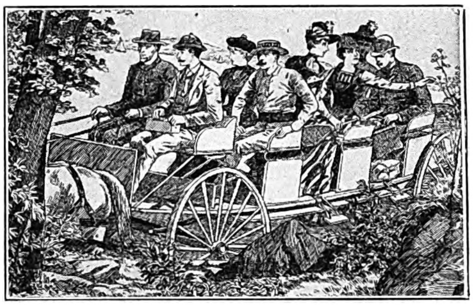
"A hop in the evening"

If you can enjoy a fine orchestral concert during your dinner hour, and a concert or hop in the evening, you will be so entertained at the Stockton Hotel during the electrical season.

If you are interested in the manufacture or sale of any of the long list of supplies used by the central station men, you can meet more of your customers at this Convention in one day than you could in a week of travel. Although there will be no exhibition under the auspices of the Association, you can secure a sample room and display your samples in your own way to the hundreds of users of such supplies who will be at this Convention.

The Way the Time Will Be Spent There

Breakfast from 6 to 10:30.
Morning session of Convention from 10 to 12.
Bathing from 12 to 1.
Dinner from 2 to 4.
Afternoon session of Convention from 4 to 7.
Supper from 7 to 9.
Orchestral concert or hop from 9 to 11.



"If you enjoy driving"

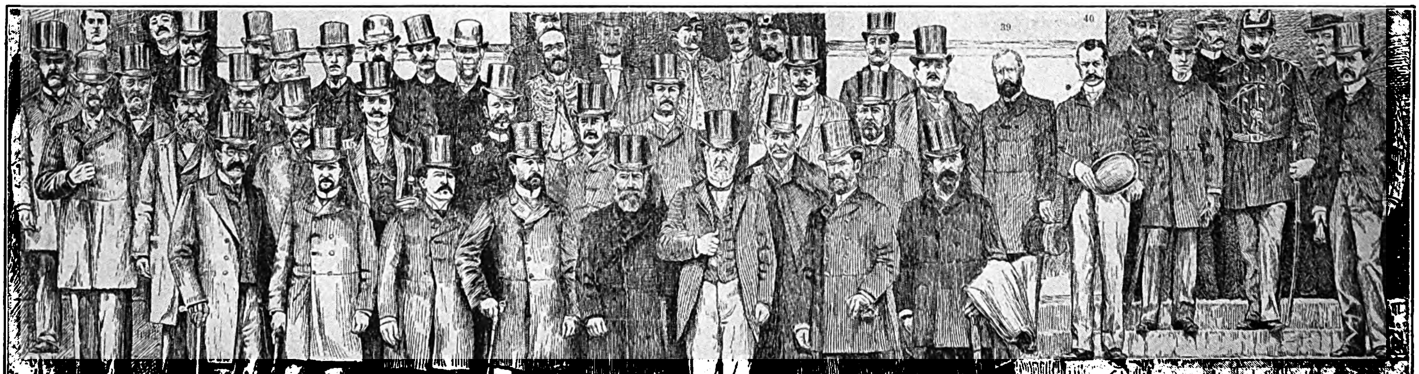
If you are capable of being inspired by meeting the best natured, clearest headed, most progressive men who ever came together in a Convention, you will get enthused by coming in contact with the men who are drawn together by the Convention of the National Electric Light Association at Cape May.

The Convention will meet in the large ballroom of the Stockton Hotel, capable of seating 800.

This room has been placed at the disposal of the Association by the proprietor without charge.

During the dinner hours an orchestral concert will be given in the parlor adjoining the dining room.

For the evening concert or hop, the orchestra and arrangement will be under the management of the Reception Committee. The services of an orchestra of ten pieces, Mr. B. L. Faeder, director, will be furnished by the proprietor of the hotel without expense to the Association.



Amplifier Considers Conventions

By AMPLIFIER

HAVING received, during the past month, what seems like no less than 40 thousand pieces of mail advertising the virtues and magnitude of this or that coming convention and explaining how they will be "bigger and better" than ever before, I have decided to ask myself and, perhaps, some other people: "What's it all about, anyhow?" in the hope that after a few hours of silent meditation, to be followed by a serious consultation with my typewriter, I might find the answer.

"What is a convention and what does it mean to you?" I asked my wife as the most convenient starting point. She sniffed, and when she sniffs, she sniffs. "Just an excuse for a lot of men, old enough to know better, to get away from home and do a lot of things they shouldn't do and wouldn't dare do at home," she replied with quite refreshing frankness. Of course women just don't understand these things. All of which reminds me of an amusing incident which happened to a certain person—name deleted—who attended a big convention about a year ago. At least it was amusing to others if not amusing to him.

THIS particular convention had, like all conventions, its quota of practical jokers. When this "certain person" was packing up to go home one of these practical jokers slipped a lady's handkerchief in the pocket of his bath robe. Since then his wife takes him to work and calls and gets him. If he is late he has to have a written excuse from his boss. The word "convention" has been deleted from the vocabulary of that otherwise happy family.

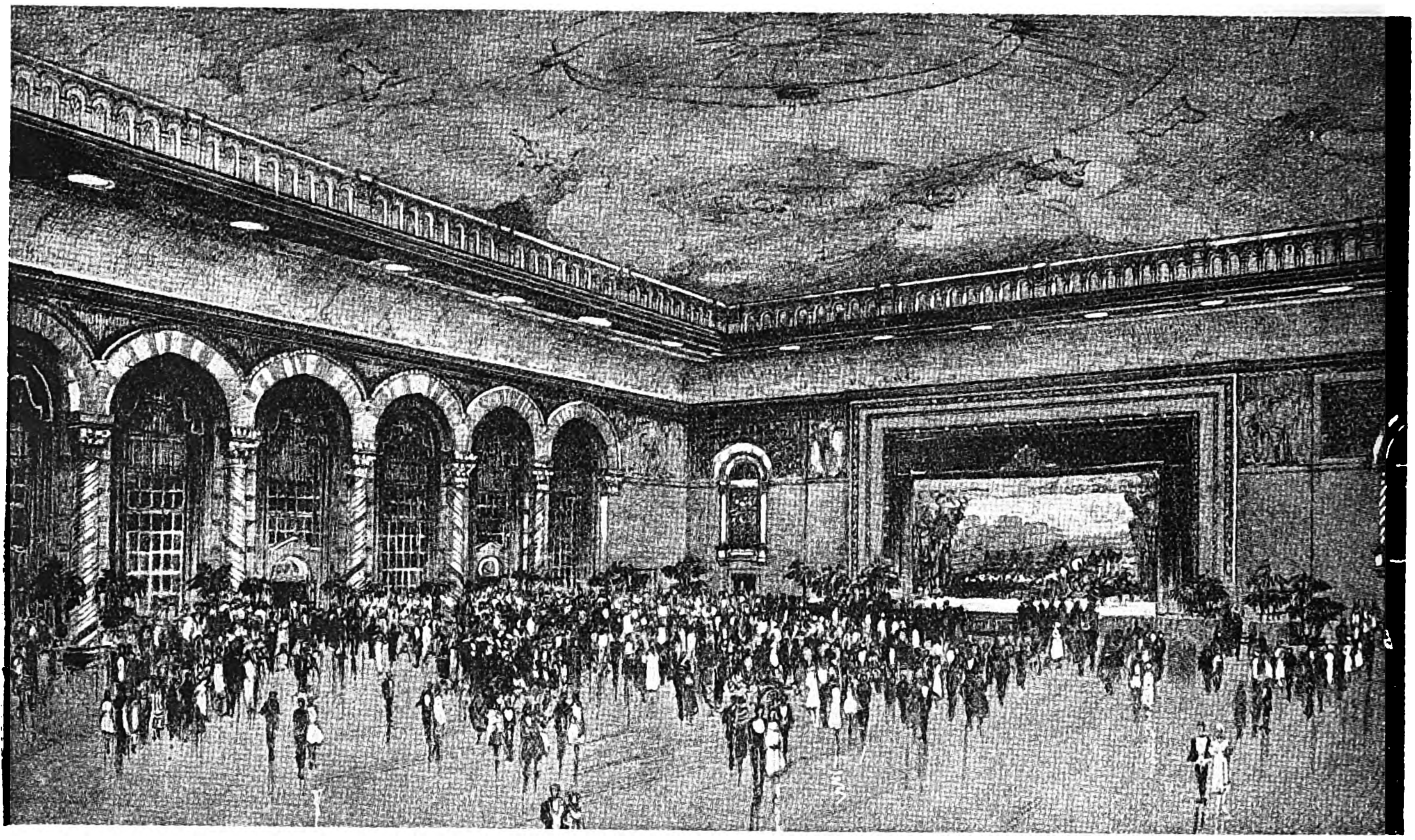
Then there was the young chap who, for some meritorious act or other, won a prize of a trip to a N. E. L. A. convention. It was in Atlantic City and he found lots of things in that well-known town of much greater interest than the sessions of the convention itself. Returning home he gave his wife a running account of all that had happened, and all that he had done, and all the people he had met, and expressed the opinion that his future depended on his attendance at all future conventions. It was good—in fact this young man should have been a writer of fiction.

Unfortunately his wife got hold of a copy of the N. E. L. A. BULLETIN describing the convention and just as unfortunately, she has a good memory. The N. E. L. A. BULLETIN account did not tally with the verbal account given by friend husband. He tried to tell her that the editor of the BULLETIN was all wrong, that he got his information from hearsay, that he was never at the convention, that he wasn't an editor anyhow but just a type setter, and various things like that. No results. If this young man's future depends on his attendance at conventions his career is blasted.

AN exceedingly important executive of a very great company had had a hard day at a convention and his evening was one of considerable relaxation. In the morning, feeling somehow that life was only one great error, he dressed himself carefully and descended to a breakfast he didn't want and thoroughly convinced that he would never want breakfast again. The head waiter followed him into the dining room and touched him respectfully on the elbow. He shook him off and continued ponderously on his way. Again the head waiter approached him with the greatest respect only to be greeted with a snarl: "Well, what do you want?" "Beg your pardon, sir," replied the functionary, "but perhaps you would like to know that you have forgotten your collar and tie, sir."

But to abandon for the time being the lighter side of conventions—Heaven forbid that it should be abandoned for all time—"What are conventions and why?" If we accept a definition for conventions as a meeting of any kind which is held periodically, I think I can qualify to some extent as an expert. I have attended everything from a meeting in Washington, which was little more than a committee of representatives of various interests, to Pan-American conventions in Mexico City and International conventions—they called them conferences because the word convention means something quite different—in Europe. Some of them I have covered as a newspaper man, some of them I have attended as a representative or "delegate," and some of them I have helped to run because I happened to be out of a regular job at the moment. In any event, I feel that I am qualified to contemplate "conventions" with something of the frame of mind of an ancient Greek philosopher.

"WHAT are conventions and why?" Suppose we take for example, one of the most simple conventions in the world—a meeting of the representatives of a number of business enterprises all in the same line of business, called together in the Department of Commerce for the purpose of solving some particular problem peculiar to the industry which is made up of these enterprises. These men represent concerns which, presumably, are competitors. Yet they have a common problem. If it is solved the industry will be benefited, the individual enterprises which make up the industry, will be benefited, and the public, the ultimate consumer of the product of the industry, will be benefited. It is a sample of cooperation between those who are supposed to be fighting one another, which is a great tribute to the genius of President Hoover who, as Secretary of Commerce, called literally hundreds of these meetings having for their purpose the elimination of waste in industry by stimulating industry to solve its own problems



Ballroom of the Atlantic City Auditorium

of waste. It has been estimated that this program has saved American industry more than 500 million dollars a year, which will be reflected, in the long run, in retail prices to the consumer.

Or, let us take what was called the National Conference on Street and Highway Safety, of which Mr. Hoover was chairman. This was nothing more or less than an annual convention of the representatives of all groups—the railroads, the automotive industry, the street railways, the National Safety Council, the automobile owners, the taxicab interests, the Chamber of Commerce of the United States, the insurance people—interested in street and highway accidents. It eventually produced a uniform traffic code which is gradually creeping into all State legislation, and which, it is hoped, will eventually establish uniform traffic laws and regulations throughout the United States, to the great relief of the millions of motorists in this country. Incidentally, through the medium of various committees which have worked throughout the year, it was able to define the problem and produce reports which have been invaluable to traffic authorities ever since.

Suppose we go down to Mexico City and attend a meeting of the Pan-American Federation of Labor presided over by that great old man, Samuel Gompers, now deceased. It was filled with radicals from South and Central American countries. All around the edges were frankly professed communists, I. W. W.'s and bolshevists. It was made up of labor unions of all of North and South America and there was a concerted effort to place the convention on record as being opposed to everything from candy for children to the Government of the United States. Under the skillful guidance of Mr. Gompers and his lieutenants nothing happened. Communism and Bolshevism were washed out and organized labor of the new world was able to stand forth as an opponent to the chaos of sovietism and as an advocate of lawful organization for the good of the many and the confusion of those who would bring about anarchy.

TURNING to Europe let us wander into an assembly of the League of Nations. Regardless of our individual opinions as to whether or not the United States should join hands with the League it is an honest effort to bring about some kind of order after the chaos left by the Great War. Here we find representatives of all of the peoples of the world. If they do nothing else, they have a chance to get acquainted and to interchange ideas. I have had luncheon in the International Club in Geneva and counted representatives of more than 30 countries, all eating—a New England boiled dinner with a fancy French name which the chef had served as a very special delicacy. Even though these people may never reach a definite agreement on anything under the sun, this alone must be helpful in the effort to bring about an understanding among peoples who have never been able to understand one another heretofore. Is it worth while?

Coming back to the United States we are faced with an endless chain of all sorts of conventions. There is the convention of the United States Chamber of Commerce, which presumably represents American business and industry. There are conventions of folks who make clothes, who sell groceries, who manufacture all sorts of things, of welfare organizations, religious orders, pacifists and advocates of adequate national defense, of all sorts of public services, to say nothing of the conventions of luncheon clubs, women's organizations and what not. What are they all about, and do they mean anything to the progress of our social, political, and economic life?

The best way to answer such a question is to examine just one great national convention, and for this purpose, I will take the annual convention of the National Electric Light Association and more particularly, the coming 52nd convention of the National Electric Light Association. What do these conventions produce that justifies the expenditure of the money and time necessary to make them successful?

IT has been said that the real justification of such a convention is that it is the only way to establish a background for the publication of the proceedings. Suppose we play with this idea for a while. If I were going to write a history of the light and power industry—an Herculean task—where could I go to get the necessary material? Nowhere except the proceedings which have been published since the days of the first convention in 1885. It is only there that I can obtain, not only a complete history of the industry, but an adequate picture of the contemporary thought of public utility leaders of the various years. It is the speeches, the committee reports and the final conclusions reached by these conventions that produce the only authentic history of an industry which touches the lives of more people than any other industry in the world; and without these conventions and their records this history would have been lost forever.

Turning back to the record of the convention of 1885, it is interesting to see what the leaders of the industry, then barely three years old, were thinking about. It is also interesting to note among the names of these early pioneers many of those who are the leaders of the industry today. We find the late Mr. Carter Harrison, then Mayor of Chicago, saying, in his address of welcome: "As the father of over 600,000 people, all looking to me for protection, I say we want electricity, but we do not want death dashing like a horrid monster through our streets." Later on in his speech, however, he "hedged" a little and said: "What a startling thing it will be when bottled electricity will put a street car on the rails and send it whirling from the heart of Chicago to the outskirts." What would Mr. Harrison think of his remarks if he could come back and see, for example, the Illinois Central trains gliding along the Lake Michigan shore with apparently no more power than a tiny contact with a third rail?

In this same convention we find the greatest skepticism with regard to the use of electricity as power. A gentleman named Johnson was on the program with a paper on electricity and the electric motor. The presiding officer "begged the indulgence of the conference" saying "it would do no harm to listen to what Mr. Johnson had to say." But Mr. Johnson was militant and had many "wild predictions" to make. He claimed that electric street cars were a certainty, electric railroads a probability and discussed electric power for balloons, submarines and torpedoes. In fact, he was the Jules Verne of this convention.

In the light of present day discussion of the relative merits of water power and steam power, it is interesting to find that this discussion started in 1885. Someone suggested the appointment of a committee to investigate the matter, but it was voted down. It seems that even at this time, 44 years ago, the public already was complaining that the lighting companies were making too much money, in spite of the fact that the companies themselves didn't know whether they were making money or not.

AND so it goes, year after year, if one takes the trouble to browse through these proceedings of each succeeding annual convention. The entire history of the light and power industry unfolds itself—an invaluable chapter in the history of the economic, social and industrial development of the United States which would have been lost forever without the convention.

"Why cannot such a history be written from year to year without the necessity of bringing together people from all over the country for a four or five day meeting with speeches, exhibits, reports and what not?" someone asks. The only answer is that it never has been possible and probably never will be possible. The leaders in any great industry are busy men; they are loath to take the time to do anything not actually pertinent to immediate affairs of the moment unless there seems to be a pressing reason why they should do so. This reason is furnished by a great annual get-together meeting to discuss common problems and the possible future of their industry. It is the only way such industrial history has been written efficiently, and probably will be the only way it can be written in all time to come.

But contributions to history are not the only reasons for conventions. Suppose we look over the plans for the 52nd annual convention of the National Electric Light Association. Let us turn to the question of exhibits. We find that there will be over two hundred of them, ranging all the way from flat irons to giant steam turbines, from incubators to power house equipment, from batteries to hydroelectric equipment and so on down the line, covering every phase of the industry, including generation, distribution, and utilization of every kind, whether in the home, the store, the factory, or at such places as the aviation field or the public streets.

The educational value of such a display of the machinery of a great industry cannot be described in words. Thousands of people will visit these exhibits and return home with a clearer understanding of the intricate problems involved in making and furnishing electricity and have a better understanding of the real meaning of public service. People in the industry itself, many of whom have always been engaged in just one department of it, will learn about the many other departments and appreciate what a truly great enterprise they are connected with.

Again, it might be asked, "Why can't such an exhibit be organized without the necessity of a convention?" Again the answer is that it requires some special occasion to stimulate 200 or more manufacturers to go to the expense of taking part in such an affair. In this instance it is the occasion of the getting together of ten thousand or more of men and women engaged in public service all over the United States. This is the primary reason for the exhibits, and that portion of the public which will be fortunate enough to see them will reap the benefit.

BUT there is a deeper and even more important reason for this great "get-together" than the writing of history or the display of exhibits. This is the opportunity—or excuse, if you will—to renew friendships and acquaintanceships among men all engaged in the same kind of effort, and the opportunity to discuss their mutual interests. There is nothing of the psychology of Mr. Babbitt or the atmosphere of Main Street in this. It is an imperative necessity. The light and power industry is, after all, a great national unit in so far as its obligations to the public is concerned. Just as the day of the small isolated generating plant is passing, so has the time passed when the leaders of the industry can act independently of one another. Each must know something of what the other is doing if the industry is to continue to progress and if its service to the public, which touches the lives of almost every man, woman and child in the country, is to continue to improve. Had it not been for these meetings in the past, with speeches by men of national and international note, committee reports, round table discussions and the many sectional meetings, the industry would not be where it is today. At least it seems so to me and, as I said before, I have attended almost every variety of affairs of this sort and in a good many different languages.

No, conventions have a serious and important purpose and, if there happens to be a lighter side, who is there that will say this lighter side does not also serve. For many who will attend it will be the only relief of a year from the work of serving their own respective communities. A little play will make that work seem a little less like drudgery and perhaps stimulate to even greater effort in the public service.

What of the future of conventions? Will there ever be a great National Association of Associations covering the whole field of business, industry and economics? Why not? Such an organization could serve many useful purposes. For example, there might be a committee to determine what the perfect delegate should wear for breakfast, the sort of bedroom slippers and pajamas that are *ne plus ultra,* and how much ginger ale he should put in his boss's glass, in case said boss uses ginger ale.

Sounds silly doesn't it, but, again, why not? As it is, at the present time the man from Iowa looks at the man from California or Florida and wonders which is correct—the plus fours with the walking stick or the morning suit with a tennis racket. It is all a jumble. Scientific work by committees of such an Association of Associations would solve many problems and above all—tell delegates to conventions just what to do and when to do it and, what is more important, what not to do and when not to do it.

ONE reason why they call this a great country is because a fellow can sleep in a box car tonight, write a popular song tomorrow and be riding in a limousine the next day.—*Two Bells.*

CONVENTION AND EXHIBITION CALENDAR

Friday, May 31st:

Dedication and laying of the corner stone of the new Atlantic City Auditorium in the early afternoon.

Exhibition will be opened at 7:30 P.M. to the general public, remaining open until 11:00 P.M.

Diamond Jubilee of the municipality of Atlantic City and Light's Golden Jubilee will be inaugurated.

Vice President Charles Curtis, Sir Esme Howard, British Ambassador, and Don Alejandro Padilla y Bell, Spanish Ambassador, with other distinguished guests, including Preston S. Arkwright, President of the National Electric Light Association, will participate.

The initial inauguration ceremonies will be conducted from the plaza in front of the Municipal Auditorium and will be concluded from the stage of the Main Hall of the Atlantic City Auditorium.

Saturday, June 1st:

Registration will open at 10:00 A.M.

Exhibition will be opened to the general public at 10:00 A.M. and remain open until 6:00 P.M.

The Grand Inaugural Ball, as part of the dedication ceremonies of the Municipal Auditorium, will be held in the Main Ballroom of the Atlantic City Auditorium at 8:30 P.M. Admittance to the Atlantic City Auditorium on the evening of Saturday will be only by tickets which are to be sold.

Sunday, June 2nd:

Registration will open at 2:30 P.M.

Exhibition will be opened to the general public at 2:30 P.M. and will remain open until about 10:00 P.M.

During the afternoon there will be band concerts in the Main Hall in which the exhibition is housed, and from four to five o'clock members of church choirs and choral societies, numbering several hundred, will give a song festival from the stage.

Monday, June 3rd:

Registration will open at 8:30 A.M.

Exhibition will open at 9:00 A.M. to delegates and guests only.

The President's Reception at 9:00 P.M. to be followed by dancing.

Tuesday, June 4th:

Registration will open at 9:00 A.M.

Exhibition will open at 9:00 A.M. to delegates and guests only.

First General Session at 10:00 A.M.

Accounting National Section Session at 3:00 P.M.—Chelsea Hotel.

Engineering National Section Session at 3 P.M.

Seaview Day Entertainment for the ladies.

Dancing in the evening.

Wednesday, June 5th:

Registration will open at 9:00 A.M.

Exhibition will open at 9:00 A.M. to delegates and guests only.

Second General Session at 10:00 A.M.

Commercial National Section Session at 3:00 P.M.

Card Game for ladies in afternoon.

Entertainment and Dancing in evening.

Thursday, June 6th:

Registration will open at 9:00 A.M.

Exhibition will open at 9:00 A.M. to delegates and guests only.

Third General Session at 10:00 A.M.

Public Relations National Section Session at 3:00 P.M.

Public Policy Committee Session at 9:00 P.M. Dancing at conclusion of this Session.

Friday, June 7th:

Registration will open at 9:00 A.M.

Exhibition will open at 9:00 A.M. to delegates and guests only, remaining open until 1:00 P.M.

Fourth General Session at 10:00 A.M.

Convention adjournment about 1:30 P.M.

This Is Atlantic City

Some Facts That Should Interest You if You Plan to Attend the Convention

By Clifton H. Howell

General Manager, The Atlantic City Electric Company

DURING the past six months my mail has been literally flooded with a great variety of questions about the 52nd convention of the National Electric Light Association, Light's Golden Jubilee, the dedication of Atlantic City's new auditorium, the Festival of Light, and last, but by no means least, the Diamond Jubilee which will mark the 75th birthday of Atlantic City as a municipality.

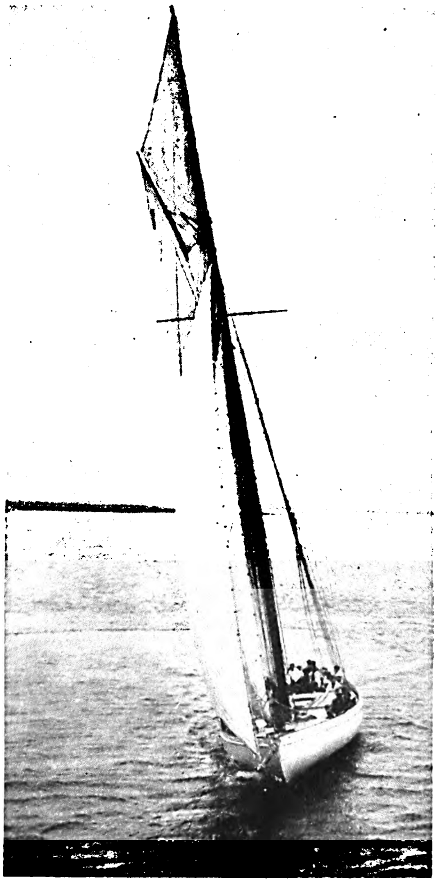
Most of these questions can be answered in a routine manner. If, for example, I am asked anything about the dimensions of the main convention hall in the auditorium I say that if Babe Ruth stood on the stage and drove the longest home run he has ever driven the ball would fall far short of the other end of the room. Or, I explain that Atlantic City has a normal population of about 65,000 people and that every adult in the town could be seated in this room leaving plenty of space for most of the children. As a matter of fact, it will seat comfortably 41,000 people.

If I am asked for information about facilities for dances I say that 3000 people can dance in the ball room adjacent to the main hall and it will be no more crowded than an average Saturday afternoon dancing class. As to parking space for automobiles, it is underneath the building and will accommodate 2000 cars; automotive transportation for 10,000 people.

It's a Big Building

Broadcasting? Certainly—two big broadcasting studios. Hockey? A great rectangle in the main hall can be flooded and frozen in three and one half hours. Music? The pipe organ will be the biggest which any manufacturer has ever attempted and will cost somewhere between $250,000 and $350,000. Chairs for tired folks? We have bought $340,000 worth of them. The chairs which will be used for conventions and meetings are comfortable armchairs, upholstered, and with backs and seats covered with art fabricoid. In fact, this Gargantuan building, costing more than $12,000,000, can respond to any call made upon it by guests of the city, whether it be for facilities for a convention attended by tens of thousands or for a room for a meeting of a few hundred—there are several of these smaller rooms.

In the same way, questions regarding the National Electric Light Association Convention can be easily answered. President Arkwright has said that "this is not just another convention. It has never been held before and probably will never be held again." This is undoubtedly true. It marks the 50th anniversary of the birth of the incandescent lamp and the association is making it an occasion for a celebration such as no industry has ever had. It will inaugurate Light's Golden Jubilee, an international celebration in honor of Mr. Edison, which will last from June 1 until Oct. 21, the date of the birth of this new era of light.



The Festival of Light

The Festival of Light? This is Atlantic City's contribution to the inauguration of Light's Golden Jubilee in honor of Mr. Edison and the great light and power industry for which he laid the cornerstone back in 1879. The city itself has already spent more than $60,000 in this direction. The General Electric Company is constructing and will present to the city a magnificent electric fountain, which will have 21 color and water changes and which is now being permanently installed. Floodlights placed beneath the Boardwalk will play on the crests of the waves as they roll in, lighting them up with every color of the spectrum. The Arch of Jewels, designed by Mr. D'Arcy Ryan of the General Electric Company and containing more than 25,000 electric jewels, is on a scale far greater than anything which has ever been attempted either in this country or in Europe.

The hotels and other business interests generally have joined enthusiastically in with the plans for the celebration and are spending large sums on their own account, for effective exterior lighting decorations. Merchants are planning to decorate their show windows and buildings with the very latest effects in electric lighting. Smoke stacks and steam stacks will be lighted in such a way that flame, instead of smoke and steam, will seem to be issuing from them. The present lighting standards along the Boardwalk will be removed and their places taken by 177 great sprays or clusters, each 26 feet high and each containing 145 golden lamps. In fact, visitors to Atlantic City this year will see a display of lighting such as man would not have dreamed of a few years ago.

The dedication of the new auditorium? That is an easy one to answer. It has been postponed in honor of the Convention of the National Electric Light Association which will christen it. It seemed a fitting thing to dedicate this great building, marking as it does, a new mile-stone in the progress of Atlantic City, at the time of the opening of the first great convention which it will house, particularly in view of the two jubilees which will begin at this time.

Two Outstanding Questions

But running through all of the inquiries which I have received is a strain of curiosity much more interesting than mere questions about dimensions, technical details, accommodations and the like, and which, at the same time, is more difficult to satisfy. It is for this reason that I have accepted the invitation of the editor of the N. E. L. A. Bulletin to write an article and even though my literary experience has been largely confined to operating log sheets and periodic financial statements, I have neither the desire nor the time to extend that experience.

There seem to be two outstanding questions which are asked. The first is: "why is Atlantic City going to all this expense and taking so much time and trouble to do honor to one man—Thomas A. Edison—and to the great industry for which, after all, he is so largely responsible?" The second is: "how can a city of 65,000 people build and maintain a $12,000,000 auditorium which cannot possibly hope to earn more than operating expenses, leaving other carrying charges to the local taxpayers?"

To answer these questions properly it is necessary to study briefly the history of Atlantic City, the role which it plays in our national life, its psychology and more particularly the psychology of its people. Unless one understands this great resort as a national institution one cannot possibly see why it should embark on an undertaking of this kind when the city cannot hope to benefit directly in the way of definite financial return.

A generation ago the casual visitor carried away a more or less kaleidoscopic picture of the boardwalk, "hot-dog" stands, salt water taffy, auction rooms of the sort that only led the unwary buyer to disappointment, merry-go-rounds, band music, piers with devices designed to produce laughter, a beautiful beach peopled with tens of thousands of people in rented bathing suits, a forest of frame hotels and a general atmosphere somewhat similar to that found at Coney Island. One went up to the Inlet to go sailing and down to the other end of the Boardwalk to see the Great Elephant Hotel. In between was a long lane of small shops, eating-places, fortune tellers, beach front hotels and what not.

Something Quite Different

The Atlantic City of today is something quite different. It has taken on a new dignity and its citizens realize that while it is not a producing community in the sense of manufacturing all sorts of goods to be shipped to the four corners of the country, it is producing and offering to the people of the United States something which we think is of far greater value and which cannot be measured in dollars and cents. I say of "far greater value" because almost any community with good transportation facilities, proper housing conditions and within reach of adequate markets, can produce material things. But nowhere in the world can one find, in a single resort, such a great diversity of things intended to bring rest from the drudgery of everyday life and relief from the monotony of the tasks which go to make up what is called "earning a living."

It is because of this fact that in the 14,000,000 people who visit Atlantic City every year one will find the greatest cross section of the American public that it would be possible to find anywhere. These people, themselves, provide a study in humanity which should be the joy of any sociologist. The reason is that in Atlantic City the man of modest income, giving his family the annual two weeks' vacation, can have just as good a time and see exactly the same things as the man whose income tax alone would support several families in comfort and who has a hundred dollar a day suite in a beach front hotel.

To Fit All Purses and All People

Atlantic City is a city of 65,000 population with accommodations for 500,000 people. It is perhaps the only resort in the world which offers the opportunity for a vacation which will cost no more than the sum set aside for that purpose or the opportunity for a vacation which will cost any sum the individual may have to spend. One can secure a room with three good meals a day for a fixed sum per week in a modest hotel one or two blocks from the boardwalk or can secure accommodations in some palatial beach front hostelry and pay, if he so desires, any sum he pleases. Or, he can go to one of these same beach front hotels and know exactly what his bill is going to be at the end of his visit. He can secure rooms in a cottage or he can rent a cottage which may cost him $10,000 for the season. Atlantic City has something to fit every pocket-book, and its guests during the season are drawn from almost every walk of life.

Among them one finds book-keepers and capitalists; law clerks and supreme court judges; cub reporters and authors of best sellers; social leaders and men and women who do not own, and never expect to own, evening clothes; government stenographers and cabinet officers; college graduates, erudite professors and presidents of great universities; folks tired from a year of great effort and folks tired of having nothing to do; people of every possible social or financial status; Atlantic City has something for each and every one. It is because of this that it is unique among resorts and it is because of the realization of this that it and its people have acquired a new dignity. It is rendering a service which can be rendered nowhere else. It has been rightly called: "The Playground of the World."

A Neat Show Window

And so we come to our first question: "Why is Atlantic City, which is full to overflowing all during the season, spending so much money, time and effort to do honor to Mr. Edison and the electric light and power industry?" Let us see.

Essentially, it is, among other things, a great show window. More than 14,000,000 people pass this show window every year and it costs no more to look than it costs to look at the shop window of any department store. It is for this reason that such an institution as the General Motors Corporation has gathered together, for the first time in its history, all of its products under one roof. Nothing is sold and it costs nothing to look at them. Literally hundreds of other great enterprises have done exactly the same thing until the city is literally a university of American business and industry. The exhibition of the light and power industry which will be housed in the auditorium will, of itself, be an education in this great force which at some time or other touches the life of every man, woman and child in the United States.

One of the things which has made this great show window possible is electricity. Without it Atlantic City would be the Atlantic City of two generations ago. It is not only the "window dressing," but it has made possible almost everything which the community has to offer those in search of diversion and forgetfulness, for the time being, of the drab tasks of everyday life. The city and its people know this, and what is more fitting than this spontaneous expression of appreciation on the occasion of the 50th birthday of electric light and the industry built on the genius of one man—Thomas A. Edison?

We would indeed be ungrateful if we did not seize this opportunity to do first honor to him—a citizen of our great State of New Jersey—who has labored here in this State for the last half century. It is altogether fitting that we should dress up our Atlantic City— this international show window—with this great exhibition of lighting and to thereby evaluate the electric light on a new and vastly higher plane.

Satisfying Pride

There is nothing commercial about this celebration which is costing the taxpayers generally, as well as hotel owners, merchants and other individuals, so much. It has nothing to sell. It will add but little to the material prosperity of the community. But it will satisfy that streak of pride which runs through the character of all self-respecting peoples—a desire to put on "our best front" and to acknowledge our debts whether financial, moral or social.

The answer to the second question: "How can a city of 65,000 people build and support a $12,000,000 auditorium and why should it attempt to do so?" can be found, to some extent, in the answer to the first. This colossal enterprise is the dream of one man—former Mayor Edward L. Bader—and to him should go full credit for its final consummation. One of the most distressing things to the citizens of Atlantic City is that he could not live to see it. When he first projected the idea he met with nothing but ridicule and opposition. Single handed he fought for it at first. He realized, better than almost anyone else, Atlantic City's future destiny and knew that it must be prepared. Starting as a $7,000,000 project it grew to an expenditure of $12,000,000 and the end is not in sight. Today we are the proud possessors of the greatest auditorium and convention hall in the world. Only recently an official of the city of Chicago, in response to a letter, said: "We have a pier 2250 feet long. We'll send that down to you and you can stick it off in a corner somewhere."

But why? What is the answer?

In the first place Atlantic City is becoming the most popular convention city in the United States. Business leaders from all over the country visit us during the course of the season, look at our show window, and go away convinced that it is an ideal spot for the annual convention of any industry. It has none of the disadvantages of the large metropolitan city in that it is comparatively small and compact, making it possible to hold the delegates more or less together; a difficult task, as anyone who has managed a convention knows. It has a vast amount of diversion for these same delegates when they are "off duty" thereby eliminating any possibility of a "tiresome" atmosphere. And again, for the sake of emphasis, it is the world's greatest show window.

The Obligation to Our Customers

These people are the customers for our only product—the facilities of a great playground. We owe them the same obligations as those of any manufacturer or business man to his customers. Our ability to house the great conventions which have sought our hospitality in ever increasing numbers has constantly been challenged and each year we see new and bigger facilities being added to our present $100,000,000 investment in these magnificent beach front hotels. A convention which is attended by a thousand or fifteen hundred people normally will be attended by five or six thousand when it is held in Atlantic City. This is not boastfulness; it is fact which can easily be proved by the records.

But what to do? The answer has been found in Mayor Bader's dream. He realized that Atlantic City must either progress and add to its facilities or go back. He said that it would either reach, in the near future, its rapidly approaching peak and then sink quietly back into the oblivion of a second-rate summer resort, or it must respond to the demands of its customers regardless of the cost. And in spite of ill-health and many worries he "sold" the idea and sold it so well that we, of Atlantic City, were fired with all of his enthusiasm and today think of him in terms of the most profound gratitude.

And so we have the answer to our two questions as well as I can give them. It may sound idealistic or altruistic or anything else which the student of community psychology may choose to call it. For myself, as the operator of a light and power company, I can only say I am intensely grateful to my community for the manner in which it proposes to do honor to my industry and its Grand Old Man, Thomas A. Edison, and grateful for the great vision which will make it possible for us to entertain such an organization as the National Electric Light Association in a fitting manner on the occasion of Light's Golden Jubilee.

A Group of Atlantic City Hotels

President Hoover to Head Light's Golden Jubilee Committee

President Hoover will head the General Committee sponsoring Light's Golden Jubilee, the world-wide tribute to Thomas A. Edison and celebration of the fiftieth anniversary of the inventor's perfection of the incandescent lamp.

In accepting the honorary chairmanship, President Hoover wrote: "I shall be delighted to act in any capacity that will mean a genuine tribute to Mr. Edison's services."

Other members of the committee announced to date are: General Robert L. Bullard, John W. Davis, Harvey Firestone, Henry Ford, James W. Gerard, Clarence H. Mackey, Andrew W. Mellon, John D. Rockefeller, Jr., and Charles W. Schwab.

During the N. E. L. A. convention at Atlantic City, one day will be set aside as Edison Day. On this day detailed announcement of Light's Golden Jubilee will be made and the official Plan Book will be distributed.

Throughout the summer and early autumn there will be made events to keep Light's Golden Jubilee at the forefront of public attention, all leading up to the official celebration on Oct. 21, the fiftieth birthday of the lighting of the first practical incandescent lamp. A speaker's bureau has been organized and will provide a corps of speakers who will carry the story of Light's Golden Jubilee to over ten thousand Chambers of Commerce, civic organizations such as advertising clubs, Rotary, Kiwanis, Boy Scout organizations, Girls' Campfire organizations, and others; women's clubs, lodges, trade groups, and other similar types of organizations.

Governments and other institutions throughout the world will also find opportunity to honor the founder of the epoch of light. A trained group of writers, guided by leaders of international reputation, will provide the press, magazines, and trade journals of the country with appropriate accounts of each event as it occurs and will furnish authentic articles on the part that lighting plays in making progress. News reels and talking movies will help to impress the public mind with the magnitude of Light's Golden Jubilee.

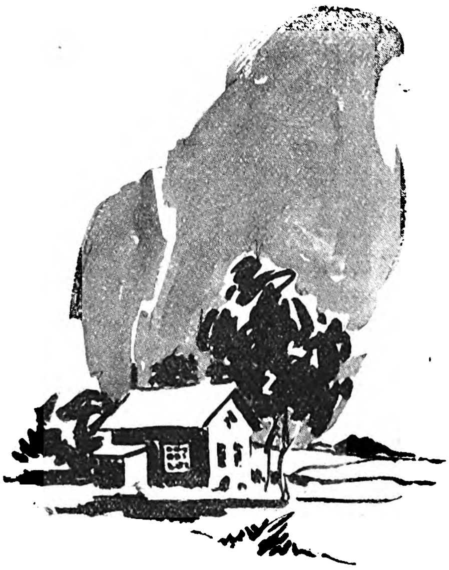
Following the opening of the celebration of Light's Golden Jubilee in Atlantic City, May 31st, coincident with the celebration of Atlantic City's Diamond Jubilee and Festival of Lights and the opening of the N. E. L. A. Convention, the next major event in the celebration Light's Golden Jubilee will be the Fifth Annual International Festival of Lights at Niagara Falls on June 13, 14 and 15. There will be the dedication of the new Municipal Airport, a giant illuminated parade, special fireworks, the annual convention of the Loyal Order of Moose, with its own parade, and a reproduction of the first electric lighting generated by falling water at Niagara Falls fifty years ago.

The Niagara Falls celebration is being arranged under the auspices of the municipal governments on both sides of the river, in cooperation with civic organizations, industries, citizens and the great hydro-electric plants on both sides of the river.

Then, on Oct. 19, two days before the actual celebration, *The Saturday Evening Post* is expected to carry the tribute of the lighting industry to its founder. This tribute will take the form of a special section of more than twenty pages, to be printed in full colors.

Many magazines are expected to carry advertising messages to herald Light's Golden Jubilee. Among these will be the women's magazines because who, better than the women of the world, appreciate this Age of Light?

All over the land replicas of the first lamp built by Edison will be on display. Stores will have their windows decorated in the spirit of the jubilee. Exact reproductions of the New York *Herald* of Dec. 11, 1879, announcing the invention of "Edison's Light," the light which burned "without gas or flame, cheaper than oil," will be distributed to hundreds of thousands of homes through many different channels. What better opportunity to get a bird-eye view of the Age of Light? These plans are but the preliminaries leading up to the official celebration on Oct. 21. A later issue of the Bulletin will give details of what is planned for that date.



Edison's original laboratory at Menlo Park

Edison, founder of the Age of Light, is with us in the flesh. In this actual presence the youth of today catches a profoundly human inspiration — a practical lesson in success from this man who was so little appreciated in his youth, and who later became the founder of this great age. Here we have inspiration, not out of copy books, but out of the daily records of the times.

That is why the fiftieth anniversary of the invention of the practical incandescent lamp should be the greatest golden jubilee the world has ever celebrated!

What civilized man can honestly deny that much of his happiness, comfort, and well-being is due to Edison? What industry can honestly stand aloof and say that it has not been revolutionized by this Age of Light?

What educator will quibble with the assertion that no greater opportunity will ever exist to impress upon the youth of the world, the ultimate triumph of perseverance, fairness, and hard work, than this living tribute to a man who coined the significant phrase, "Genius is one per cent inspiration and ninety-nine per cent perspiration?"

Light's Golden Jubilee will be the greatest tribute that has ever been paid to a man, living or dead, because it bows before a man whose deeds place him definitely among the greatest of the immortals. It takes its bigness, its impressiveness, its constructiveness from the man it honors. The man of miracles. Our "Great National Asset."

Behind the Veil

The Philosopher's Stone

By ERNEST GREENWOOD

The second of a series of articles under the general title of "Behind the Veil" which will portray against a social-historic background, the evolution of the electrical industry and the chief personalities that have been instrumental in its growth

THERE is an old saying, familiar to everyone from the days of earliest childhood, that "necessity is the Mother of invention." But is this true? Is a great invention summoned by necessity, or does it create the era that it serves? It is a question which has been debated since time immemorial, but like most of the broad questions raised by history, no definite, positive answer is possible.

Suppose we take, as an example, the invention of the incandescent lamp. Was it brought into being by Edison because of a crying need for a new and different kind of artificial light, or because of the restless desire, so characteristic of the American people, for something better than that which they have? Did it not create this great era of light which followed and which it has, in turn, served so faithfully?

EIGHTY years ago 700 ships went forth to gather whale oil with which mankind might read or write at night. No better common illuminant was known on Feb. 11, 1847, when Mr. Edison was born. Kerosene succeeded whales and gas succeeded kerosene. Between 1865 and 1875 great progress was made in the art of lighting homes with gas, and as long ago as 1855 Robert Wilhelm von Bunsen had invented the blue flame gas burner which is still in use today. About the time when electric lights threatened to supplant gas, Carl Auer discovered the incandescent gas mantle for which he was awarded the title of "von Welsbach," and the Welsbach mantle is used today wherever gas is burned for street lighting. Some of us of the passing generation still remember, somewhat regretfully, the old kerosene student lamp, with its amber or yellow shades and its comfortable home-like glow.

Again, suppose we take the inventions of Edison, which made the central generating station—the first one of which was placed in operation in 1882—possible. True the generating station was necessary for a proper exploitation of electric lighting, but can it not be said that it was a product of the incandescent lamp, assisting in the creation of the new era it was destined to serve? The same reasoning might be applied to the steam turbine—it was due to a restless searching for improvements in the art of generating electricity by steam rather than to necessity, *per se*. Scientific research sought and soon found a way to build a steam turbine of almost any size and these Gargantuan machines have created a new era in steam generation, which they now serve. They are rapidly removing the serious fear that the nation will have to depend on water power which can never adequately supply the light and power needs of the people.

ROGER BACON

From a photograph of the Statue by H. R. Hope-Pinker, at Oxford University

To thoroughly appreciate the thesis that great inventions create the eras which they serve rather than come into being because of necessity, a brief picture of the eighteen hundred or more years which elapsed between the days of Thales and the advent of Friar Roger Bacon on the stage of scientific history must be presented. Bacon, who was born about 1214, lived in a period still overshadowed with intellectual darkness and when ignorance was at a premium. Yet it was he who first insisted that without experience nothing can be known with certainty. He was, perhaps, the first to advance the science of "experiment" or the method of research sometimes called "trial and error." "Chariots that may be moved without animals at incalculable speed" was one of the prophesies that earned for him a jail sentence. For centuries after his death people were still burned at the stake, or otherwise tortured, for venturing to accept the authority of sound reasoning and of their own experience and observation. And so a glance at the history of the times between the Ionian philosophers who lived 600 years before the birth of Christ and the beginning of the 17th century, (during which time there was little scientific development as we understand science), is required if we are to understand the social and political backgrounds for what has been called, for want of a better name, the machine age.

FROM 490 to 470 B.C. there raged the great war between the Persian Empire, conqueror of all the older empires to the East, and Greece. The Persian armies entered Athens and burned it. But eventually in the narrow bay between Salamis and Athens, Themistocles concentrated the entire Greek fleet and within a few hours the fate of Greece, and perhaps the fate of the whole Western world, was decided. As Geoffrey Parsons in his "Stream of

History" tells us so vividly, "at the first onset, the Persian line was thrown into disorder. Following up their advantage, the Greeks struck right and left, riding over banks of oars, capsizing the enemy triremes, crashing through their sides so that they swiftly sank. The victory became a rout, and by nightfall the broken remnants of the great king's fleet were flying eastward in hopeless disarray. Surrounded by his magnificent court, Xerxes watched the battle at his feet with horror turning to dread. Long before the end, he rose from his throne, rent his robes with a loud cry, and fled the scene. The West was saved."

Within fifty years what many consider the most beautiful buildings ever built arose from the blackened ruins of Old Athens. Within 150 years three great philosophers (whose work remained for 2000 years the basis of every speculation about the universe), lived and died. Science grew slowly, reaching its climax in the mathematicians of Alexandria within a period of about 250 years after the battle of Salamis. This work of accurate study could only make a brilliant beginning; it was in art, poetry and philosophy that the Golden Age of Greece, from 480 to 330 B.C., was supreme.

SOME historians have described this period as "the most brilliant and crowded period of achievement the world has seen." Most certainly our grandfathers thought so. We on the other hand, are inclined to feel, with some justification, that the past 100 years, bringing, as they have, modern transportation, communications, light and power, and all of the thousand and one great inventions which have made such marked changes in the life of civilized man, as the "most brilliant and crowded period of achievement the world has seen." But we must not forget the circumstances surrounding the work and thought of those early Greeks. They had neither background nor traditions of philosophy or science. In modern vernacular they started from "scratch." Considering these things their achievements, which have come down to us through the centuries as the basis of modern thought and achievements, might easily be considered as even more brilliant than those of our own times.

The political structure of ancient Athens was nominally a pure Democracy—crude and clumsy. Every citizen took his turn as a legislator, judge and executive. But only one man in five was a citizen, the other four being slaves or aliens without the right to vote or become citizens. It was, however, a democracy "as direct as a New England Town Meeting" and worked only because the entire voting population could be gathered together for debate. At these gatherings or assemblies, which met four times a month, a council or Senate of 500 was chosen by lot to act as a standing committee In this council the members took turns, fifty at a time, doing the executive business of the city, and from the fifty, one person was chosen by lot, to be at the head of the government for 24 hours. This may seem to us to be a bit strange and worth thinking about when we realize that it was a pure democracy and not a republic such as the government of the United States. We might even wonder if the late President Wilson was thinking of these items when he talked about "the self-determination of small peoples" and "making the world safe for democracy." It is quite possible, however, that this method of choosing legislators and executives by lot brought into public service about the same average of wise and expert representatives as our own method of election. One of the compensating features was that the time of service was brief.

Curiously enough we have, even today, a class of people whom the history of experiments in government, and more particularly in democratic forms of government, seem to teach nothing. Our own republican form of government, which is about as democratic as it could possibly be and still be practical, is so unwieldy that it has great difficulty in conducting the affairs of government on anything like a business basis. Yet these folks would have it take over all sorts of businesses of production and distribution which have, up to the present time, been left to private enterprise.

BUT there was a kind of executive which the Athenians did not choose by lot. That was the strategus, or general. There were ten of these generals and the ten elected a leader. Pericles was chosen chief strategus in 460 B.C., and was reelected year after year. It was during his administration that Athens reached her greatest heights and it is interesting to note that while nominally a democracy, Athens, during her greatest years, turned over the reins of government to one able man.

We can find more than one interesting analogy to this situation in the history of our own times since the great war. Italy, for example, has turned over its government, lock, stock, and barrel, to one man, Mussolini, who, to paraphrase a sentence by Richard Washburn Child, has cleared away "Chaos' own junk pile" in that country. "Mine" says the most unique figure on the European stage—"I take the responsibility for all." Hungary welcomed Admiral Horthy while Spain submits more or less smilingly to the dictation of de Riviera. Perchance there are other countries that might do well to consider the advantages of "one able man" as dictator—at least for the time being.

THE three Peloponnesian wars (459-404 B.C.) ended the power of Athens for all time. It was still the Golden Age insofar as the Greek mind was concerned, but in all matters of government it was an era of blundering. A democracy, in which every decision must be made directly by thousands of citizens assembled in meeting, presents a hopeless problem. During this period the Athenian democracy in its desperation became cruel and vindictive and made hundreds of mistakes. It was this beaten and humiliated Athens which put Socrates to death in 399 B.C., one of the many disgraces that marked the government of Athens by the generations that succeeded Pericles.

Eventually King Philip of Macedonia conquered most of the Greek states and planned to unite all Hellas in one empire. He was succeeded by his son Alexander (356-323 B.C.) who subdued Greece, routed the Persian armies in Asia Minor, freed the Eastern Greeks, conquered Phoenicia and Egypt and eventually brought under his rule all the peoples of the Orient between the Euphrates and the Tigris on the West and the Himalayan Mountains and the Indus River on the East. He has gone down in history as Alexander the Great. But Parsons tells us: "In organizing Hellas into a vast empire, Alexander unwittingly killed her soul. But he was keenly appreciative of the great heritage of Greece, and, even while himself sinking deeper and deeper into oriental luxury, labored to spread the civilization in whose name he conquered. He took Greek scientists with him into Asia, and through them sent back to Athens hundreds of specimens of plants and animals for his old tutor, Aristotle. He founded Greek cities bearing his name even on the frontiers of India. From these centers Greek art spread across Asia, to inspire the art of India, and to influence the artists of China and Japan. Attic Greek became the language of cultivated men throughout the empire. Greatest of all, the emperor founded in Egypt at the mouth of the Nile the city of Alexandria, to become the repository of all learning and to remain for 300 years the intellectual center of the ancient world."

All this happened more than 1500 years before the invention of printing. Consequently the great Alexandrian Library contained no books. It consisted, instead, of more than 500,000 manuscripts written on long rolls of papyrus arranged in about 120 divisions and sub-divisions. One has only to go into a modern public library to realize the difficulties which the student of those days must have encountered in using these manuscripts. The texts of the classics, however, were carefully edited and most of the modern editions of them are founded on the Alexandrian editions. Unfortunately, this library was destroyed by fire during the rioting at the time when Julius Caesar was paying his famous visit to Cleopatra—one of the greatest losses which has ever befallen mankind.

THE leading interest in Alexandria at this time was science. Aristarchus demonstrated to his own satisfaction that the earth and planets moved around the sun, but this thesis was not accepted until the time of Copernicus, some 1500 years later. These Alexandrians had automatic door-openers and sprinklers, endless chains for ammunition-hoists, and even an automatic theater. Running water was piped into houses, with many of the conveniences of modern plumbing; the old folks mourned the "good old times," just as the old folks of today.

Yet nothing came of this most exciting and hopeful era. Under the rule of practical Rome, the intellectual growth of the Western world was stunted and made but little progress until the rise of modern science. Except to a very few, what the wise men of Alexandria knew in the first century before Christ remained completely hidden, for nearly 2000 years. As Mr. Parsons says: "It is the most extraordinary halt in human progress that is known. One cannot pretend to explain it, but one can at least trace the circumstances that surround it."

Rome endured, roughly speaking, for a thousand years—from 500 B.C. to 500 A.D. During the first 500 years it was know as the "Roman republic" but it was a republic in the modern sense only to the extent that the executive heads of the government were elected. The first of these elected heads were two consuls selected by the patricians. In other words the "republic" was in no sense a democracy; it was based on an aristocracy of nobles. The people revolted and finally secured the election of so-called "tribunes of the people." Finally they secured a share in the law-making by means of a huge assembly somewhat similar to the Athenian assembly which became more and more unwieldy as the Roman state grew. Gradually a small compact body known as the "Senate," composed of elderly patricians, forged to the front; eventually even this body was forced to admit to membership "plebians" who had held public office.

The downfall of the Roman republic began when a policy of over-seas conquest was adopted. This period of conquest marched forward from 264 B.C. to 146 B.C., and in that time the entire Mediterranean world and most of the Alexandrian Empire had surrendered to the armies of the Roman Senate. This was followed by 100 years of revolution and counter-revolution with one dictator succeeding another until a strong imperial rule under Augustus, starting in 30 B.C., saved the Roman state from disintegration. During these years of conquest Rome destroyed Carthage, driving a brilliant Semetic civilization out of Europe, humbled the great Hannibal, and sacked and burned the famous Greek city of Corinth. One of the finest libraries in the world was thus destroyed, an act of vandalism far surpassing the deeds of the barbarian vandals who, 600 years later, captured Rome and gave their name to wreckers of civilization.

BUT the Roman republic was doomed. Julius Caesar (102-44 B.C.) returned from the conquest of Gaul which had occupied him for eight years (58-50 B.C.), to find that his old ally, Pompey, had gone over to the Senate and secured election as sole consul, a virtual dictatorship. Caesar crossed the Rubicon, a little stream that marked the boundary of his province, drove Pompey out of Italy, and made himself master of Rome. Pompey eventually fled to Alexandria, where he was assassinated, and Caesar, following him there, fell in with Cleopatra and held up his wars of conquest for eight months while he paid court to her.

Returning to Rome he had himself made Dictator for life. Just five years after he had crossed the Rubicon he was assassinated by his close friend Brutus, at that time leader of a group of fanatical republicans. But the ancient republic, of which these conspirators dreamed, never returned to Rome.

"SCIENCE lay hopelessly dead in Rome," Parsons tells us, "crushed out by the practical genius of her people. The geometry of Euclid was taught, but only to learn the propositions by rote—the reasoning on which they were based was ignored as having neither value nor interest. Mathematics became a useful aid in construction; it ceased to be a science at the very moment Alexandrian scholars were on the brink of brilliant discoveries. The same held true of medicine, astronomy, biology and the other sciences in which Greek genius had so brilliantly lighted the way. The curtain fell upon science in the Western World, not to rise again until modern times." The contemplations of Thales and his contemporary Ionian philosophers on the phenomena of electricity were forgotten.

The decline of Rome was constant after the last of the great emperors, Marcus Aurelius (121-180 A.D.). The end came in 476 A.D. when a Teutonic ruler displaced the last Roman emperor. However, the organization of the Christian Church had, by this time, spread far and wide and greatly affected the course of the barbarian invasions and all that followed. Whether one is a Christian or not there developed from the death of Christ a faith and an institution which have profoundly affected the character and history of all Western civilization.

Following the end of the Roman Empire came the period which is known as the Dark Ages. This period is supposed to have lasted until the death of Charlemagne in 814 A.D., but world history cannot be fenced off by such specific dates and the ninth and tenth centuries were little better than the eighth. It was followed by the so-called Middle Ages which passed their peak and were declining by 1300, to be followed, after a period of transition, by what is popularly known as the "Renaissance."

It was only after the fall of the Roman Empire that alchemy became a part of valid history. The alchemists are sometimes called the "chemists" of the Middle Ages. When this "art" or "science" first began its long career is not known with any certainty. Mercer tells us that "the art properly called 'Alchemy' arose in the second or third century of the Christian era," and that "it resulted from a unison of the practical art of the Egyptians with the philosophy of the Greeks, and with the mysticism which found its home in Alexandria."

WHAT is alchemy and what relation, if any, does it bear to modern science and achievements? To answer, even partially, such a question, a brief survey of the work, knowledge, beliefs and philosophy of the alchemists over a period of many centuries is necessary. To dismiss it and its devotees or adepts as the product of superstition, error, folly and fraud is to be absurd. Its followers were some of the most picturesque and famous personages in the history of European civilization. And just as astrology has resulted in astronomy, and natural magic in physics, so has the modern science of chemistry issued from alchemy. One must disregard the follies, push aside the charlatans, and fix his attention on those inquirers who, in dark and difficult times, experimented and observed, and who handed on and added to our stock of human knowledge. These were the true alchemists and by their work must alchemy be judged.

Modern thought is inclined to view alchemy as a search for that mythical and non-existent substance. "The Philosopher's Stone," by means of which the base metals could be transmuted into gold, accompanied by a search for the "Elixir of Life." Viewed from the standards of our own times and scientific knowledge, it is difficult to conceive of the alchemist proceeding along lines quite as scientific—according to his knowledge—as our own methods. But if one will regard his knowledge and conception of matter as well as his crude equipment and other facilities, he will find that the true alchemist approached his subject quite as scientifically as, for example, the head of any great research laboratory in the United States approaches his work in the light of his present-day knowledge and equipment.

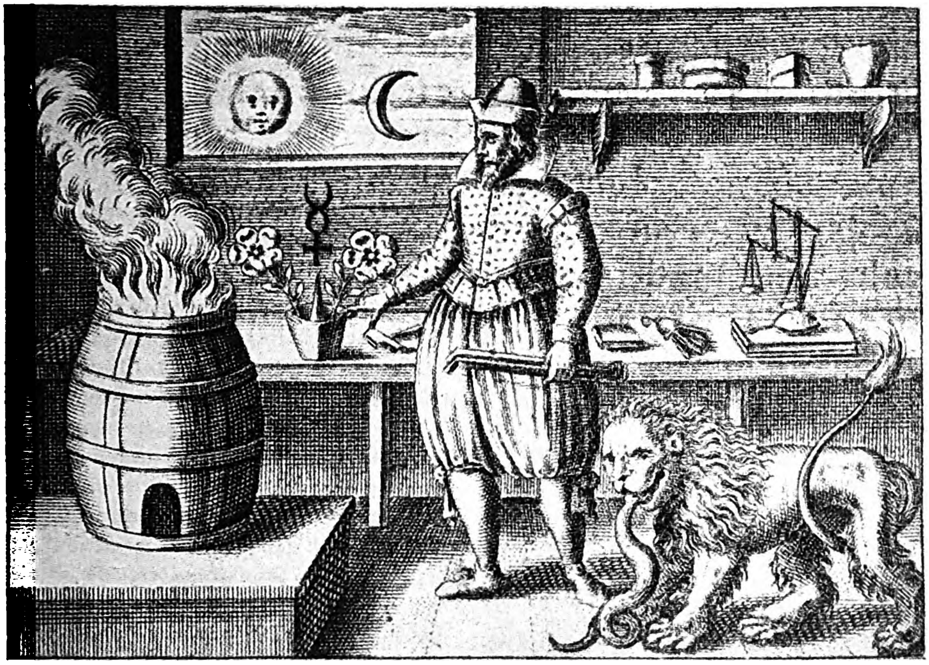
Consider for the moment the regard in which research in pure science is held today. Within the last few years there has been established a great National Research Endowment to be administered by the National Academy of Sciences with a fund amounting to many millions of dollars. The general purpose of this Endowment, according to a statement issued by the Board of Trustees, "is to increase and strengthen American contributions to the mathematical, physical and biological sciences by the creation of a national fund to aid skilled investigators." The light and power industry together with the electrical manufacturers have pledged $3,000,000 to this fund, and this is only one of many great contributions. What would the old alchemists have accomplished with such encouragement?

FIRST, the alchemist observed all about him a universe in what Heracleitus an early Greek thinker, called an eternal "flux." Take a few examples given us by Mercer: Water evaporates: vapor condenses into water. The fuel on the fire disappears in gases and smoke, leaving but a dead ash; the dead ash, in turn, may go to the building up of living plants and animals. Foods are taken, and form flesh and blood; the body decays and returns to the dust from which it sprang. Mercury can be heated so that it becomes a bright red powder—a substance with almost the opposite qualities. Or, take a case which puzzled that clever scientist and sound investigator, Van Helmont, when he tried to account for the growth of a plant. Mercer tells us that "he put a willow weighing 5 pounds into 200 pounds of earth previously dried in an oven, and watered it regularly. At the end of five years he found the plant weighed 169 pounds, whereas the earth, after redrying, had lost only 2 ounces in weight. What was he to conclude? He had not the means of knowing the real nature of water, nor of the carbon dioxide absorbed from the atmosphere. His answer, therefore, seemed to be irrefutable that the 164 pounds of woody matter, leaves, roots, and so forth, were produced by the water. That is to say, the water to all appearance had been changed into a variety of solid substances. A clever scientist was thus forced to a conclusion which was quite in harmony with alchemical doctrine, yet grievously out of harmony with the facts. A modest amount, then, of historical imagination would enable the proud or cynical modern to realize that to be an alchemist was not necessarily to be a fool."

The modern scientist holds that there are more than 80 different kinds of elements which are, relatively to our power of dealing with them, fixed and unchangeable. But the alchemist had quite a different idea. He assumed that all the different kinds of substances are "fluid," so to speak, and pass naturally from one form to another. He conceived each kind as actively striving to develop or grow to a nobler state. His task was to hasten, by special means, what is essentially a natural process. And so, being busy with metallurgy and chemistry, and having noted that fire would make such a startling change in mercury, it seemed to him that it should be a simple matter to change tin into silver or brass into gold. Turning to Roger Bacon, who is sometimes regarded as the herald of modern science, we find him discussing the possibility of transmutation in the Second Book of Aphorisms, as follows:

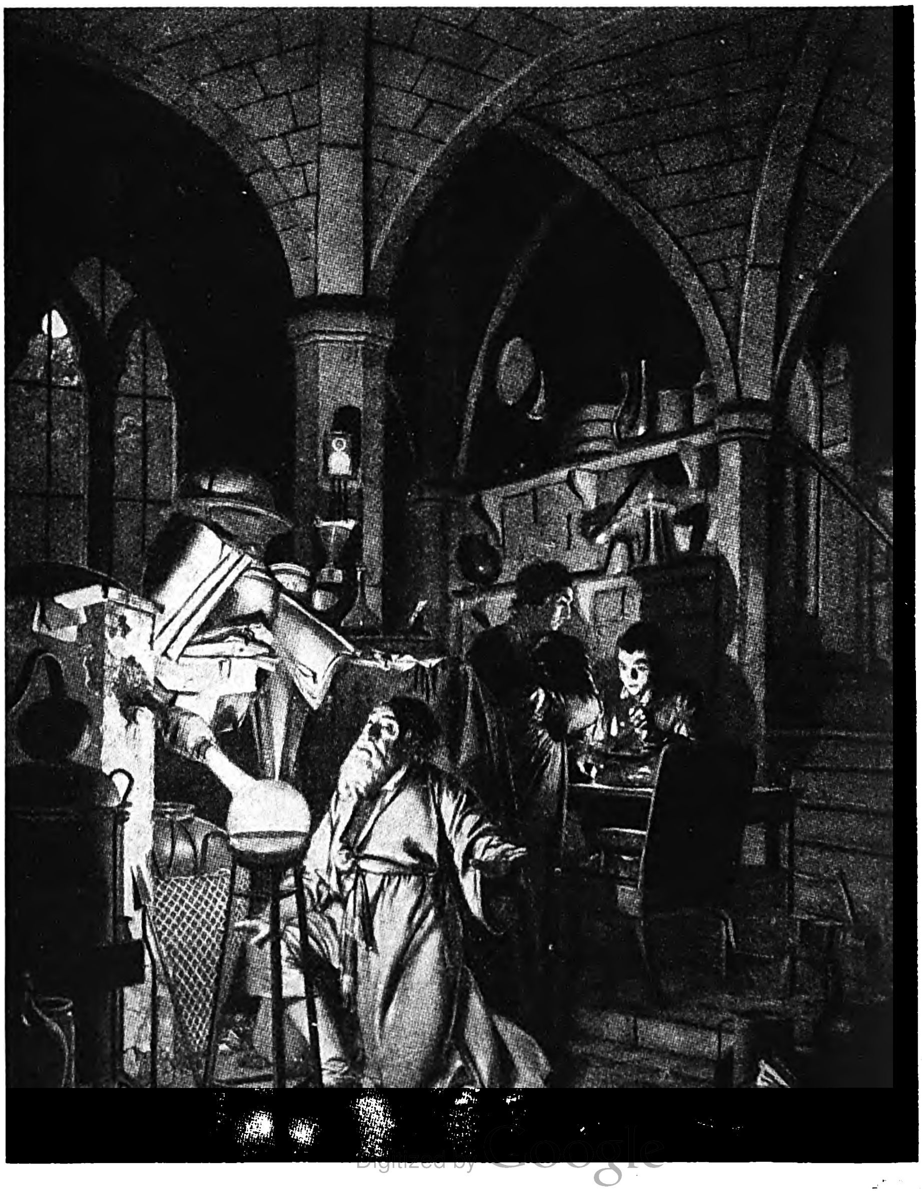
"In gold, for example, the following properties meet. It is yellow in colour, heavy up to a certain weight; malleable or ductile to a certain degree of extension; it is not volatile, and loses none of its substance by the action of fire; it turns into a liquid with a certain degree of fluidity; it is separated and dissolved by a particular means; and so on for the other natures which meet in gold. . . . He who knows the forms of yellow, weight, ductility, fluidity, fixity, solution and so on, and the methods for superinducing them and their gradations, and modes, will make it his care to have them joined together in some body whence may follow transformation of that body into gold."

THE alchemists were always deeply impressed by the processes of growth of plants and animals, and many of them adopted the idea that inorganic substances, and more particularly metals, were endowed with a kind of life; they adhered to the fundamental principles of "Animism." They imagined metals progressing in the earth



THE ALCHEMIST

Two artists' conceptions from "Alchemy—Its Science and Romance," by the Right Reverend J. E. Mercer, D.D., sometime Bishop of Tasmania. Courtesy, the MacMillan Co.



toward perfection, not by changes of a purely physical process, but by a living process. To them they grew like plants. They could see no reason why they could not speed up the slow processes of nature by artificial means just as modern chemistry aims at speeding up divers natural processes. Gold was the perfect metal while iron, tin or lead were imperfect metals striving toward perfection.

With these ideas in mind, what could be more natural than that the alchemist should turn to the problem of turning baser metals into gold? All he needed was a transmuting agent. So their search was for what has become known as the "Philosopher's Stone," a substance presumed to possess perfect qualities which, when combined with other bodies, would act on them; in the case of the base, or imperfect metals, it would purify them and change them into the perfect metal, gold. This stone was variously described: It was a "red powder," a "solid body the color of a ruby," the "color of saffron in powder but heavy and brilliant," the "color of sulphur," "united in all colors." Zosimus, the earliest extant author on alchemy, keeps to the old style. He says:

"In speaking of the Philosopher's Stone, receive this stone which is not a stone, a precious thing which has no value, a thing of many shapes which has no shapes, this unknown which is known to all . . . its kind is one, its species multiple. All comes from the one and all returns to it." An evasive, antithetical paradox, to the modern scientist.

It was also taught that the "stone" had additional virtues such as the ability to make precious stones, diamonds, pearls and rubies, that it could revive dead trees, that it had all sorts of life-giving properties. Health was quite as much an object of anxious longing as wealth in the Middle Ages, and there was an almost universal belief that the "stone" could be used as a panacea for all sorts of bodily ills. It was "akin to the soul of the world" and could influence man's mind as well as his body. Salmon writes: "Those who are happy enough to have possession of this rare treasure, however wicked and vicious they may have been, are changed in their manners and become good people; so that no longer deeming anything on earth worthy of their affection, and having nothing to desire in this world, they sigh for nothing but God and eternal happiness." Norton writes: "The Philosopher's Stone brings to each, succour in his needs; it rids man of vain glory, of hope and of fear; it takes away ambition, violence and excess of desires; it sweetens the hardest adversities. God will place among his saints the adepts of our art." It may be seen that there was a strong religious flavor to the creed of the alchemists.

The laboratory of the mediæval alchemist was not only a place to work, it was often a place of religious exercises. It was frequently equipped with an altar before which the sage would offer prayer for the success of his experiments. There was an atmosphere of mystery and devotional fervor. In the *Mappae Clavicula* there occurs a direction like this: "The Making of Gold.—Prayer you are to recite during the operation, or the fusion that follows, in order that the gold may be formed." And so we see that alchemy was not a science in the modern sense but a mixture of science, philosophy, theosophy, and mysticism. The apparatus of the laboratory was devised for practical uses, and it is interesting to note that many of the vessels still retain their places, and even their specific forms, in our modern laboratories.

ROGER BACON (1214-1292) was one of the first to break away from tradition and explore new territory. For a long time he was supposed to be an alchemist of the orthodox kind and was even branded as a sorcerer. The fact is, he joined hands with the Arabian, Rhazes, who said: "The secret of chemistry is possible rather than impossible. Its mysteries are only revealed by dint of hard work and tenacity. But what a triumph when man is able to raise a corner of the veil which covers nature." Bacon corrected the Julian calendar; analyzed the properties of lenses and convex glasses, invented spectacles for the short-sighted; propounded the theory of telescopes; prepared the way for the discovery of gunpowder and the air pump; and drew attention to the part played by air in the process of combustion.

While we may ridicule and hold in contempt the alchemist and his work, we must realize the difficulties under which these alchemists worked.

Down to the days of the discoveries by the great chemist Lavoisier, there were no known fixed elements to serve as starting points. It was thought that all matter was endlessly transformable, backwards and forwards. Problems that are quite straightforward for us were hopelessly baffling and complex to the alchemists. Furthermore there was a practical side to the effect produced by constant failures. As Mercer tells us: "Kings and rulers who patronized alchemists looked for tangible results. How fared it, then, with adepts who disappointed them? Some saved themselves by plausible explanations—some by flight. Not a few suffered severe punishments or perished by untoward fates. Honest professors who failed came off no better than deceivers and rogues—it was the fact of failure that really mattered. It was thus that a female adept, Marie Ziglerin, was burnt by Duke Julius of Brunswick in 1575. David Benther killed himself to avoid the anger of the Elector Augustus of Saxony. Bragadino was hanged at Munich in 1590 by the Elector of Bavaria. William de Grohnemann was hanged by the Margrave of Bayreuth, who, with grim irony, had this inscription posted on his gibbet, 'I once knew how to fix Mercury, and now I am myself fixed.' Some were invited to courts and then imprisoned until they fulfilled their promises. The device became so common that wise alchemists learned to avoid even the most flattering invitations. Thus strangely were intermingled tragedy and comedy—naïve fanaticism and gross fraud. Mediæval alchemy was in harmony with the spirit of its time."

The history of alchemy is a fascinating one and has been the subject of many volumes. In returning to our original question, "what relation, if any, does it bear to modern science and achievements," we might very well leave it with Aesop's fable of the husbandman who, when he died, told his sons that he had left a great quantity of gold buried underground in his vineyard; "and they digged all over the ground, and gold they found none, but by reason of their stirring and digging the mould about the roots of their vines, they had a great vintage the year following," to which Bacon adds: "so assuredly the search and stir to make gold hath brought to light a great number of good and fruitful inventions and experiments as well for the disclosing of nature as for the use of man's life."

Strangely enough, between the times of the early Greek philosophers and the year 1600 we find little mention of the phenomena of electrical attraction. The power of a magnet, which is still mysterious to us, was, of course, much more mysterious to the alchemist. Its power to attract iron in spite of intervening substances seemed to them to be a "spiritual" force, intangible and invisible and pertaining to the inmost natures of the attracting and attracted body. They placed it in the same category of subtle essences, the action of poisons on organisms, supposing that the permeating power was due to some force which should be regarded as "spiritual" in its nature.

YET if we return to the Zosimus description of the Philosopher's Stone, "this stone which is not a stone, a precious thing which has no value, a thing of many shapes which has no shapes, this unknown which is known to all . . . its kind is one, its species multiple, all comes from the one and all returns to it," can we not indulge our imaginations a bit and view electricity as the true "Philosopher's Stone?" Had the alchemists searched for a force instead of a substance, and, finding it, advanced the art of generating it, harnessing it, distributing it, a few centuries, what would have been the effect on civilization and on the history of mankind?

If we consider gold as the symbol not so much of material wealth as of progress, comfort, convenience and happiness, what great transmutations has electricity wrought in the past fifty years? Truly, it seems that it might be considered not only as the "Philosopher's Stone," but also as the mythical "Elixir of Life" brought under control by the modern scientist so successfully that all may share it.

Strange at is may seem, and in spite of the inventions and prophesies of Roger Bacon and Leonardo da Vinci (1452-1519) who said: "The human bird shall take his first flight, filling the world with amazement, all writing with his fame, and bringing eternal glory to the rest whence he sprang," it was not until the close of the Elizabethan age that electricity began to receive serious scientific attention.

NOTE: The author wishes to acknowledge his obligation to Geoffrey Parsons for his splendid work "The Stream of History" and to the Right Reverend J. C. Mercer, D.D., sometime Bishop of Tasmania, for his "Alchemy—Its Science and Romances."

Cooperative Competition

A Suggestion for Improving Trade Relations

By C. ERNEST GREENWOOD

What is cooperative competition? As the term is used here, it is a merchandising practice in which the leadership in pioneering and promoting appliance service through the direct sale of appliances is taken by the electric light and power companies, while at the same time they unite the efforts of the general merchandising trades in their communities for periodic or continuous selling. Cooperative competition is predicated on the broad policy that the power company is primarily interested in the total appliance business done in the entire community through which revenue from kilowatt-hour sales can be obtained, and not only in the sale of appliances by the merchandising department.

FOR many years the electric light and power companies were practically the only distributors, other than the manufacturers, of electric household appliances. The power companies for the sake of the load building attendant upon the use of the appliances had pioneered their introduction, as they have continued to do in all new applications of electrical energy to household service.

About twenty years ago the electric contractors, urged by the manufacturers and with the full approval of the power companies, began handling domestic appliances. Within the past decade the wide field offered and the great variety of appliances now manufactured has attracted the attention of the general merchandising trades, so that now appliances are sold in the department, hardware, furniture, drug and other stores. Furthermore, high schedule production has intensified "manufacturer to consumer" selling.

It has been estimated that "other dealers" are doing 64 per cent of the appliance selling in small communities, and 72 per cent in the larger cities. Accepting these estimates as facts or as a trend, it is apparent that a striking growth in distribution by the general trades has developed, notwithstanding the charge of unfair competition which has been made against the power companies.

Mr. Greenwood is Commercial Director of the National Electric Light Association. Prior to his work with the Association, he was for many years in charge of merchandising activities of the Edison Electric Illuminating Company of Boston.

The similarity of names might be confusing if it were not reported that Mr. C. Ernest Greenwood, and Mr. Ernest Greenwood, author of "Aladdin U. S. A." and "Prometheus U. S. A.," whose serial "Behind the Veil" is now running in the Bulletin are two entirely separate and distinct gentlemen.

This charge naturally is regretted by the power companies and efforts have been made and are now being made to come to a better understanding of the mutual rights of other dealers and the power companies. As early as 1912, with the desire to be helpful to the dealer, and yet not retard in any way the progress of the appliance load development, the power companies approved the appointment of a joint committee of jobber, dealer, contractors and power representatives at the N. E. L. A. Convention at Seattle to recommend cooperative methods of selling. This was probably the earliest recognition of the electrical contractor as a factor in appliance distribution.

Without doubt we would have been further along the road to a harmonious solution of the appliance merchandising problem and to a fuller mutual understanding if the war had not intervened. During this period the public utility had to solve problems of production rather than distribution, and the merchandising phases of the business were emphasized much less than other objectives. With the problem of production of power solved to a high degree, there again came the pressure for fuller utilization of investment in power houses and facilities. Again the power company felt the urge to promote with utmost vigor the building of the appliance load. Such action was essential in the interest of the security holders, and in the larger sense, the public interest.

WITH the war came a rise in the cost of labor, material and other factors in the production of electrical appliances. The natural result was an increase in retail prices which influenced the method of retail selling. Also during and after the war, appliances such as electric refrigerators, ironers, ranges and washing machines were developed or improved. The cost of these large appliances was such as to make it difficult for people in ordinary circumstances to pay cash for them. Another important factor in the situation was that, due to the abnormal conditions of the war and post-war period, the public appreciation of the value of electrical appliance service had not kept pace with the rising manufacturing and improvement costs.

It follows that the power companies were forced to meet the conditions they found themselves confronted with. The automobile industry, the furniture and musical instrument dealers and, in fact, dealers of most all types of commodities had gone over to the installment plan method of selling. The solution of the power company's problem obviously lay in the adoption of merchandising methods to fit the conditions imposed by the times. This, in short, was selling of appliances on terms and conditions which would attract the public. Without this, many consumers could never have enjoyed the benefits of appliance service. The result of the modern merchandising methods was that a much greater business was drawn to the sales rooms of the power companies.

The increased commercial vigor of power companies intensified relations with other merchandisers. It is not surprising that other dealers handling electric lines were disturbed by the trend of sales.

THE desire of the power companies as a whole is for amicable relations with other dealers which will be to the mutual interest of the dealers, the utilities and of the public. The power companies contend that it is in the interest of the general merchandising trades, as well as their own, that they merchandise appliances to the public. Representatives of associations of the independent trades agree, but rightly contend that merchandising practises of the utility shall not discourage other merchants in the sale of electric devices.

Three conferences between unprejudiced leaders in the principal electric and dealer trade associations have been held during a fifteen months' period, and early in 1928 there was drawn up "A Declaration of General Merchandising Principles." The National Associations participating in the conferences represented the dry goods stores, retail and wholesale hardware establishments, electrical dealers, furniture stores and druggists, in addition to power companies. The principles were approved by the Commercial National Section, and the National Executive Committee, N. E. L. A. The principles are significant in that they are general governing principles laid down by mutual consent as a basis for cooperative competition.

These principles are as follows:

> Since the efforts of the power companies form the only continuous means of promoting the sale of electrical appliances, we believe the best interests of manufacturer, dealer and consumer require the continuance of the merchandising activities of power companies, and that the following general principles should be observed:
>
> 1. All discussions of the problems of the relations of power companies and dealers selling electrical appliances must be based upon proper and adequate service to the ultimate consumer.
> 2. There should be a segregation of the accounting of the merchandising departments of power companies from their public utility functions and all items of expense incurred in the merchandising of appliances should be charged to the merchandising activities.
> 3. It is recognized, however, that expenses incurred in the pioneering of appliances which have not yet met with sufficient public acceptance to be merchandise items in the stocks of local progressive dealers, and general advertising for the development of the market for appliance service, should properly be charged to the promotion accounts of the power companies and not charged to merchandising.
> 4. This conference recommends to power companies and independent dealers the necessity of constructive cooperation in their local fields for the better development of the electrical appliance business.
>
> Lew Hahn, Managing Director, National Dry Goods Association.

>
> Samuel C. Henry, Secretary, Nat'l Assn. of Retail Druggists.
>
> Paul S. Clapp, Managing Director, National Electric Light Assn.

THE Merchandising Committee of the National Electric Light Association gave considerable attention to the demands on the power company for business promotion, and the effects of various selling policies on the independent trades, and after extended deliberations arrived at conclusions which were embodied in "Suggested Standards," and these have been published by our Association as supplemental to the "General Principles." They were designed to assist in quicker acceptance and more accurate interpretation of the principles.

Dealer dissatisfaction, which was expressing itself in numerous communities, indicated that there was an element of incompatibility between the "public interest" and "dealer interest" in the promotion of electric appliances, and the suggested standards of the Merchandising Committee appear to be sound and reasonable middleground on which the utility can proceed without handicap to its paramount duty of selling the public greater utilization of electric service.

In performing this public responsibility for electric service, the power company will strive to promote the welfare of the whole trade. It need not give up appliance merchandising, a practice through which both the public and trade are benefited. On the other hand its merchandising should be on sound business principles which will make it a fair leader. Destruction of trade competition in the sale of electric devices would not be in the public interest, and it is most unfortunate when any selling policy of the power company causes this or creates an impression that monopoly of the appliance selling field is the objective.

A "MIDDLE GROUND" for the merchandising practice of the utility company is "Cooperative Competition" through which the power company justifies its place of leadership in merchandising, adds to the breadth of its service to the public, and while doing this builds a trade good-will which merits an important place in the asset column.

We find a happy situation created by cooperative methods where they have been tried. Cooperative action may be "through the dealer plan," as in Fresno, Cal.; or in the form of subsidiary operation, as in Pittsburgh, Pa., where the Commercial Department of the company promotes for the entire trade, and its subsidiary takes its place in competition with other dealers. But that separate organization is not required is indicated by the Boston plan. There the utility contacts with the dealers in all selling activity, and vigorous merchandising both by the company and dealer is solving the trade problem. In many other power companies between the coastal extremes of Fresno and Boston, the trade is offered encouragement through cooperative activities, yet without slackening selling competition.

That healthy competition is the life of trade is as true today as when first uttered. "Cooperative Competition" is a live and let live policy put into practice. It helps build other substantial merchandising outlets for electric devices. It invites closer acquaintanceship and better understanding, which cannot fail to yield liberal returns as points of contacts are multiplied, because joint effort among those merchandising in the electrical field creates a more sympathetic reaction on the part of the homemaker to the wider use of electricity.

Cooperative Competition will ultimately build a greater and sounder appliance business in the community, because it will build more and better dealer outlets. It is presented as sound merchandising practice for building our domestic appliance load.

Cashocka!

Bass Fishing in the Muskegon River. What a Power Company Did for the Sportsmen

By Ed. Dreier

Reprinted, by permission, from *Field and Stream*

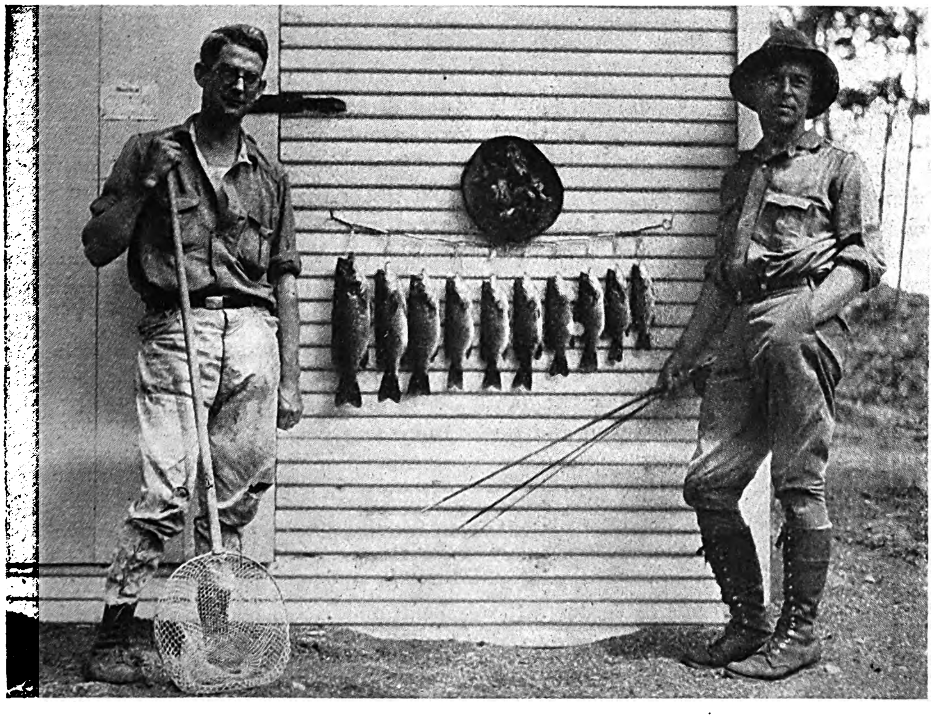
YOU may have heard of the Muskegon. You have, if you know anything about Michigan. A few years ago it was one of the chief topics of conversation and conservation. This river was dammed by the Consumers Power Company, and the Power company was damned by the fishermen. There you have it. The natives raved and swore in all the various languages they knew. Fishermen from other States came in and added their swear words. They taught the natives a lot of new ones that have been handed down from father to son, and even to the females of the species.

Ask some of these folks, "How's fishing on the Muskegon?" and you learn something. You learn words Webster never even thought of. And you don't have to read any books to know the history of the Consumers Power Company. You'll get it, away back to the time the company was first conceived, and you'll get it lurid.

The Power Company Puts Them In

Over 5,000,000 fish including bass, perch, trout, grayling, blue gills and pike have been planted by Consumers Power Company in waters adjacent to company dams in carrying on conservation work.

The Consumers Power Company was serving the people—serving industry. These great waters had to be used for something besides homes for fish. Dams were built and power plants put in. Homes throughout the country were given service. Factories hundreds of miles away used the power to turn their wheels.



—And the Fishermen Take Them Out

Mr. Schopps and the author, with a limit catch made in two and one-half hours with fly rods.

Perhaps it would have been right had the Power company gone ahead and used the water and said, "To —— with the fishermen. They've razzed us to a fare-ye-well. What do we care about them?" But they didn't. Right away they started planting fish in the great back-waters which were created by the dams. Year after year they dumped can after can of fry and fingerlings. They began planting trees along the banks. Thousands upon thousands of trees were planted by the reforestation forces of the Power company.

Operators at the power plants were instructed to keep close tab on the screens to see that fish were not killed by the suction of the waters. Fish ladders had to be inspected. Anglers had to be watched and kept away from these ladders. And each year more cans of fry and fingerlings were planted—increasingly large amounts.

All this time some of the fellows were making their regular pilgrimages down the river from Rogers, from the Big Eddy, from Croton, from Newaygo. There were stories of tackle being smashed; of so many fish being caught that anglers put the smaller fish back into the streams and kept only those going two pounds or more. The skeptics listened and shrugged their shoulders. They wouldn't believe. The fishing had been spoiled.

Ed Schopps, who makes the river trip twenty or thirty times a year, waxed enthusiastic to me about the fishing—told me I'd never go back to lake fishing after one trip down the river. Like the rest of the poor fools, I grinned at him, for I, too, had heard about how poor the fishing was on the Muskegon. And I had been reading in the sportsmen's magazines the stories of all the famous bass fishermen. They talked of streams in Minnesota, in the Ozarks, in Florida and in Canada, but they never mentioned Michigan. So there just couldn't be any fishing worth while in this dammed and damned water of the Muskegon.

HERE ARE THE FACTS

on municipal operation of light and power utilities in the United States.

Up-to-date, recently published at the headquarters of the National Electric Light Association, the new edition of *Government (Political) Ownership and Operation and the Electric Light and Power Industry* represents the most complete information on this subject that has been made available.

The book represents most careful research and is a distinct and valuable contribution dealing with this vital problem of the industry and government.

Here, in one book, are the cities and towns that have changed from municipal to private operation of their power companies.

Here are authoritative opinions from industrial leaders and other well-known individuals and organizations on this important subject. Includes historical material on the power industry and the beginning and present status of municipal operation as compared with private operation.

Subjects are arranged for easy reference, with bibliography and index.

Contains 530 pages. Bound in maroon board covers, lettering in gold. Prices, plus transportation:

1 to 10—$1.50 per copy
11 to 25—$1.40 per copy
26 to 100—$1.30 per copy
101 or more—$1.25 per copy

NATIONAL ELECTRIC LIGHT ASSOCIATION
420 Lexington Avenue New York

BUT I went because I like Ed Schopps, and in my heart I had the feeling that there would be a good laugh at the end of the trip and it wouldn't be on me. We slid the boat down the steep bank and into the foot of the Big Eddy about seven o'clock one fine morning. The fly rods were set, and I tied on a deer hair mouse to try in the slow water of the eddy. Ed pulled away from the shore, and I carelessly tossed the mouse out to strip some line. There was a swirl, and I sat there petrified—the biggest case of buck fever a man ever had. I saw that fish spit the mouse out. What's the use of telling you how big he was?

The rest of the eddy brought no response, and I switched to a feather minnow. Just above the first rip I put the minnow on shore, and as he slid into the water there was an explosion.

"Cashocka!" yelled Ed, and he pulled into the current.

Six times that fish went into the air before he hit the rips. We dropped anchor and eased the boat down through for nearly two hundred feet. We netted him in the quiet water below. He weighed 3½ pounds.

Two hundred feet below, another shore cast brought a smother of spray, but I was too eager, and we had to go on. Ed never goes back for a fish when he misses. That one is left for another day. We took a two-pounder just a little farther on. He was a sulky brute—just wouldn't come up until the pressure of the rod got so great that he had to, and he fought all around the boat before we slid the net under him.

Ed got the next three fish in three casts, and I took two more—all in less than half a mile. At noon we had eight fish, with three-quarters of the way still to go. Two more were picked up in less than half a mile, and we were done for the day.

We raised two rainbows shortly after that and missed both of them. One would have been good for four or five pounds, while the other would have gone two. I know there are rainbows in that stream, because I watched the conservation men transferring fish weighing up to eighteen pounds from the dam at Newaygo to the waters above Croton, and on the same day we fished for bass some one below the dam got two rainbows, one of seven and the other of five pounds.

There are wall-eyes that give one a mighty stiff battle in the swift water, and it is common for the anglers below the dam to get fish up to eight pounds and more. Ed Schopps came down the river twenty-five times last year, and his companions had their limit on almost every trip, the largest bass going over six pounds. When you get a six-pound small-mouth in the fast waters of the Muskegon, you have something that leaves a thrill for many a day, if they fight anything like the two-pounders.

Almost everybody in Grand Rapids knows Ed Schopps, and Ed knows the river. He knows just where to put the lure to get a strike. He will tell you the days when you will and when you won't and direct you to guides who know the river and love it the way he does.

Maybe some day you will want to fish this river that was "spoiled" by a great power company. I wish some of the other streams were spoiled like this one. What a fisherman's paradise they would be!

NEARLY every line of business is organized in a trade association and nearly every city has its chamber of commerce. The one form of organization is to advance the interests of a particular line of business or trade and the other to advance the interests of a city or town. And through such association we are learning about the humanities, about economic facts and ethical conduct, and it makes for improved method and—more certain accomplishment.—*Colvin Brown, U. S. Chamber of Commerce.*

James H. McGraw Prize Paper

Industrial Electric Heat

By B. M. Riker

Editor's Note: Mr. Riker's paper won the James H. McGraw first prize for 1927-1928, awarded last June at the 1928 N. E. L. A. Convention at Atlantic City. Its length makes it impracticable to publish it in its complete form in the N. E. L. A. Bulletin. The following abstract prepared by A. B. Morgan of N. E. L. A. Headquarters Staff will indicate the scope of the paper. The complete paper will be loaned to anyone desiring to study it, upon application to the Secretary, National Electric Light Association, 420 Lexington Avenue, New York, N. Y. Mr. Riker, the author, is with the Commercial and Industrial Department of Charles H. Tenney & Company, 200 Devonshire Street, Boston, Mass. The paper is divided into the following sections, of which the foreword is printed complete:

- Foreword
- Industrial Electric Heat
- Fundamentals and Heat Calculations
- The Advantages of Electric Heat
- As It Affects Costs and Production
- Heating Equipment
  - a. Melting Pots
  - b. Industrial Ovens
  - c. Metallic Resistor Furnaces
  - d. Melting Furnaces
  - e. Impregnating Tanks
  - f. Electric Welding
  - g. Miscellaneous Heating Equipment
  - h. Control Equipment
  - i. Commercial Cooking Equipment
- Annealing of Non-ferrous and Ferrous Metals
- Glass Annealing
- Heat Treating of Steel
- Galvanizing and Sherardizing
- The Heating Engineer and the Central Station Sales Policy
- Conclusion

Foreword

"THE interesting story of the electric light and power industry, and of other industries that have played a major part in the progress of civilization, might well be set up as a series of developments. And, it is interesting to note that in passing from one stage to the next, the cost item has not been a vital factor.

"This is well illustrated by the fact that in replacing the horse with the automobile, horse cars with the modern street railway system, kerosene lamps with the electric light, etc., etc., there has been a material increase in cost in each instance. Nevertheless, improved processes and superior mechanical devices have found, and will continue to find, warm welcome awaiting them simply because the advantages and conveniences which attend their adoption easily overbalance the cost factor on the scales of commerce and industry.

"The manufacturers of today, ever awake to the importance of constant improvement in the quality of their products have brought about a demand, hence, a rapid development of electric heating apparatus. The advantages inherent to the use of electricity as a heating medium are daily becoming more obvious to them and to their trade as well, who are in turn demanding electrically treated products.

"The introduction of electric heat has set up new standards of comparison in industrial production and has been responsible for actual operating results that have hitherto been considered impossible. It has brought about the organization of a swiftly increasing number of Industrial Heating Sales Departments within the central stations, and made provision for the training of engineers and salesmen who can extend this new branch of central station service into industrial centers.

"It is likely, indeed, that when the story of electric heat has been completely unfolded, it will parallel closely that of the electric motor, which, when introduced to industry as an economical and reliable source of mechanical power, bumped squarely into industrial traditions, intrenched behind barbed wire barriers of generations of antiquated shop practice. The electric motor came into its own because its advantages were so obvious that industry demanded it. Once placed, it acted as a superior salesman for more of its kind. The electrically operated heating equipment of today is making its place in very much the same manner.

"We may well point out here, that from the viewpoint of the central station, electric heating load should be classified as a load of exceptional character. It quite often is of a continuous nature, comes on during the off-peak period, and maintains a high power factor. Further, it shows a much greater consumption per kilowatt connected and, subsequently, a greater return on plant investment than the ordinary power load."

Industrial Electric Heat

In the Section entitled, "Industrial Electric Heat" the wide application of the use of electricity is summed up as follows:

"There is hardly an article of commerce today that is not subject at some stage in its production to heat treatment. Practically every shop, factory, and industrial plant is a prospective customer for heating apparatus; and each day brings to light some new operation where the application of electric heat will prove advantageous.

"The chronological development of the use of electricity to the various types of heating is also covered in this section and it is pointed out that less than 10 per cent of the field of application of electricity has as yet been developed."

Fundamentals and Heat Calculations

The Section on "Fundamentals and Heat Calculations" contains practically all of the formulas which the average industrial engineer will find of value in his work. Each formula is accompanied by descriptive text giving the application of the formula to the daily problems encountered by the industrial engineer.

Advantages of Electric Heat

The Section covering "The Advantages of Electric Heat" tabulates the following items wherein the use of electricity is a distinct advantage:

ECONOMIES

1. No fuel or ashes to handle.
2. Automatic control reduces labor factor.
3. Lower maintenance.
4. Better quality product.
5. Increased production through shorter heating cycle.
6. More uniform products through heat regulation.
7. Fewer rejections.
8. Definite heat treating data can be obtained.
9. Repetition of results.
10. Improved working conditions.

11. *Lower insurance rates (elimination of fire hazard).
12. Lower accident rates.
13. Better plant arrangement and saving of floor space.

IMPROVED EFFICIENCIES

1. From labor.
2. From material.
3. From apparatus.
4. Less heat loss.
5. Better power factor.
6. Some processes cannot be successfully done with other forms of heat.

It is apparent that when the above items are taken into consideration the comparative costs of fuel are merely incidental and should not be used as the sole basis of comparing electricity with other forms of energy. This section also includes definite examples which indicate that these advantages are not theoretical, but actually result in an appreciable saving in the over-all cost of production.

Heating Equipment

The Section on "Heating Equipment" includes detailed information on the design and operation of Melting Pots, Industrial Ovens, Metallic Resistor Furnaces, Impregnating Tanks, Electric Welding Equipment, Miscellaneous Heating Equipment, Control Equipment and Commercial Cooking Equipment.

Under the heading "Melting Pots" the general formula for the calculation of energy required is given as follows:

$$KW = \frac{W}{3412}\,\frac{(Sp \times Tr)}{(t)} + Lt$$

W = weight of materials
Sp = Specific heat of material
Tr = Temperature rise in deg. F
t = time in hours
k = Thermal efficiency of pot
Lt = Latent Heat of Fusion in B.t.u. per pound

The values for the various metals which enter into the formula are given in the following table:

Material	Weight Lbs. Per Cu. In.	Specific Heat	Latent Heat of Fusion in B.t.u. per lb.
Lead	0.412	0.041	10.6
Tin	0.264	0.058	25.0
Copper	0.323	0.96	77.4
Zinc	0.259	0.94	41.6
Aluminum ...	0.0927	0.219	175.0
Type Metal ..	0.37	0.0388	31.8
50-50 Solder .	0.341	0.043	27.5
Bismuth	0.354	0.031	22.8
Cadmium	0.311	0.056	24.6
Antimony ...	0.243	0.051	72.5

Following the general Division on Melting Pots, the application of the electric melting pot to solder, lead, tin, babbitt, and type metal is covered in detail.

The Division on "Industrial Ovens" lists the following as representative of the field in which the Industrial Oven is widely used in drying and baking processes:

Japanning, Core Baking, Chemicals, Silver, Grinding Wheels, Cereals, Bread and Pastry, Porcelain Drying, Coils, Armatures, etc.

The design and operation of ovens for application to the uses enumerated above are covered in detail. Numerous illustrations covering actual installations are also included.

The Division covering "Metallic Resistor Furnace" includes details on the design and construction of the heating elements and also of the complete furnace. The Box, Car, Lift, Elevator, Pusher, Conveyor, Rotary Hearth and Vertical or Pit type furnaces are also included. The application of electric heating to Vitreous Enameling is also covered.

The Division covering "Melting Furnaces" includes the Direct Arc, Indirect Arc, Induction and High Frequency Furnaces. The advantages of the use of electric melting furnaces are enumerated as follows:

1. Gases over the metal are eliminated.
2. Exact control of atmosphere.
3. Metal may be made close to analysis due to the control of air supply.
4. Decreased metal loss.
5. Alloys may be added to the furnace instead of to the ladle.
6. Speed of production is increased.
7. Superior quality of the product.

This section deals with both Steel and Non-ferrous Metals.

The Division on "Impregnating Tanks" covers the design and operation of this type of equipment when used for the impregnation of coils, transformers, cables, etc.

The Division on "Electric Welding Equipment" describes Resistance, Arc, Automatic and Atomic Hydrogen Welding methods.

The Division covering "Miscellaneous Heating Equipment" includes such items as Cartridge Heaters, Glue Pots, Compound Melting Pots, Soldering Irons, Space Heaters, The Immersion Heater, Steam Boilers and Singeing Equipment.

The Division on "Control Equipment" lists the essential characteristics of heat control apparatus as follows:

1. The instrument must indicate or record easily to within the required accuracy limits.
2. The control contacts should be sufficient in size to carry the current of the relays, as arcing at such points is detrimental to satisfactory operation.
3. The control equipment should be so constructed that any parts subjected to excessive wear may be easily and quickly replaced.
4. The thermo-couple must be so constructed that it is sufficiently sensitive to register temperature changes corresponding to the required accuracy.
5. Finally, the thermo-couple should be given a proper location within the furnace so that the most accurate results will be realized.

The design and characteristics of thermo-couples and their application to millivoltmeter and potentiometer controllers are covered in detail. The results which may be expected from accurate and reliable control are listed as follows:

1. Duplication of firing conditions, and absolute pre-arrangement of schedules.
2. Simplification of firing over periods of varying lengths.
3. More accurate firing standards.
4. Better operating conditions with improved morale of the operators.
5. Appreciable savings in time and labor.
6. Lowered fuel consumption.
7. Fewer (in some cases no) rejections.
8. Lower maintenance.
9. Improved uniformity and quality of product.

The Division covering "Commercial Cooking" treats the application of electricity to restaurants, hotels, tea-rooms, etc., and indicates that the field represents a potential connected load of 3,000,000 kw.

Annealing of Non-Ferrous and Ferrous Metals

The Section on "Annealing of Non-Ferrous and Ferrous Metals" covers the design and operation of (1) The Kenworthy Non-oxidizing, The Conveyor Type Copper Annealing and The Box Type Copper Annealing Furnaces for use in the Annealing of Copper. (2) The Box Type, Tunnel or Pan Type, Roller Hearth and the Conveyor Type for Brass. (3) The Box Type, Car Bottom Type, Conveyor and Pit Type Furnaces for Annealing of Aluminum and (4) The Car Bottom Type for Annealing Steel and Iron Castings.

Glass Annealing

The Section on "Glass Annealing" covers the design and operation of the various types of lehrs. It indicates that the time of annealing is materially shortened, the product is greatly improved, and the percentage of rejections is either lowered or eliminated altogether.

---

*A group of associated insurance companies have recently stated that in the case of a building occupied by a bakery, using electrically heated ovens, the annual net saving to the policy holder would be from 14 to 18 per cent, dependent upon the type of building construction.

Heat Treating of Steel

The Section on "Heat Treating of Steel" includes a description of the various processes involved in the design and operation of equipment used in Hardening, Drawing, Carburizing of Steel and Aging of Cast Iron.

Galvanizing and Sherardizing

The Section on "Galvanizing and Sherardizing" covers the design and operation of equipment for zinc coating of iron and steel. The advantages of electric heat for this work (as compared with a fuel-fired tank) are listed as follows:

1. Constant temperature 24 hours per day.
2. Less heat loss, no loss due to expelled gases.
3. The dross is cut to 1/5 to 1/8.
4. The life of the tank is greatly increased due to the uniform distribution of the heat.

The Heating Engineer and Sales Policy

The Section on "The Heating Engineer and the Central Station Sales Policy" points out that the heating engineer must be thoroughly familiar with the process under consideration and in addition must be liberally endowed with an understanding of diplomacy. The necessity of a systematic schedule is also stressed and according to the author this should include (1) Analysis of the Heating Field, (2) Formulation of an Active Sales Plan and (3) Application of the Sales Plan. In the case of a combination gas and electric company it is advocated that the sales policy should be determined largely by the requirements of each customer and it is strongly recommended that the respective studies covering gas and electricity be judged by an impartial referee in the central station organization to the end so that the customer will get the service which is best suited for his individual needs.

Conclusion

The Section entitled "Conclusion" is quoted directly from the report as follows:

"It has been the object of this paper to trace briefly the fundamental principles of electric heating and to touch upon the essentials of the more common heating processes. We have further endeavored to illustrate, both generally and specifically, the outstanding advantages of electricity when utilized as a heating medium.

"There are, however, a tremendous number of special applications that we have not touched upon. They are, as a rule, applications of widely varying characteristics, common to a specific locality or industry, made possible by the design and construction of special apparatus and by the receptive attitude of alert industrial executives to new and modern methods. Such applications will continue to present themselves in the future just as they have in the past, and the ability of the heating engineer, together with the equipment manufacturer, to determine the economic possibilities of these installations and to cooperate in the design of efficient equipment will be an important factor in placing the electric heating load on par with the electric motor load during the next decade.

"Much has been accomplished during the past fifteen years toward stimulating the demand and improving the supply in this new electrical market. The responsibility of future development lies in great measure with the central station. The advantages of this field to the electrical industry have been emphasized elsewhere in this paper. Outstanding among them is the fact that electrical apparatus of such character will go a long way toward increasing the central station revenue component, when operated on our distribution systems. The market, as a whole, presents a most attractive aspect, and its potential worth is only limited by the amount of effort expended in its promotion."

Electricity in the Household in 1890

In an article entitled "Electricity in the Household," by A. E. Kennelly, one time assistant to Thomas A. Edison and at present Professor of Electrical Engineering at Harvard University, appearing in the January, 1890, issue of *Scribner's Magazine*, the statement was made that "the adoption of electrical household appliances is daily becoming more widespread, here adding a utility and there an ornament, until in the near future we may anticipate a period when its presence in the household will be indispensable."

As confirmation of his prediction, an article under the same title by the same author appears in the April, 1929, issue of the same magazine. This latter article is an account of the advancement made in the past forty years of the art of generation and distribution of electric service with particular reference to its application to domestic use. Readers of the BULLETIN are familiar with the essential facts brought out in the 1929 article and without doubt will concur in his prediction for the next two score years. Dr. Kennelly wrote, "The last forty years have seen a very great development of electrical service in homes and factories. There seems to be no reason why the next forty years may not witness a continued and correspondingly great advance. As we look to the future, the electric switch is still in the ascendant."

From the contemporary standpoint the early article is most interesting for its enumeration of domestic appliances then either in actual or experimental use. "The first application of electricity to household purposes," says Dr. Kennelly, "was presented by the electric bell, early in the century, and annunciators of various kinds soon followed. For many years this was the only convenience it afforded, but the discoveries of the telephone, the electric light, and the electric transmission of power within the last thirteen years have given it a tremendous impetus whose ultimate consequences are not yet within view. Even if, as seems unlikely, these brilliant achievements are destined to stand alone, not succeeded by further discoveries, many years must elapse before their full use shall have been reached; just as in the case of the pianoforte, which took more than a hundred years from its first invention to become the common guest we find it in the household of today.

"In the same way motors have been applied to lawnmowers, to carpet sweepers, to shoe polishers; and, in fact, there is no household operation capable of being mechanically performed, of which, through the motor, electricity cannot become the drudge and willing slave. It has even been applied to serving at table."

Among other uses mentioned were electric coffee pots, clocks, fans, elevators, footwarmers, pumps in country houses, time detectors for watchmen, fire alarms and automatic regulation of temperature by thermostat.

The Westinghouse Lamp Company's New Lighting Institute

By A. E. Allen

Vice-President, Westinghouse Lamp Works

THE Westinghouse Lighting Institute—a complete city block of buildings comprising a model electrical home, stores, factory, school, theater, central station sales office, department store, with streets, roadway and modern street lighting units—is being built on the seventh floor of the Grand Central Palace, a building which itself covers a square block in New York. The institute will be formally presented to the electrical industry by the Westinghouse Lamp Company on June 1, 1929, just prior to the Atlantic City Convention.

The institute is designed as a Laboratory of Light, an educational institution dedicated to the study and teaching of correct lighting practice, a meeting place for scientists, engineers, architects, designers; in fact, all who are interested in the application of artificial illumination to the modern arts and sciences.

Here the industrial engineer may present his plans for the erection of a manufacturing plant, receive advice or check his own lighting specifications, verifying his calculations by actual demonstration and measurement of light output from various types of lighting units. Here the architect may study and visualize through scaled models the flood-lighting of proposed buildings for the purpose of enhancing its architectural lines by night. Here, also, may come the student from technical school or college, the lighting engineer from the public utility, the designer of lighting fixtures, the editor of magazine or trade paper, the merchandise manager of the central station or the dealer in lamp and lighting equipment, each to inspect, study or have demonstrated to him according to his individual interest any of the thousand applications of incandescent lamp lighting, whether it be in the home, commercial or industrial field.

Demonstrators, guides and technical advisors will be available to individuals or groups who may wish to inspect the exhibits, study particular pieces of lighting apparatus, or attend classroom lectures and demonstrations of modern lighting equipment.

An auditorium with a seating capacity for three hundred and fifty persons is a feature of the Lighting Institute, and this will be available for meetings of central station groups, jobber and dealer conferences, as well as for regular meetings of scientific and engineering societies. Current facilities of very wide latitude have been installed so that scientists and research engineers will have every available assistance in their lectures and demonstration work. In fact, the entire equipment, electrical and otherwise, throughout the Institute is of the very latest design, and while the greater part of it is commercially standard, many novel and interesting devices indicate the trend and future application of lighting equipment of which little is familiar to the general public at the present time.

The floor plan of the Lighting Institute is an interesting layout combining many aspects of commercial and industrial activity with the more æsthetic atmosphere of the model home, salon and art gallery. Through the center of the exhibit section runs a twenty-foot street, Mazda Avenue (one hundred and eighty feet long with a cross street at one end and a court at the other). Facing on Mazda Avenue, which is lighted by modern street lighting units, are store fronts of various kinds, including a sixty-foot department store window and entrance. Also there is located on Mazda Avenue a garage, industrial building, theater, bank and fully equipped central station, and electrical dealer merchandising establishments.

Back of the windows and store fronts on Mazda Avenue are located the special exhibits and demonstration rooms covering particular fields of lighting endeavor. Behind the bank front lies the section devoted to electrical advertising wherein are exhibited in working models all the various lamps, reflectors, housings, color lamps, and other paraphernalia for producing the marvelous effects attained in the electric sign industry, finished examples of which are to be seen in operation on Mazda Avenue.

Behind the garage front with its Island Filling Station lies a large section for the testing, focusing and measuring of automobile headlights as well as complete exhibits covering every type of miniature Mazda lamp now manufactured—medical, flashlight, toy train, radio panel, etc.

Next to the garage the visitor to the Lighting Institute finds the Industrial Lighting Section, and behind that a

No. 71 May, 1929

Correspondence for Good Will

By JAMES F. RICE

Correspondence Advisor, Commonwealth Edison Co., Chicago, Ill.

THE average letter is subject to condemnation on many charges, but the principal reason for its indictment is its tenacious hold on the clammy construction and impersonal tone that were so evident in the commercial correspondence of men long dead and almost forgotten.

"Almost forgotten" is a highly appropriate phrase because the wornout forms of expression that glorified the epistles of pen-and-ink days still blossom serenely in the grooved minds of the many "we-beggars" who "wish to advise" that something "will go forward in due time," and "trust" that the "same" will be satisfactory, and "beg to remain" watchful waiters who "hope to be favored" with something or other "by return mail." This quite typical language, which might be described as the kind that comes in cans, neither carries an air of conviction nor contributes anything worthwhile to the tone of a letter. It is bad enough in itself but it leads to something worse—a stagnant point of view, with eventual loss of originality, and the habitual substitution of strained utterance for the sincerity and ease of natural speech.

The Happy Medium

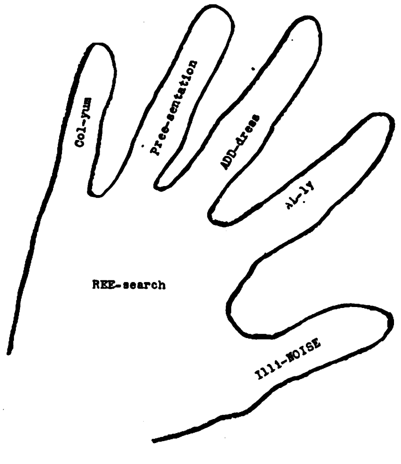
The final effect becomes evident in stilted language by which time and space are frequently wasted when the dictator of correspondence has lost all appreciation of conciseness. Extreme brevity is, of course, utterly undesirable, but there is a happy medium between word-waste and brusqueness. It is called "brevity with completeness," a modern method of expression that certainly does not emanate from a careless acceptance of bad practices established by others. "Do men gather figs of thorns, or grapes of thistles?"

Specimens of Bulletins issued periodically to dictators of correspondence, stenographers and typists throughout the Commonwealth Edison Company.

Correspondence Bulletin No. 181

A HANDFUL OF FLIES

There are still six troublesome flies—gross mispronunciations in the balmy air of Edisonia. Let's exterminate them while we have them well in hand.



(As we were saying, a good dictionary is a good friend.)

Correspondence Bulletin No. 227

REACHING FOR THE SKY

Plain language, such as we use orally, is the language for letters. It is perfectly ridiculous to mount a ladder and try to pull oratorical splurges out of the clouds. The splurge doesn't usually pay for the stress and strain. It is more likely to have the effect of laughing-gas.

"All of our men commissioned to solicit orders from our customers have credentials properly authenticated."

In English:

All our salesmen carry identification cards.

With the advent of the typewriter and the operator trained in the new language of shorthand, came a great opportunity to make the business letter talk. The average dictator did not rise to the opportunity. The beginner, stepping into the shoes of a fellow-worker who has gone a step higher on the ladder, has become merely a faithful follower of forms bequeathed to him in great unselfishness by his climbing predecessor. And when, in his turn, the heir to all the moth-eaten phrasings of past ages has received his call to a higher place at the table of business activity, the fullness of his human heart has prompted him to hand down his collection of scraps to another struggling beginner. This "hand-me-down" process has been one continuous round of pleasure. So the history of business correspondence may be summed up in a line taken, appropriately enough, from "Love's Labor's Lost":

> "They have been at a great feast
> of languages, and stolen the
> scraps."

More Art Than Science

Some speak of improving letters and others of "personalizing" them. Both have the same idea. The old form of letter, still so common in the business world, is nothing more or less than a collection of stilted expressions, showing no individuality and consequently little, if any, personality. Personalization of letters depends to some extent on practice, because letter writing is admittedly rather art than science, but those who have given little or no thought to the subject of correspondence are too ready to look upon letter writing as an art and to remain in ignorance of the fact that a letter may be, to some extent at least, a product of science. It would be absurd to say that letter writing is in any way scientific in the literal meaning of that word, but, as science may quite properly be taken to mean "exact knowledge," there can be no doubt that some scientific principles are applicable to letter writing.

Emphasis of this point is justified by a prevalent tendency to regard letter writing solely as an art. This notion, harmless as it seems, leads many people to the deplorable conclusion that writers are born—not made. Nothing could be farther from the truth. It will be admitted readily enough that writers of great sales letters may have natural endowments that the rest of us do not possess, but it is an entirely reasonable contention that anybody with a fair knowledge of our language can learn to write good letters. Unquestionably, anybody can at least make noteworthy progress in the improvement of his letters if he does nothing more than to overcome his addiction to "stone-age stuff"—forms and phrasings whose only claim to respectability is their white whiskers.

The Vitalizing Process

From a survey of correspondence in almost any organization, it might appear almost impossible to vitalize the business letter without "making the writers over." But the situation is not quite so bad as it may appear. The vitalizing process consists partly in the elimination of what is bad and partly in the introduction of what is good in form and substance. Dictators are normal men and women, with the natural fund of common sense that all mortals possess, and with a ready responsiveness to reasonable suggestion—when their interest has been aroused. More often than not, even a fruitful suggestion needs only to take the form of a reminder to bring substantial results. This is true because carelessness in everyday practice becomes so much a matter of habit that it is a much greater factor than downright ignorance. A rather pleasing proof of this is found in the eagerness of many stenographers to aid in the application of guiding principles given to dictators and in their ready remembrance of prohibitions issued to dictators. The primary cause of poor letters, in a word, lies in the simple fact that men and women engaged in the production of letters have given too little thought to the importance of the capacity in which they serve as producers. They underestimate the importance of letters and the writers of letters. They fail to realize that a letter is intended to be the natural, forceful utterance of an intelligent individual and not merely a rickety vehicle for the drayage of all the stilted and hackneyed word combinations that our ancestors placed in cold storage.

Correspondence Bulletin No. 205

THE FORCE OF DIRECT UTTERANCE

Nobody would walk around the block to cross the street, except, perhaps, some dreamy Romeo. But some of us habitually wade around in words when we have something simple to say.

COMPARE THIS	WITH THIS
In reply to your letter of May 2, with which you returned a bill for $3.89, we inclose a corrected bill for $2.71.	The inclosed bill for $2.71 is to replace the one you returned May 2.
With regard to the meter measuring your service, I can assure you that it is accurate.	Your meter is accurate.
I inclose a check for $1.25 representing the admission fee paid by John Blank in connection with application for membership in the Association.	The inclosed check for $1.25 is to refund the admission fee paid by John Blank with his application for membership.

Notice the easy elimination of *unnecessary* I's and We's.

That is ONE of the virtues of direct utterance.

Correspondence Bulletin No. 5

CARELESS USE OF WORDS

When typewriters were not in general use and business letters were written by hand, every expedient was employed to make them brief. The word SAME was apparently considered desirable from this point of view. But, although the original reason for extreme economy in word usage no longer exists, this valueless word is still used persistently. Unfortunately the fact that it might tend to obscure the meaning of a sentence has always been overlooked.

Consider this typical letter of acknowledgment:

"In reply to yours of the 3rd inst., relative to the shipment of merchandise recently ordered and requesting one of our catalogues, we are pleased to say that the same will go forward tomorrow."

Will both the merchandise and the catalogue be sent?

* * *

How does this impress you?

"The full rate portion on the February bill was figured at 36 Kilowatt hours, and on the previous bill at 40 Kilowatt hours. We are, therefore, at a loss to find where any injustice has been done, and are returning same with the discount date extended."

Is the *injustice* being returned?

* * *

It may be asserted that the meaning in both these letters *will not* be misconstrued. But the ideal letter is the one in which the meaning *cannot* be misunderstood.

It is proper to say: "We enclose your light and power bills, which are for the same period." But we should not say: "We enclose your light and power bills. The *same* are for the month of May."

Correspondence Bulletin No. 160

CONSUMPTION

Consumption is a disease with which electricity is not afflicted.

Those who USE electricity for light or power do not CONSUME it. It is not a fuel or a food. It is not burned up or eaten. It is merely USED.

When we sell a customer electric energy, we sell him something he can and does put to work—not merely something to consume. Consequently, we broadcast a false idea when we speak of "electricity consumed."

"Electricity USED" has sales value. It is a reminder to the customer that he is buying or has bought a USEFUL service, and not merely a load of smoke for his chimney.

Let's abandon "electricity consumed" and "current consumed." and take up ELECTRICITY USED.

Correspondence Bulletin No. 151

THE DETACHABLE FINGER

Do you think any ordinary person can practice two kinds of etiquette? If a child is permitted to use his knife as a carry-all at his own table, will

Improvement Must Be Systematic

The improvement of the business letter is very much like the saving of money: the attempt must be made systematically, and the process is bound to be slow. Spasmodic efforts will be unavailing. On the other hand, a too-intensive criticism will fail to generate interest in an endeavor for which real cooperation is required. The problem is very plain: commercial correspondence must be improved. The only difficulty is to find a method that will give a fair promise of sustained success.

Several years ago the Commonwealth Edison Company made a comprehensive survey of the correspondence situation, and established an advisory system to work upon the two prime factors of letter composition—the dictator and the stenographer. The system was made essentially advisory, rather than supervisory, because the experience of pioneers in the practice had shown unquestionably that help will be received graciously by any progressive employee, but that criticism will be conducive to an attitude of cold resentment. It was felt that advice might be given on a wholesale basis, even under a coercive policy, but the opinion prevailed that any silent opposition to forceful methods would make it difficult to learn the needs of individuals or to enlist their cooperation in constructive measures.

Advisory Service for Correspondents

With an entire absence of unfriendly criticism, therefore, the method instituted and now in operation consists of an advisory service for all dictators of correspondence, as well as stenographers and typists, in the broad principles of correspondence, the solution of difficulties, the correction of undesirable mannerisms, the standardization of set-up, and the elimination of the grammatical and rhetorical errors that are so prevalent in the speech of the day. Advice of general interest that may be regarded as profitable to those involved in any form of correspondence is broadcast in bulletins. Suggestions to individuals are sometimes made in letters and informal notes, but, quite frequently, a personal contact serves better to bring home to the dictator a full realization of some serious defect to which he has fallen victim.

Experience has shown that a short bulletin will be read carefully if it has human interest. Like a letter, it must be a message from one human being to another. It may be, objectively, the product of a duplicating machine, or printing press, but it must have the substance of personal utterance. As a competent physician prescribes specifics rather than patent medicines for specific ailments, so one who hopes to advise dictators effectively must make bulletins specific. This point of view seems to have been proved sound by a sustained interest in bulletins, as evidenced by the duration of favorable comment and the frequency of requests for advice, even in personal correspondence.

Short and to the Point

The desirability of conciseness in a bulletin is so great that it virtually amounts to necessity. First of all, those who read bulletins are busy people who could not reasonably be expected to welcome a lengthy dissertation on any subject. But a more important consideration is that a bulletin, to produce its best effect, must present to the reader some thought that he can grasp quickly. It is all well enough to hope that those who receive bulletins will preserve them for occasional reference, but little is accomplished if the readers do not derive some benefit immediately. It is quite obvious that some one point, presented in a reasonably interesting way, will be absorbed readily by a reader, who is all the more likely to preserve the bulletin and to remember the lesson than he would be if it were to treat several subjects, at a necessarily greater length. It must be remembered, too, that bulletins are sent to high executives, who undoubtedly receive some little benefit occasionally and who may, with little loss of time, maintain a fair degree of familiarity with the nature and the extent of correspondence advice being given to the workers under their jurisdiction.

he use a fork when he is "out in company"? You know the answer.

If you write slipshod sentences in an interdepartmental communication, such as an accident or damage report, do you imagine that some miracle will enable you to write ENGLISH in a letter? That is one miracle you will never see.

Some of our descriptions of accidents and damages would make good material for the vaudeville stage. Just look at this sparkling gem:

"After a few days, his finger became infected and was sent to the office by his foreman to see the doctor."

There's efficiency for you. An injured finger is simply mailed in for repairs, and another "no-lost-time" accident goes into the record.

Correspondence Bulletin No. 201

THE CASE AGAINST "BIG WE"

The indiscriminate use of WE inevitably results in unnecessary and unpleasant use of this pronoun. But, although it is bad enough to make a letter lopsided with WE's the final outcome of the WE habit is the WE attitude—a mental poison.

The following WE utterances are taken from ONE letter:

1. "We are replying to your letter." —An unnecessary use of WE. A poor beginning: a waste of time and space to say nothing.
2. "We want to state."—An utterly useless expression. Just wordiness, to say the least.
3. "We were correct." — The WE ATTITUDE, resulting from needless use of the pronoun. A disagreeable emphasis of OUR position.
4. "We have not made an error."—The WE ATTITUDE again Needless self-justification.
5. "We hope this is satisfactory."—Once again WE are greatly concerned about OUR convenience.

You cannot escape the WE ATTITUDE if you begin most of your letters with WE, and frame about half of your utterances to express what WE think.

Correspondence Bulletin No. 202

THE I's HAVE IT

Mr. Huson, a writer for *Postage & The Mailbag*, gives an excellent word-picture to illustrate his opinion of the WE attitude:

Jones meets Smith on the street one fine morning. He grasps him by the hand and says: "Good morning, Smith; I'm feeling fine this morning. I was a little under the weather last week, but I'm all right again."

"The only thing wrong with this little speech," says Mr. H., "is that no gentleman ever greets a friend by telling him the state of his own health. Usually, he at least assumes an interest in his friend's condition, and greets him like this: 'Good morning, Smith. How are YOU this morning?' "

Now, look at these eight little I's in a small playground known as a paragraph:

"*I* regretted very much that *I* was unable to be present at the conference you called at your office. Unfortunately, *I* was called to a meeting and *I* was unable to get away in time to be present with you. *I* left word with Mr. Brown that if *I* was detained, he was to attend in my place, as *I* knew that he knew as much as *I* did of the details of the matter."

Would these I's look small to a reader, or would they seem BIG?

Correspondence Bulletin No. 142

THE LONG SENTENCE CRAZE

"Mr. Jones was working at Black and White Streets when a steam-grader owned by the Blank Paving Company, which was traveling south on Black Street, when a clutch-band broke, tearing the housing loose, striking John Brown, 8300 Madison Avenue, a helper on the steam-grader, in the left leg, suffering a deep wound which bled profusely."

SOME accident. "The tale of a Suffering Clutch." The bleeding must have been like the alleged sentence—profuse.

"Both men were thrown from the

Many of those who receive the bulletins preserve them. To facilitate filing and reference, as well as the use of an index, every bulletin bears a number and a subject. Matters pertaining directly or indirectly to letter writing are treated under subject headings intended to attract notice and to emphasize the points under discussion. Some of the typical subjects have been:

From the Ark to the Wastebasket
Trustful Souls
Tinker to Evers to Chance
The Rubber Stamp Idea
Talking Turkey
Weak Sisters
One Party We Should not Attend
Old Hobby-Horses
Quick, Watson, the Dictionary!

Public Utility Correspondence

It is fairly evident that a public utility differs somewhat from an ordinary business institution. Its contacts with the public are more varied, and it is held accountable for many acts or omissions even by those who are not its customers. The public utility serves the largest public that is served by industry and depends more than any other business enterprise on widespread good-will. Although the utility is usually non-competitive and distributes or provides a universally necessary product or service, and consequently has comparatively little need of what are commonly called sales letters, it has before it always the inescapable necessity of selling good-will in every letter sent to anybody.

The letters issued by a public service corporation naturally differ in some essential respects from the letters of even a relatively large mercantile establishment. The most outstanding inherent difference is apparent in letters having to do with matters of credit and collection. A mercantile establishment has relatively few customers with whom it must have correspondence on such matters, but the amount of money involved in each case is relatively high. The public utility, on the other hand, and specifically one that furnishes energy for light and power, must deal with an exceptionally high number of customers in the collection of accounts, but the amount of money involved in the average case is comparatively small. Another element of difference lies in the fact that the customers of a comparatively small business can be quite widely known to the people in the organization, while a large public utility can hardly hope for so enviable a situation.

When these essential factors are taken into account, as they must be in any consideration of correspondence, it becomes quite evident that the mercantile establishment can frequently write more personal letters than can the public utility. Yet, it is almost an axiom of modern correspondence procedure that every letter must be a personal utterance—must, in a word, be obviously a message sent by one human being to another, and not merely an assembly of dry phrasings that may have meaning but cannot have what is aptly called "punch" or "pull."

Advertising Value of a Good Letter

Every business, regardless of its nature, is keenly alive to the possibilities of modern advertising. Efforts to interest the great radio public are particularly noteworthy because there is a correspondence lesson to be drawn from the extensive use of the radio for advertising purposes. Those who constitute the radio audience number thousands, and, although it is possible for a speaker to arouse and hold the interest of hundreds, perhaps even thousands of listeners at one time, it is hardly conceivable that he can impress any listener with the fact that the speech is a personal utterance for him. This exemplifies the fact that words sent to the ear can hardly be made elements of personal utterance when the sender must speak to more than one person. The writer of a letter is not called upon to address an audience. He sends words to the eye of an individual, as it were, and whether the utterance is personal, or as general as a talk to an audience, will depend altogether on the way in which the writer performs.

An employee, in his personal contacts with the public, may usually be relied upon to represent his company fairly and to leave no misconception of its motives in the mind of a customer. In conversation, it is only natural for an employee to make sure that he is understood and to dispose of any request or complaint both graciously and effectively. But the writer of a letter lacks one of the advantages of the personal contact. He cannot know the reader's reaction to the typewritten page. More serious still, the tone and manner of expression will live in the reader's mind long after the message will have served its purpose and perhaps have been forgotten. Smiles and frowns are almost equally durable, and the one or the other is quite likely to be the legacy left by a letter.

wagon by the impact, one of them striking the wheel ere reaching the ground, causing fracture of the ribs and knocking him unconscious."

The wheel with broken ribs must have been an awful sight.

Have you a FEAR of that effective little punctuation mark called the PERIOD? If you have, get rid of the fear. A few periods will save you much woe. LONG SENTENCES, shot into the atmosphere without forethought, will drag almost any man into the mud. Long sentences frequently involve dangling modifiers, jangling cowbells that float around like lost souls, as they did in this case.

There is no grain good enough to run a race with a mouth. Whenever a foolhardy individual stages such a race, you can bet all you have on the mouth. It will outrun the brain every time.

Correspondence Bulletin No. 138

HOW "BREVITY" FAILS

"Installation of your service is held for a tree-trimming permit. As soon as we receive it, we will make the installation." That is substantially what was written in reply to a request for information.

Obviously, the outstanding characteristic of the quoted letter is brevity. There is nothing discourteous in either of the sentences. There is nothing radically wrong in the construction or in the choice of words. But does the letter tell an outsider anything satisfactory? He probably knows that two or three more or less mysterious wires must be run from an "electric pole" to his house, but do you suppose the average person can see any connection between service wires and trees?

WE know that trees must be trimmed if they stand in the way of electric wires. Yes; WE know it TOO WELL. We imagine that everybody else knows it.

A BRIEF letter to a customer HINTS much but TELLS practically nothing. When a customer receives a BRIEF letter about the necessity of a tree-trimming permit, who will give him the answers to the questions the letter puts into his mind:

Why is tree-trimming required?
Who issues a tree-trimming permit?
Who applies for the permit?
How long does it take to obtain it?

A CONCISE letter would not necessarily fill a page with words, but it would serve the customer by giving him the information he wants—not merely something to guess at.

Is the difference between BREVITY and CONCISENESS now clear?

Correspondence Bulletin No. 106

BLEACHED BONES

We wish to say.—WISH is a good word in fairy-tales. WISHING implies an almost hopeless longing for someing beyond reach. Say DESIRE if you must use some word of this kind. But why DESIRE to say something? Why not just SAY it? You need not DESIRE to thank somebody: just thank him.

Under date of.—What's the matter with ON? Would you say that you walked down the street UNDER DATE OF October 8? You might walk under a ladder, but not under a date. Letters are written and events occur ON certain dates, but not UNDER them.

Notify the writer.—THE WRITER is a wonderful term IF it is your intention to display all the FALSE MODESTY in your system. What is wrong with little ME? It won't bite you.

Your favor.—A letter is not a favor. We know that some letters are as far removed from favors as a sperm candle is from an incandescent lamp.

Inst. and Ult.—These two insects may have done well enough when Julius Cæsar lived—and spoke Latin. But many changes have taken place since Julius expired. We speak English now because that is the language OUR READERS UNDERSTAND.

This party.—It takes two to make a quarrel, and it takes two or more to make a PARTY (except in legal documents). An individual is a customer, a man, a woman, or a child or something equally as definite.

Stilted Phraseology

Whatever a letter says stands out in bold relief, either as a worthy advertisement of the company or as an indication that a friendly attitude toward customers is not its policy. And just as the writing of a letter must be left to an individual so, too, must interpretation of it rest on just one man or woman who is that most vital factor of all business—the customer. One of the earliest lessons to be learned by one who would improve his correspondence is that the language of business is neither the lofty phraseology of literature nor a collection of stale mouthings that have been appropriately termed "rubber stamps."

The old saying that "Virtue takes a middle course" is as applicable to letter writing as to any other of life's activities, and more so, if anything, because the business letter is effectually a substitute for a personal representative. As a representative knows that the language for a personal approach cannot take the form of oratorical bombast, resembling a Fourth-of-July oration in a small town, so he knows, too, that it must be sufficiently original to be natural if it is to be at all effective. The average letter writer could see this great truth if he would give the matter any thought, but he usually thinks that business has one form of language for oral utterance and something entirely different for what is to be written. The matter of first consideration, then, is to point out to the average dictator the fact that he should write effectually as he speaks.

Experience shows that the individual requires specific advice and that even common defects that are presented to all dictators through the medium of bulletins must occasionally be brought home to him in a personal appeal. But marked improvement in the correspondence of any particular department receives its greatest impetus from what we in the Commonwealth Edison Company sometimes refer to as "group consciousnes." This is nothing more or less than a growing realization, on the part of the several dictators in any unit of the organization, that the business letter is an important factor and merits concerted attention. The attainment of group consciousness in any part of the organization is almost inexpressibly satisfying because it marks the beginning of real cooperative effort to bring about what a correspondence advisor so consistently believes and so tirelessly preaches.

The "We Attitude"

One of the most serious diseases with which dictators are afflicted is commonly called the "WE attitude." In slang, this is tersely defined as the "BIG I." Dictators do not deliberately, or even consciously, indulge in an attitude that prompts them to consider only the company's side of any matter, but, nevertheless, they do indulge in this attitude until and unless they give enough thought to the subject of correspondence to appreciate the fact that a reader's interests and views are of paramount importance, and that what is appropriately called the "YOU attitude" is one worth cultivating.

When one understands that the WE attitude is not only an overuse of the pronouns WE and I, but a presentation of too many utterances indicating selfish consideration, he must see that condemnation of such an attitude is a business necessity as well as a point to be observed constantly in letter writing. As tone depends so greatly on attitude, it is fairly clear that an understanding of the WE attitude and a consistent avoidance of it is one of the major considerations in correspondence procedure.

Beginnings and Endings

Closely related to bad attitude, with all its corollaries, is the consideration of beginnings and endings. Many a letter is an ineffective and verbose composition merely because the writer does not know that the beginning is a strategic position, of which he should take advantage to say something effective in a concise way. The value of an effective ending cannot be stressed too greatly, because, as in practically every rule of action that can be applied to correspondence, we can take a simple lesson from life. When a dictator brings home to himself the realization that a personal representative, such as a salesman, must take proper leave of the person on whom he has called, he sees readily enough that his letter should end with some worthwhile utterance, and not be spoiled with some stale or ineffective phrase that can be called nothing better than "just words."

Little Error Bulletin No. 41

Error: "These meters are alright."
Correction: These meters are ALL RIGHT.

There is no such word as ALRIGHT. Usually the expression "all right" should be changed to "correct," or "accurate," or "proper." Ordinarily "all right" means very little, and it is used altogether too frequently.

BUT, when you do use this expression, be sure to write it correctly—ALL RIGHT.

Little Error Bulletin No. 53

Error: "He presented the case forcibly."
Correction: He presented the case FORCEFULLY.

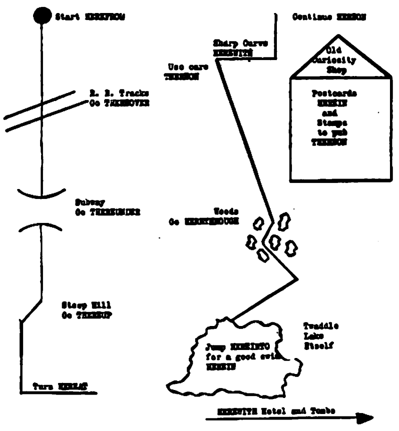
Although both words are based on the simple word FORCE, they differ materially in meaning. FORCIBLY usually implies physical action—force in a mechanical sense. FORCEFULLY means effectively or, for all practical purposes, convincingly.

The distinction between these two words should be noted. In nine cases out of ten, FORCEFULLY is the right word for the meaning intended. Many of us use its companion thoughtlessly and, therefore, erroneously.

Correspondence Bulletin No. 216

THE ROAD TO TWADDLEVILLE

This road map is for the guidance only of those whose fondness for the mummified twaddle of antiquity impels them always to hibernate mentally in the word tombs of the ages.



A Prime Factor in Customer Relations

The fundamentals that have been mentioned are the most important and most conspicuous of the highlights that correspondence study reveals. There are lesser points, too numerous to mention, that must be given prominence in the measures adopted by any advisory system. But whatever the method may be, it will give results that are worthwhile in any organization if it does nothing more than to create "group consciousness" that the business letter is a prime factor in customer relations and not merely an item of secondary importance in the daily grind of an industry's busy wheels.

EXTRA COPIES OF SERVICE SUGGESTIONS ARE AVAILABLE

To meet the growing demand for additional copies of Service Suggestions in loose leaf form the Customer Relations Committee has arranged to reproduce each issue. These may be ordered direct from the office of the chairman. The charge is five cents per copy.

An effort is being made to obtain a wider distribution of Service Suggestions so that the ideas and informaton which these monthly articles contain can reach the greatest number of individuals. The response to this effort and the letters from companies who have tried the plan proves the value of wider distribution.

Service Suggestion No. 70, "Employee and Consumer," contains specific information for employees of utility companies. Many companies have ordered copies for distribution to individual employees. Since the majority of employees are eager to improve themselves and their work specific information of this kind is very helpful in any campaign to improve service and build public good-will. Companies that have not taken advantage of this opportunity of procuring material for the information and guidance of employees have failed to take advantage of an excellent opportunity to improve the standing of their company in the minds of their customers.

H. T. East, *Chairman*, Customer Relations Committee,
1427 Edison Building, Chicago, Illinois.

INTERPRETATIONS of ELECTRICAL DEVELOPMENT

By Statistical Research Department, N.E.L.A.

H. A. SNOW, *Chairman, Statistics Committee, Accounting National Section*
H. S. BENNION, *Director of Engineering, N. E. L. A.*
WM. M. CARPENTER, *Research Statistician*
MERLE RAINEY, *Assistant Statistician*

The Statistical Research Department of the National Electric Light Association will issue monthly, in this section, basic statistical information on the electric light and power industry.

The Department regularly receives comprehensive annual and monthly reports from the larger member companies of the Association, whose total business represents 80 per cent of that of all electric light and power enterprises in the United States. In addition, the Department consults and cooperates with other sources of information.

Member companies are invited to make the fullest use of the statistical bulletins of this Department, published separately, as well as of the current statistical information in the N.E.L.A. BULLETIN, and to more fully utilize the services of the Department.

Current Statistics of the Electric Light and Power Industry

The data here presented are for the total (100 per cent) electric light and power industry and are based on monthly reports received from some 400 companies, representing over 80 per cent of the industry.

Basic Information on the Electric Light and Power Industry

As of February 28, 1929

The data included in this table are basic factors of the electric light and power industry and will be brought up-to-date at the end of each month and published in each issue of the BULLETIN.

1.	Value of plant and equipment (estimated)	$10,100,000,000*
2.	Total generating capacity in kw.	27,625,000
	Steam	19,796,000
	Waterpower	7,533,000
	Internal combustion	296,000
3.	Total number of customers served	23,582,000
	Farm customers	195,000*
	Domestic customers	19,137,000
	Commercial customers	4,223,000
4.	Population in electrically lighted homes (Electrical World)	81,500,000
5.	Percentage of homes which are served with electricity	66
6.	Miles of transmission lines (11,000 volts and above) (1927) (circuit miles)	132,000

---

*As reported by some 170 companies only.

The Cost of Living and Domestic Electricity

ALTHOUGH the cost of living today is two and a half times what it was in 1890, the price of household electricity is now but one-third of what it was at that time, according to the Statistical Research Department of the National Electric Light Association.

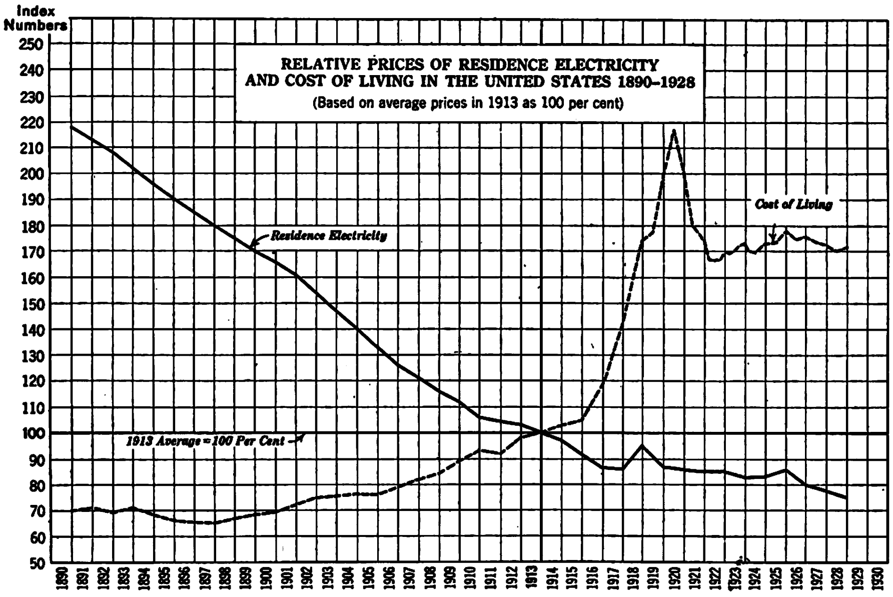
The average price of electricity for home use in the United States today is 25 per cent under pre-war prices, while the general cost of living remains at 70 per cent above pre-war costs. Each year since 1890 has seen a decrease in the average price of electric service in the home, with the exception of the years 1918 and 1925. In 1918, due to the shortened use forced by war-time lighting restrictions, the average price increased 10 per cent, which increase was wiped out in the two succeeding years. In 1925, there occurred a general rise in the cost of living, which was accompanied by a slight temporary increase of 1 per cent in the price of electricity.

The accompanying chart shows the relative trend of the residence electric rate and the cost of living since 1890; the year 1913 being taken as 100 per cent. The cost of living is that compiled and published by the United States Bureau of Labor. The average price of residence electricity between 1914 and 1925 is derived from statistics of companies in cities of 50,000 population and over, aggregating 60 per cent of the total urban population of the United States. Data for the years 1926 to 1928 are for the electric industry as a whole, as collected and published in the Statistical Bulletins of the National Electric Light Association.

In 1928, the average price for domestic electric current paid by the 19,000,000 householders of the nation was 6.6 cents per kilowatt-hour, according to the latest compilation of the Association. In 1913, the average cost was 8.7 cents per kilowatt-hour. The decrease of 2.1 cents per unit means a saving of at least $175,000,000 to the country's residence customers in 1928 under what their total charges would have been at the 1913 average rate.

Compared with 1919, frequently taken as exemplifying the first post-war year, the average price of electricity for home use now shows a decrease of 15 per cent. On the other hand, the average cost of living figure for 1928 showed a decrease of only 10 per cent below the average for 1919.

Roughly, electricity in the home is 1 per cent of the total family budget. This means that when the cost of living rises only 1 per cent, the amount of money represented thereby is approximately equivalent to the entire sum spent in the United States for residence electricity. The constant decreases in home electricity in this country well exemplify the principle of lowered cost with increased use and greater diffusion of service.



New Lighting Institute

(Continued from page 290)

special exhibit section devoted to transportation and aviation. The latter is equipped with a large model of the latest approved design of aviation field with landing lights automatically controlled by the sound of a miniature aeroplane flying overhead.

Across a passageway the visitor then discovers the office of the Director of the Institute, a model of up-to-date appointment and illumination; and next in line the conference room and general offices of the Lighting Institute. In one corner is located the work shop, fully equipped with wood working machinery, tools, and materials of all kinds for the repair and maintenance of the many exhibits. Also in this shop will be constructed the alterations to various exhibits from time to time as well as special exhibit pieces to be sent out for special showings in various parts of the country.

Ralph Neumuller has been appointed Managing Director of the Westinghouse Lighting Institute. As former merchandising and advertising manager of the United Electric Light and Power Company, he brings to the Lighting Institute a wealth of practical knowledge concerning the problems of the lighting industry and a wide acquaintance among central station executives and other electrical men throughout the country. He is assisted in his work by a staff of competent men and women who have spent years in engineering development and promotion activity of the Mazda lamp business.

ENGINEERING SECTION

Electrical Apparatus Committee Meeting

By T. G. LeClair

The Electrical Apparatus Committee met at Memphis, Tenn., March 13 and 14 with J. Allen Johnson, Chairman, presiding. There were three half day general sessions in addition to a half day devoted to subcommittee meetings and inspection trips. The following summary indicates the nature of the topics discussed:

Codes and Standards

The A. I. E. E. Standards Committee is proposing to undertake the formulation of Test Codes for electrical apparatus. The apparatus Committee, in general, feels that in order to make the present A. I. E. E. standards easily applicable, it would be desirable to have a test code which would indicate the manner in which prescribed tests shall be obtained. A standard method of testing similar to those used by the manufacturers would be very desirable.

Utilization

The Utilization Subcommittee with L. B. Bonnett as Chairman reported that results of a questionnaire have been received from various Geographic Divisions as to the desirability of changing the standard utilization voltage. The reports from these divisions indicate that the standard 110-volt utilization voltage is practically obsolete. Only 5 per cent of the companies reporting wished to retain the 110-volt standard and these were smaller companies. A proposal to drop the 110 volts as a standard system voltage at the end of one year was agreed to by a majority of those present and at a later meeting the question of whether or not to make 120 volts a co-equal standard with 115 volts is to be considered. The N. E. L. A.-N. E. M. A. Joint Committee on Preferred Voltage Ratings is asked to consider the correct rating for appliances to be used on the proposed standard system voltages. As a basis for this study, a recommendation was also made that a careful analysis be undertaken of the actual voltage at the utilization device.

Considerable progress is being made toward the increased use of approved motors with low starting current for household appliances. A number of washing machine manufacturers are now using the approved motors and many others are rapidly changing to the new type. L. L. Elden, who has been in charge of this subject, reports that manufacturers of the new "Exerciser" machines are very willing to use approved motors for these devices as soon as the trouble is pointed out to them.

Non-Resonating Transformer

F. W. Peek of the General Electric Company gave a brief discussion of the effect of lightning on transformers. He followed this by an illustrated description of a transformer designed to distribute over-voltages uniformly through the transformer coil. The design principle of this non-resonating transformer is a shield between central points on the winding and the high tension end of this winding. The capacitance of these shields corresponds with the capacitance between the same points and the transformer neutral. By means of their use, the distribution of the surge voltage is made the same as the distribution of the steady voltage and as a result the transformer insulation is uniformly overstressed.

Interconnections and Contracts

The Operating Practice Subcommittee (P. B. Juhnke, Chairman) presented a symposium on the operating aspects of interconnections and interchange energy contracts. An outline was presented covering load and frequency control, stability, protection, metering, communication, and coordination of interconnections. This outline is devoted primarily to the operating aspects and, as such, does not conflict with the work performed by the Fundamental Plan of Systems Subcommittee. A description was offered of the various types of contracts which are now in effect, together with some of the advantages and disadvantages of these contracts. Different contracts are required depending upon the type of interconnection, which may vary from the simple border line connection which is used for reserve supply to a substation or load center, ranging up to very closely connected networks and interconnections which are used for firm power. In reply to questions asked of many companies, the opinion was brought out that the demand clause should be left out of practically all contracts in order to simplify the operation of interconnections. Some of the most successful interconnections are operated without any contract whatsoever, and payments for energy interchanged are arranged on oral agreement from time to time.

A series of measurements were made on a 250-mile transmission loop to determine the phase shift with the loop opened at one point. Under some conditions, the phase difference across the open circuit breaker ran as high as 14 degrees. By closing the breaker after making measurements, the circulating current through this loop was found to be about 900 kw. per degree of phase displacement. Two methods of controlling this phase angle to prevent circulation of current in the loop are the use of 3-phase regulators or the use of tap changing transformers with the tap voltage 90 degrees out of phase with the line voltage. A third method suggested was the use of series capacitors in one or more lines of a loop which have an effect equivalent to changing the line impedance by balancing out the reactance. On another system with a 1400-mile loop, the phase shift across the open breaker was 50 degrees and the energy interchange with closed loop amounted to about 100 kw. per degree.

W. M. Dann of the Westinghouse Company gave an illustrated description of the principal features in the static transformer type of phase shifter. This type of phase shifter is practically the same as an ordinary tap changing transformer except that the primary connections are rearranged to insert voltage 90 degrees out of phase with the line voltage. The amount of compensation necessary to obtain a 20 degree shift on the line voltage is 36 per cent of the line voltage. None of these phase shifting devices has been put in service but they make a very satisfactory method of correction when it is not desirable to increase the transmission line capacity in certain parts of the loop to prevent overloading.

For systems covering a considerable territory, the indications are that for a reasonable degree of concentration in generating capacity, the addition of interconnected overhead lines does not add materially to the duty on circuit breakers. The line impedance for lines 10 miles or more in length at 33 Kv. or 50 miles or more in length at 110 Kv. is sufficient to cause no appreciable increase in the short circuit current due to what comes in over these lines.

Circuit Breakers

The Substations Subcommittee (L. G. Smith, Chairman) presented a symposium of statements by representatives of circuit breaker manufacturers on developments in ironclad switchgear and non-oil-throwing circuit breakers. One manufacturer is attempting to obtain the non-oil-throwing feature in circuit breakers partially by increasing the number of series breaks which should reduce the extent of decomposition in the oil by absorbing the heat of the arc in more and heavier electrodes. Two manufacturers have developed new lines of round tank, 3-pole circuit breakers for tank diameters from 16 to 32 inches. This new line is offered as a considerable improvement on circuit breakers of the lower interrupting capacities. For breakers of the higher interrupting capacities, the economy of the single tank is not apparent. One company is experimenting with breakers of the percussion type which interrupt the circuit by blowing oil or some inert gas through the arc stream. Further research is also being conducted on the vacuum type circuit breaker and the indications are that with a metal container to obtain the necessary mechanical strength there is possibility for commercial development on this type breaker. One railroad has applied 50 high speed oil circuit breakers which have an average time of operation from the application of the short circuit until the breaking of the arc, averaging about 0.6 cycles on a 25-cycle system. The manufacturer reported these breakers to be giving satisfactory service.

Many different types of metal-enclosed switchgears have been offered, including simply a metal housing around the circuit breaker and conducting parts, also, grease-filled, gum-filled, dry compound-filled, and oil-filled compartments. All of these types appear to promise satisfactory service for certain applications.

Two of the manufacturers have agreed to use their oils interchangeably in circuit breakers.

General

A number of inspection trips were made by members of the committee, including power plants, substations, and the A. C. network system.

The committee wishes to thank the Memphis Power & Light Company and the people of Memphis for their hospitality during the sessions.

Overhead Systems Committee Meeting

By HAROLD COLE, *Chairman*

THE Memphis meeting of the Overhead Systems Committee was held March 11 and 12 at the Peabody Hotel. While the number of members-at-large present was not as great as at some previous meetings, the number of visitors brought the attendance up to about one hundred at some of the sessions.

Reports of Committees

Two subcommittees presented serial reports at this meeting. These were the Steel Tower Transmission Lines Subcommitttee, L. O. Waite, Chairman, and the Construction and Maintenance Equipment and Methods Subcommittee, Philip Stewart, Chairman. These reports will be reviewed again by the Executive Committee of the Overhead Systems Committee and will then be submitted for publication.

Progress reports were made by the other subcommittees of which the following are of principal interest:

The matter of marking and lighting transmission lines and towers is progressing satisfactorily. Aviation authorities seem to be of the opinion that nearly all commercial flying will be at higher altitudes and the probabilities are that the illumination of overhead structures near airports will be the only thing which will be required.

The collecting of information on wind and ice loading is proceeding quite satisfactorily through the active cooperation of geographic committees and the weather bureau, and valuable data are being obtained.

The demand for up-to-date specifications for wood poles is such that the committee will endeavor to publish suggested specifications without waiting for the American Standards Committee Subcommittee which does not seem to be making any progress.

Wood Preservation

Mr. Charles Kerr, Field Engineer of the American Wood Preservers Association gave an illustrated talk on the preparation and manufacture of pine poles which is summarized as follows:

> The purpose of preserving timber is to prevent the destructive action of decay and insects, and thus prolong the useful life of a structure.
>
> The object of the timber treating industry is to give to the construction engineer a material that will effectively serve the purpose for which it is intended, at an economical cost, and we believe that this end will be best accomplished in those cases where pine poles are used, by a close adherence to the most general use of pressure treated timber, preserved in accordance with the standards of the American Wood Preservers Association.
>
> The action of germs of decay on timber is similar to the attack of insects. To exist, decay germs must have air, temperature, moisture and food. The elimination of any one of these necessities of existence will discourage the formation and growth of decay.
>
> Air, moisture and temperature may be regulated or excluded only with great difficulty, but the destroying of the food value of the timber is relatively an easy task, provided proper and proven preservatives are used. The proper application of an effective preservative to the timber will destroy this food value, and thereby prolong the life of the timber indefinitely.
>
> By proper application is meant the injection of the preservative into pine timber, under pressure. A dependable preservative must be possessed of at least four virtues to be effective. It must possess sufficient toxicity to discourage and prevent the *initial* attack of decay or insects; it must be available on the open market in large quantities; it must be inexpensive; and it must possess permanent qualities.
>
> The American Wood Preservers Association believes and recommends that pine poles and crossarms should be pressure treated full length with coal-tar cresote to give the maximum of protection at a minimum of cost, with a minimum retention of 8 pounds of preservative to the cubic foot of timber, dependent upon the service desired from the pole. All pine poles and crossarms should be framed to specifications before treatment, and framing after treatment should be avoided whenever possible. Should it be necessary to do framing in the field, all cuts in the wood should be protected by a free application of hot coal-tar creosote.

Numerous views of treating plant operating, pole line installation, and views of old creosoted timber structures were shown and explained.

Service Restoration

A group of papers on "Service Restoration" which had been prepared at the request of the Subcommittee on Operating Procedure, Mr. C. S. Van Antwerp, Chairman, was presented by the representatives of the various companies reporting.

These papers described the organization which had been set up to handle "trouble calls" in each case and the general procedure followed and brought out some interesting differences in procedure.

The companies reporting and the author of the papers were as follows:

The Philadelphia Electric Company—C. D. Buchholz.
The Edison Electric Illuminating Company of Boston—P. T. Butterworth.
Potomac Electric Power Company, Washington, D. C.—D. H. Lockwood.
Puget Sound Power and Light Co., Seattle, Wash.—M. T. Crawford.
Public Service Company of Northern Illinois —F. E. Andrews.
Commonwealth Edison Company, Chicago—K. E. Hobart.
Queens Borough Gas and Electric Co., Far Rockaway, N. Y.—H. Oberle.
Public Service Electric and Gas Co., Newark, N. J.—J. S. Ware.
Central Hudson Gas and Electric Company, Poughkeepsie, N. Y.—O. H. Bundy.

A report will be prepared by the Operating Procedure Subcommittee which will summarize the contents of these papers and similar information for other companies.

Railroad Wire Crossings

Mr. J. C. Martin, Chairman of the Railroad Crossing Subcommittee reported that his committee was now working with a committee of the American Railways Association in the preparation of principles and practices for the crossing of power wires and railroads. No definite progress could be reported but both parties had prepared proposed drafts which indicated that there was no serious disagreement. A meeting was scheduled for March 21 at which the committees of the two organizations would get together for the first time.

Objectionable Advertising

Mr. T. H. Haines called attention to a recent advertisement which appeared in the January number of the *Review of Reviews* and which was evidently paid for by the Union Metal Manufacturing Company. This advertisement appeared in the form of an article among the other articles in the magazine, the only thing that indicated that there was any difference being the word "advertisement" in small print at the bottom of each page. The advertisement appeared to be propaganda intended to influence public opinion and especially municipal authorities to force power companies to replace wood poles with steel poles. The text of the article contains some very misleading statements and gives false impressions which are still more misleading. The reader is led to believe that the average life of wood poles is about seven years. He also gets the impression that these poles have been used for general distribution purposes in many of the larger cities, whereas they have been used in these cities only for ornamental street lights supplied from underground circuits. The first part of the article is filled with eulogy of the power companies which is evidently intended to ease the mind of power company executives.

The opinion was strongly expressed by various committee members that this type of advertising was very objectionable and that member companies should take every occasion that might arise to manifest their disapproval of this kind of advertising.

Transmission Line Construction

Mr. E. A. Turner of the Appalachian Electric Power Company of Roanoke, Virginia, gave a very interesting talk, illustrated with 120 slides, on the building of a 180 mile, 132,000 volt transmission line through the Appalachian Mountains. The slides showed pictures of the territory through which the line was to be built, the line under construction, and finished portions of the line. This line traverses a very rough country and follows the mountain ridges. Spans are from peak to peak and are from 500 ft. to 4000 ft. in length. Steel towers are generally placed on mountain points many of which were so sharp that it was necessary to blow off the peak in order to get a flat space large enough to place a tower. The earth at most locations is rock. Forty tons of dynamite were used in the construction of this line. Most of the tower locations were nearly inaccessible. No roads were available and it was very difficult to get material to and from the job. When construction was started, tractors were used for conveying material. These were abandoned in favor of horses and mules with wagons. These were later abandoned in favor of oxen.

The oxen are more sure-footed and on the long hauls are actually faster than the horses and mules. In hauling some loads it was necessary to have forty yoke of oxen on one load for the following reason. The forty yoke are strung out over a length of about 600 ft.; a large number of the oxen would always have comparatively good footing; others would be going over rough, slippery places. Sometimes, six or seven yoke of oxen would fall down and would tend to slide down the hill. It would be necessary to have enough yoke of oxen to hold the slipping oxen and the load, thus it was forty yoke were required in many places. The conditions, difficulties and methods were so new and unusual to most of the members of the Overhead Systems Committee that no adequate idea of those could be conveyed except by pictures. The pictures were good and were very instructive.

Mr. L. E. Utley of the L. E. Meyers Company, Chicago, Illinois, gave a very interesting talk, illustrated with many slides, on the construction of a 132 kv. transmission line from Cincinnati to Indianapolis. This line is 85 miles long and 25 miles of it runs through very bad country. Most of the material was transported by tractors. Digging was done with digging machines and refilling with machinery. Considerable erection was done by machinery. Horses were used in the hills. Caterpillar tractors were generally used, since it was possible to get to most locations with this kind of a machine.

Most of the ideas were conveyed by means of pictures which Mr. Utley described and which showed very clearly difficulties experienced in building this line.

Mr. A. E. Davison of the Hydro Electric Power Commission of Ontario gave the Committee an idea of the problems encountered in the construction of a 220 kv. line in eastern Ontario by means of motion pictures. Mr. C. F. Benham of the Great Western Power Company also described a type of transmission tower developed by his company for single circuit 220 kv. construction which is particularly applicable where a great deal of side hill construction is necessary.

The Effect of Lightning on Transmission Lines

Mr. F. W. Peek, Jr., of the General Electric Company, gave the Committee and a number of visitors from other committees a very instructive talk in which he described the latest results of the extensive research being carried on by his company in the matter of the effect of lightning on various parts of a transmission system and methods of protection against breakdowns of equipment. During the past year considerable progress has been made in the study of lightning, due to the use of the cathode ray oscillograph and the development of a means of connecting it to a line at the time the lightning surge occurs. Actual photographs of surges have been obtained and the wave shape determined and apparatus set up to reproduce the surges in the laboratory and on actual lines to further study the effects. One of the results of the studies of the effects of surges has been the development of the non-resonating transformer which is designed to keep surge voltages from building up in transformer windings.

Mr. Peek showed a number of slides to illustrate his talk and among these were many interesting oscillograms. Inasmuch as papers are available which cover the subject of Mr. Peek's talk no attempt will be made to summarize it here. A pamphlet has been published by the General Electric Co. entitled "Lightning—Progress in Lightning Research in the Field and in the Laboratory" which is obtainable upon request.

Prime Movers Committee Meeting

By Edwin B. Ricketts, *Chairman*

The Prime Movers Committee joined the other committees of the Engineering National Section in a group meeting in Memphis, Tenn., on March 11 and 12, with an attendance of thirty-nine members and six guests.

This was the final meeting of the year and therefore the appointed time to receive final reports from the major subcommittees.

Higher Steam Pressures and Temperatures

A very complete report was submitted by Mr. McDonald on the subject of Higher Steam Pressures and Temperatures, in which rather complete and detailed statements are contained from ten plants operating with pressures in excess of 450 lb. Six of these plants are, or will shortly be, operating at 1200 to 1400 lb. and four with pressures between 600 and 700 lb. These statements contain data on operating troubles and very frankly set forth experiences with these relatively new pressures and temperatures.

Statements covering recent research in steam conditions and characteristics for these higher pressures and also for stresses under high temperatures are contained in this report.

Caustic Embrittlement

The subject of caustic embrittlement and its prevention at high pressures and temperatures is covered in a report by Professor Straub, containing the most recent information on experimental determination of safe operating conditions.

Pulverized Fuel

The Pulverized Fuel subcommittee reported an increase in the use of unit type of pulverized fuel installations for both industrial and public utility plants. Its report also covers the question of collectors for dust from mill and cyclone vents. One operating company is using a bag filter with very satisfactory results.

There seems to be a tendency to use horizontal turbulent type of burners and to arrange the furnaces for removal of ash in molten form in the so-called slag tap type of furnace.

Operating troubles with slag on the boiler tubes and mill maintenance costs, etc., are covered in considerable detail in the report.

Stokers

The Stoker Subcommittee report outlines a new development in the Taylor stoker wherein a new method of driving the rams has been devised to decrease the wear and maintenance costs. Likewise, the new Westinghouse stoker containing a considerable overfeed section following the underfeed retorts, is described both by the manufacturer and by the Brooklyn Edison Company which has such a stoker installed in its new addition to Hudson Avenue Plant.

The ever-present discussion between various types of furnace water cooled walls is covered by statements from manufacturers and operating companies, although no quantitative data are available to prove the superiority of one over the other.

Turbines

The Turbine Subcommittee has again collected data covering the operating records of turbines over 20,000 kw. and this year's report will bring these records up to date and show a very complete history of experience with these large machines. It is interesting to note that the first year's operation of new machines shows no better results than for machines of three or four years ago.

The report will show the experience record of 153 machines installed in 1926, 186 machines installed in 1927 and 200 machines installed in 1928. The service demand factor on turbines was slightly better in 1928 than 1925—72 and 68 per cent respectively. Likewise the availability per cent was 96 in 1928 and 94.6 per cent in 1925.

The results of numerous tests on turbines is included in this year's report, showing both the water rate and the B.t.u. consumption.

Automatic Frequency Regulators

Several companies reported on the use of automatic frequency regulators, most of them so far reporting that the regulator produced a remarkably constant frequency but at the expense of irregular load on the turbine and undesirable fluctuations in the steam pressure and bleeding conditions. The Commonwealth Edison Company reported a modification of the Warren system in which these difficulties had been eliminated and very satisfactory results are being obtained.

Boilers, Superheaters and Economizers

The Boilers, Superheaters and Economizers Subcommittee submitted a very complete report covering the development of steam generating equipment with particular reference to high pressures and temperatures which is the trend in design at the present time. The report calls attention to the relatively large benefit that would result by the increase of superheated steam temperatures from the customarily accepted limit of 750 deg. to 900 or 1000 deg., if and when such is feasible, by the use of metals capable of withstanding the required stresses at these high temperatures. The report also contains a statement from an oil refining company on the operation of high pressure cracking stills in which pressures and temperatures considerably above boiler room practice are in common use.

Oil Engines

The Oil Engine Subcommittee submitted operating cost data for the year 1928 and were instructed to combine this data into a yearly basis and submit it to the Editing Committee for publication.

Round Table Discussion

Under the heading of "Round Table Discussion," Mr. Baltzly described a washing machine for continuous use on a turbine, in which a certain amount of lubricating oil is by-passed continuously, mixed with water at 160 to 180 deg. fahr., and passed through a Delaval separator and thence back into the system. The use of this machine has made it unnecessary to clean the oil pipes or the oil cooler for over two years and thereby has materially reduced the maintenance cost and trouble usually encountered from the accumulation of sludge and dirt in the oil passages.

Professor Christie told the Committee of the practice in Europe of comparing station performance from period to period by plotting a total station B.t.u. versus total kwh. output. This results in a Willans line and is used in England and on the Continent for control purposes. He had plotted some data from one American station on this basis and found somewhat inconsistent results because of changed conditions due to improved design with each additional unit of construction. He asked for data from other stations in order that he might plot this data and compare it with practice in Europe.

The Committee learned with deep regret of the death on March 2 of John Wolff who had long been a member of the Prime Movers Committee. The Committee, through its Secretary, expressed its sympathy to Mr. Wolff's relatives and to his Company officials.

The next meeting of the Committee is scheduled for October, 1929, at time and place to be announced.

Underground Systems Committee Activities

By J. W. SYLVESTER, *Chairman*

THE Mid-Winter meeting of the Underground Systems Committee, Engineering National Section, N. E. L. A., was held at Pittsburgh on Jan. 24 and 25, 1929, while the Spring Meeting of the Committee,, as a part of the Engineering National Section Group Meeting, was held at Memphis on March 13 and 14, 1929. Both of these meetings were exceedingly well attended.

The programs which had been prepared in advance were closely adhered to. Many Sub-committee reports were distributed to members requesting advance copies. This practice has resulted in quite lively discussion which would probably not have been possible otherwise. The following Sub-committee reports were presented:

Cable Installation

A. F. Randolph, Chairman, rendered a progress report dealing with the installation of long cable sections, aerial cable, buried cable, the protecting of cable risers, an outline of an economic underground distribution system and an insulated pothead support. The economic feature of the secondary distribution system described was accomplished by the use of rubber insulated, unleaded cable on open wiring in the manholes with the same type of secondary service cables, both single and multiple conductor. Successful installations of cable sections approximating 1000 feet in length were described.

A. C. Networks

H. S. Davis, Chairman, reported a compilation of answers to a questionnaire covering the operating practices and experiences of the companies which have installed A. C. networks within the past few years. From the operating experiences of the companies replying to the questionnaire, little difficulty has been experienced in burning off faults on secondary systems where the mains were tied in solidly.

Cable Joint Design and Construction

R. G. Hooke, Chairman, and C. W. Franklin presented a report, in which was given among other points, trends of development pertaining to high voltage joints, as follows:

1. A decided preference for varnished cambric tape.
2. Plastic compounds above 20,000 volts.
3. Electrostatic shielding.
4. Stepping of insulation instead of pencilling.

A. E. I. C. and N. E. L. A. Joint Sub-Committee on Analyses of Cable Failures

F. M. Farmer, Chairman, and H. S. Davis recommended a simplified form of report for the N. E. L. A. use which was adopted. We are leaving the more definite detailed data to be secured through A. E. I. C. channels from the fourteen largest operating companies.

Impregnated Paper Insulated Cable Research

D. W. Roper's report was presented by Herman Halperin. It gave an outline of the researches which are being sponsored by the Sub-committee, as well as those which are being conducted by the members companies, by the manufacturers and by the Electrical Testing Laboratories. The report showed that there was still a great deal to be learned regarding the effects of entrained moisture, occluded air, nature of compound, use of special gases as inhibitives to ionization, evacuating and impregnating processes nature of paper, etc. The report closed with a statement of the experimental studies which have been carried on by the Electrical Testing Laboratories on the effect of end conditions; the treatment of samples on the results of dielectric loss tests; the stability of compounds and many other factors entering into cable design and operation.

Inspection and Testing of Cables

The annual report of this Sub-committee was presented by Mr. Randolph. It indicated in general a continued trend in the direction of improvement with decrease percentages to deficiency and insulation resistance, power factor and ionization factor distinctly improving. The relation of these topics to researching progress is also discussed.

Conference of Company Code Representatives in Chicago

THE discussions which arose in connection with the grounding rules of the National Electrical Code during the past year aroused among member companies more interest in code questions than had existed for many years before. This discussion also had the effect of impressing the entire membership with the actual interest which power supply companies have in all of the electrical codes. There has always been a relatively small group of central station executives and engineers who have appreciated the importance of the codes, and who have participated actively in their development, but in spite of the very large amount of devoted voluntary work contributed by these men, it has still remained extremely desirable to procure the general participation of all member companies, since correct estimates of varying local conditions are essential for the formulation of sound policies in connection with code developments.

The developments of the past year have shown in a striking manner the extent to which code development has depended upon opinion and estimate; it has been plainly shown that important groups of rules have been developed in this way. It is possible that the situations to be dealt with were originally urgent enough to compel this process; but unfortunately little has been done since to re-examine the earlier premises with the result that many rules, having important economic effects, rest upon slender foundations of recorded fact.

These two considerations led the National Electric Light Association during the winter of 1928-1929 to enlist the services of a corp of company code representatives. These company code representatives directly represent member companies in codes and standards activities, primarily for the purpose of reporting the needs of the companies in this field, but also for the hardly less important function of collecting and reporting data upon matters affecting code rules. For administrative purposes they are considered to be agents of the Codes and Standards Committee.

Consideration of the elaborate committee structure of the Association might lead one at first to regard the formation of this body of company code representatives as an unnecessary duplication, but this is not so for the following reasons: The committees of the Association have adequate jurisdiction and are capable of formulating policies in the codes and standards field, and they are also well adapted for the deliberate consideration of the technical and commercial questions involved. Committees, however, are necessarily limited in membership to representative men in their particular specialties and their coverage is, therefore, not adequate for a rapid reflection of opinion throughout the membership. Moreover, the ordinary mode of committee procedure is generally unsuitable for the prompt collection of data in a form that fully reflects local variations and peculiarities. Both of these factors, especially the element of time in each, are essential for the administration of code activities.

The company code representatives do not constitute a committee. It is highly improbable that they will ever be brought together for the purpose of stating the Association opinion upon technical, commercial, or administrative matters, within their field, principally for the reason that there are existing committees quite competent for this purpose. The individual opinions of company code representatives, or rather the opinions which they will express on behalf of their companies, will be frequently sought, and normally the collection of information so procured will be submitted to the appropriate committees of the Association for a deliberate conclusion and statement of Association policy. In a similar manner, the large amounts of data and statistical information supplied by company code representatives will be arranged in workable form and submitted to the appropriate committees of the Association for consideration.

The outstanding fact revealed by the year's activities has been the lack of reliable information on questions which determine the need for various code requirements. This, therefore, is the first duty that company code representatives are called upon to perform; indeed, they have already contributed extensively in this respect. On account of recent activities in the field of the National Electrical Code, special attention is being devoted at this time to questions related to the low voltage electrical hazard, in order that a correct estimate may be made of the prevalence and the characteristics of this hazard. This is not the only function of these representatives, however; they are also expected to compile reliable experience records upon various other hazards dealt with in the electrical codes, and it is hoped that within a comparatively short time the Association will be in a position to state the results of field experience for various classes of hazards with considerable precision.

A conference of these newly appointed company code representatives was called in Chicago on March 18 and 19, 1929. The purpose of the conference was to discuss with them the needs of the Association in the code field, and to instruct them in their duties. The conference was very well attended, seventy men from all parts of the country were present. The first session of the conference was devoted to addresses by prominent authorities in this field. Mr. E. W. Lloyd, vice-president of the Commonwealth Edison Company, presided, and addresses were delivered by Judge O. B. Ryon, General Counsel of the National Board of Fire Underwriters, M. E. Sampsell and E. C. Stone, chairmen respectively of the Commercial and Engineering National Sections, Irvin W. Day, chairman of the Codes and Standards Committee, and Alva R. Small, vice-president of the Underwriters' Laboratories and chairman of the Electrical Committee NFPA. It is planned to publish these addresses in subsequent numbers of the BULLETIN.

The remaining sessions consisted of general discussion of the services which company code representatives are asked to render, the service which they may expect from the Association, and the best means for doing these things. The conference also discussed the various electrical codes, their characteristics and trends of development, desirable changes in their form and substance, and other matters intended to give the representatives a general view of the situation and of their relation to it.

The interest displayed by the members of the conference was extremely satisfactory and it explained as well what has for years been taken as a lack of interest in code matters. It was apparent that there is a healthy and intelligent interest in code questions among member companies and that the difficulty of apparent indifference has been due mainly to the absence of definite channels for giving and receiving information and for guiding isolated activities in a way to procure coordinated action. This is what the company code representatives are expected to accomplish.

Great Lakes Engineers Meeting

ABOUT two hundred engineers gathered in Chicago, April 18 to 20, for the first 1929 meeting of the Engineering Section, Great Lakes Division, N. E. L. A.

All of the sessions were well attended, but those of the overhead systems and underground systems committees appeared to be most popular. A notable contribution to the work of the former committee was the report on reliability of transmission lines of more than 100 kv. This report tabulated line outages according to their significant classifications and should be a valuable index of performance in determinations of design. Another matter that excited much interest and discussion was a comparison between manual and machine costs in pole-line erection.

The underground systems committee was mostly occupied with problems of duct-line and manhole construction and with means to assure perfection in making cable joints. The experience of the Detroit Edison Company with shielded cable and its solution of the distribution of electrostatic stresses in joints on this cable excited interest. An excellent series of still and motion pictures of labor-saving and cost-cutting machinery used in its underground construction was presented by the Commonwealth Edison Company.

Meter schools and other educative activities were live topics with the meter committee, as was also that perennial subject of discussion—outdoor meters. The electrical apparatus committee considered the progress so far made on the assembly of a map showing transmission lines in the Great Lakes region, the purpose being to provide an easy source of reference when interconnections between systems are in consideration. The hydraulic power committee discussed the project, originating in the national body, for the appropriation of a sum of money for the development of test methods on hydro-plant performances. A large part of the time of all committees was devoted to acquainting the local members with the work of the National Committee.

Investigation of Faults on Power Lines as They Affect Telephone Lines

ONE of the most noticeable developments in the central station industry during the past decade has been the concentration of large blocks of power at the generating station and load centers and the inter-connection of these centers by high voltage transmission lines. With the increasing importance of these arteries of power and the increasing importance of the reliability of service, attention has been directed toward schemes of relay protection which would limit the amount and extent of the system disturbance at times of insulation failure. This has led to studies of system stability, methods of relaying and methods of calculating the magnitude of fault current. The same developments in the industry which have brought these operating problems have brought closely related problems in the field of inductive coordination.

Inductive coordination of power lines with telephone lines includes two broad classifications: The first of these is the noise resulting from induced voltages within the voice frequency range which may exist under normal operating conditions and is frequently referred to as voice frequency or "normal" induction. The second of these is the voltage at fundamental frequency induced on the telephone lines at time of ground faults or other unbalances to ground on the parallel power system which may be of such magnitudes as to cause serious disturbances to the telephone plant. This latter type of induction is spoken of as low frequency or "abnormal" to distinguish it from that which produces noise under normal operating conditions.

An article in the February issue of the N. E. L. A. BULLETIN told of the work that Project Number 2* is doing to solve the problem of limiting the effects of voltages that may be induced in telephone circuits from paralleling power circuits. Project Number 3* has been working on another phase of this problem. Its efforts are being directed in part at finding means for limiting the voltages that might be induced from a given parallel and at limiting the currents in the power system under ground fault conditions. So far in its work it has obtained information on the following points:

(1) Method of calculating fault current on a power system at time of single-phase-to-ground failure. This includes both formula to be used in such calculations and knowledge of the range of constant to be used with them.

(2) Division of fault current between earth and other paths, including effects of ground wires and shield wires.

(3) Methods of limiting fault current. The effectiveness of these measures and the limits in their use imposed by operating conditions on the power system.

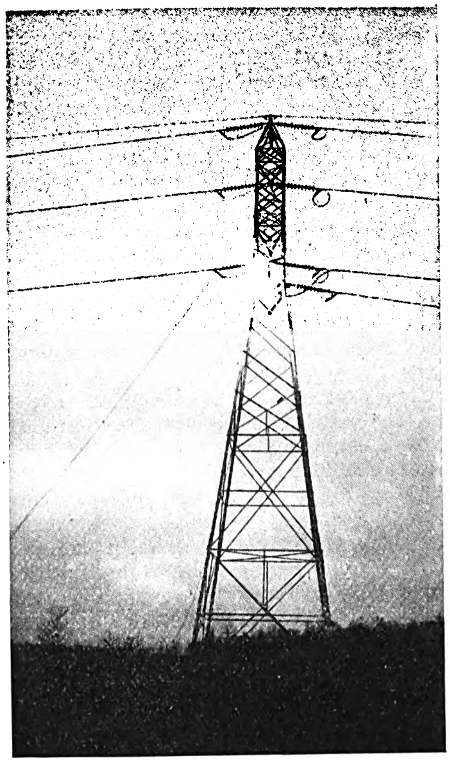
(4) Effects of shield wires on telephone lines and effects of cable sheath grounding.

This committee conducted a series of tests in Dayton, Ohio, and working with Project Committee Number 2 secured some valuable information at Athenia, New Jersey. In addition it has entered into several other cooperative studies.

The tests in Dayton were conducted on the 33 kv. system of the Dayton Power and Light Company. They consisted of oscillograph measurements of currents and voltages when single-phase-to-ground faults were applied to the lines. The tests were made under system operating conditions. The data which was secured may be listed under the following headings:

(1) Information which serves as an excellent check on the method of calculating the single-phase-to-ground short circuits by the symmetrical component method developed by C. L. Fortescue and others. This theory was further enlarged to include the effect of loads and line capacitance. The significance of these further refinements on the accuracy of calculations has been considered.

(2) The use of a resistance in the neutral of power transformers at the generating station was studied to determine the effect of changing the value of resistance on: the magnitude of single-phase-to-ground fault current; the distortion of the voltage triangle at time of single-phase-to-ground fault; the power available for relaying; and the voltage surges resulting from switching operation and arcs across insulators.



An intentional arc across an insulator. Part of a study on 132 Kv. line.

One of the interesting facts brought out by these tests was that a transmission circuit operating as a closed loop may have sufficient uniphase current induced into it from a single-phase-to-ground fault on a paralleling feeder to operate its ground current relays. This phenomenon may account for cases of faulty operation where sound lines have been tripped out by residual relays at the time of a single-phase-to-ground fault on a paralleling feeder. It should be pointed out that this same condition may occur on a line protected by ground current relays where the transformer connections at both ends are grounded wye-delta. The reason for this is that a low impedance path to ground is provided at each end of the line for currents which are in phase on each of the three phase wires by virtue of the closed delta winding. A line so equipped with transformers is equivalent to the closed-loop circuit on which tests were made.

The Athenia tests were on a 26-kv., 3-conductor underground cable, of the Public Service Electric and Gas Company of New Jersey. Among the items of general interest which were derived from this test are:

(1) Ground potential of a substation under fault condition when the earth connection consisted of a large inter-connected grid of buried copper wire.

(2) Coefficients of induction between an underground power cable and telephone cable which was partly aerial and partly underground.

(3) Current division between sheath and earth of the fault current of a power cable and the zero-phase sequence impedance of the cable.

A review of the progress of Project Number 3 shows that the data secured through its work should be of considerable value to operating engineers in studying their relay problems, aside from its value in inductive coordination work.

Meeting of French Electrical Association to Be Held in July

Notice has been received that a national meeting of the French Syndicat Professionnel des Producteurs et Distributeurs d'Energie Electrique will be held July 1 to 3 inclusive at Nantes (Loire-Inferieure), and American engineers are invited to take part in the meeting which will comprise an extensive list of subjects. Members of the Association who expect to be abroad at that time and who desire to participate in this meeting may have arrangements made by application to the Engineering Department, N.E.L.A. Headquarters Office, 420 Lexington Ave., New York, N. Y.

---

*Of the Joint Subcommittee on Development and Research of Bell Telephone System and N.E.L.A.

Northwest Engineering Meeting

THE annual group meeting of the Engineering Section, Northwest Electric Light and Power Association was held at Walla Walla, Wash., March 25-27 with an attendance of 140.

President R. M. Boykin of the Northwest Association suggested the formation of a permanent power committee consisting of all committee chairmen to study problems which affect the Northwest as a whole, such as power needs, interconnection and economies and the interrupting capacity of oil circuit breakers. He further urged that utilities make a special effort to give employment to engineering graduates, but called the attention of educators to the shortcomings of many engineering graduates in speaking and writing English.

Several papers on alternating-current underground systems were presented. One by F. L. Rohrback described the ring-feeder system being installed in Spokane; another, by F. E. Fisher, took up the use of translators for partially converting the delta alternating-current underground distribution system in Seattle into a grid system, and a third, by H. Richter, Westinghouse Electric & Manufacturing Company, dealt with the broader engineering features of alternating-current underground distribution, including the use of network protectors and other recently developed apparatus.

Engineering of rural electrification was the subject of a paper presented by R. E. Gale for the overhead systems committee. Careful studies made by the Idaho Power Company have led that company to adopt as standard construction for rural lines 7-in., 35-ft. poles, 250-ft. spans, No. 6 hard-drawn wire and a voltage of 6,900/11,000. Such lines will serve a territory where there is an average of five customers per mile and a load of 15 kw. per square mile. The average cost per mile is $1,015.

Application of some of the more important requirements of the National Electrical Safety Code affecting overhead lines were presented in graphical form by R. J. Davidson. Dan L. Lindsley summed up the advantages of creosoted Douglas fir poles as strength, long life, non-conductivity and being fire-resistant and termite-proof. Major H. S. Bennion, director of engineering, N. E. L. A., explained the code situation. Discussion of a paper by A. L. Harding on preferred voltage standards for alternating-current systems showed clearly that operating men favor standardization, but that on many systems this involves many difficulties and great expense. Much interesting and valuable information was given in two papers on recent apparatus developments, one by C. E. Carey (Westinghouse), the other by C. W. Fick (General Electric).

The second afternoon of the meeting was given over to the accident-prevention and meter committees, each of which presented three papers of value to those interested in these fields.

That the fish problem in connection with hydro-electric developments is still a live issue in the Northwest was shown in a paper on this subject by J. E. Yates. He said that experiments with an electric fish screen have shown its practicability as a means of keeping small fish out of irrigation ditches and told of experiments under way to determine its value in diverting salmon into traps, hoists and fish ladders at the Gold Ray dam in southern Oregon, since if fish can be diverted into such devices there is no difficulty in getting them over high dams. Turbine leakage and problems of hydro-unit governing were the subjects of two other papers presented by the hydraulic power committee.

A paper on predrying of hog fuel (sawmill refuse), by W. A. Struthers, dealt with experiments on drying with flue gases hog fuel containing 46 per cent moisture. The tests indicated that from a heat-balance standpoint there was no economy over utilizing the heat in some other manner. However, the subject was said to be worth further investigation.

Two fine papers were presented by the inductive coordination committee—one, by Ellis Van Atta, dealing with radio interference caused by pin-type insulators; the other, by E. L. White, on interference caused by suspension insulators. Each paper presented a distinct contribution to the knowledge of the underlying causes of radio interference along transmission lines, outlined remedial methods and told of efforts being put forth by insulator manufacturers to aid in the solution of the problem. In order to expedite solution of the problem it is planned to build a 3000-ft. experimental line at Oregon Agricultural College and conduct a comprehensive and exhaustive series of tests with all types of insulators and at the various standard transmission voltages.

International Conference on Large Electric High-Tension Systems

THE International High-Tension Conference which was founded in 1921, under the auspices of the International Electrotechnical Commission, and which is, apart from the latter, one of the oldest and most important international bodies dealing with electrotechnical matters, will hold its fifth session in Paris, from the 6th to 15th of June next.

Former conferences took place in 1921, 1923, 1925 and 1927. At the last session, 544 members coming from 28 countries took part, this shows the exceptional and world-wide interest which is taken in the proceedings of the Conference.

The proceedings will take place in two languages, *English* and *French*, and an interpreter will be present at each meeting to give every assistance required; the organizers of the conference have been congratulated on the way in which the individual meetings for the convenience of those who attend, have been carried out in the past and the arrangements made.

The proceedings of the Conference and the papers to be presented are of such a character as will unite in general common interest producers and distributors of electricity connected with private State or municipal enterprises, Consulting Engineers and professors, makers of electrical plants and accessories and contractors responsible for the construction of electrical power stations, power lines, and interconnecting networks.

Up to the time of the preparation of this notice, 380 members from 21 countries, have already been enrolled for the June Conference, and it is anticipated that the members of the 1927 session will be exceeded. Ninety-eight papers have been sent in from 18 different countries; of these, 33 deal with the construction of material, a feature being those papers connected with generators, transformers and transformer oil 33 on the construction and insulation of lines, including electrical and mechanical features relating to switchgear, cables, bare conductors, insulators, overhead line supports of steel, concrete and wood, and problems relating to their maintenance; and 32 papers on the layout, calculation, operation and protection of lines and networks, including problems connected with lightning effects surges, protective relays, grounding of neutrals, snow loading, load despatching, measurement, and inter-station communications.

The fee for the Conference is 250 fr.

The date chosen for the Conference, June 6-15, is at the most pleasant time of the year for a stay in Paris, and in order to assist those members who come from abroad, the secretariat of the Conference will give every possible assistance in the direction of arranging in advance, for those who so desire, for accommodation in Paris to suit all pockets.

The permanent offices of the High Tension Conferences are situated at 25 Boulevard Malesherbes, Paris (close to the Madeleine). Those requiring information should write to the Organizing Secretary, M. Tribott Laspière at the above address.

Residents in the United States who wish to take part in the Conference, are requested to communicate with Mr. Mailloux, 111 Fifth Avenue, New York, in order that American engineers can be brought together regarding various matters relating to the Conference activities.

GEOGRAPHIC DIVISIONS and STATE ASSOCIATIONS

Arizona Association Meeting

THE Arizona Utilities Association met jointly with the Pacific Coast Electrical Association and the Pacific Coast Gas Association on April 4, 5 and 6, at the new El Conquistador Hotel, Tucson, Ariz.

M. A. Pooler of Tucson, retiring president of the association, in opening the convention, outlined the growth of Arizona and the progress and development of the utilities within the state, with particular emphasis on the Tucson Gas, Electric Light & Power Company, of which he is president. The principal address of the opening day was made by Paul M. Downing of San Francisco, president of the Pacific Coast Electrical Association, who declared that the utilities need fear nothing from investigations and implications of wrongdoing if they will inform the public of their work and accomplishments in a fair and impartial manner.

Important papers included one by E. B. Chase, National Lamp Works, San Francisco, on "Light, the Business Getter," illustrated with explanatory charts. A. E. Higgins, American Gas Association, outlined ways in which to educate the public in the choice of lighting equipment. George Lewis of Denver, representing the Rocky Mountain Committee on Public Utility Information, gave an interesting address, using as his subject, "Still Again, Why All the Secrecy?" He appealed to those present, when they returned to their respective companies, to pass on to others some of the things they had heard and learned by attendance at the convention.

On the second day excellent papers were read by company employees as follows, first, second and third prizes being awarded respectively to the three named: "Employees and Customers' Relations," by Wilma D. Jones and Irene Wolcott of Bisbee, representing the Arizona Edison Company; "Better Public Relations Through Association Work," by Claud H. Weber, Tucson Gas, Electric Light & Power Company; "Telling the Story," by Jack Arnold of the Central Arizona Light and Power Company, Phoenix. "Feminism in the Public Utility Field" was dealt with by Mrs. Ruth E. Creveling, San Diego, chairman women's committee, Public Relations Section, Pacific Coast Electrical Association.

Election of officers for the following year and reports of committees, as well as the annual report of Lee C. McCullough, secretary and treasurer of the association, occupied the last morning. This business session was followed by a trip to the famous cattle ranch on the Mexican border, 60 miles south of Tucson, known as the Hacienda de la Arivaca, where a specially prepared entertainment and a barbecue were given.

New officers are: President, L. V. Seares, Arizona Power Company, Prescott; first vice-president, A. F. Moriarity, Central Arizona Light & Power Company, Phoenix; second vice-president, Milton G. Sanders, Arizona Edison Company, Phoenix; secretary-treasurer (re-elected), Lee C. McCullough, secretary Arizona Industrial Congress, Phoenix.

Maryland Association Convention

THE seventh annual convention of the Maryland Utilities Association was held in Baltimore on April 12. F. F. Hennaman of the Penn Central Light & Power Company and H. S. Metcalfe of the West Penn Power Company discussed the general basis and policies involved in public relations, while R. F. Bonsall, C. H. Leatham and G. P. Mangan offered practical observations for achieving the desired results through the activities of the operating personnel. The electric, transportation, gas and water groups met separately in the morning and jointly in the afternoon.

Paul Wooton, Washington correspondent of the *Electrical World*, outlined general business conditions and the probable trend of Federal Reserve Board activities, copper price and industry developments, influence of electrical energy upon economic conditions in the coal-mining industry and related topics at the afternoon session. A. C. Roy of the Edison Lamp Works presented an inspirational sales talk on "Retail Merchandising" and pointed out some often-overlooked possibilities. "The Place of the Public Utility Under Modern Business Conditions" was noted by M. B. Lambert of the Westinghouse Electric & Manufacturing Company, with particular reference to the railway field. "Televox," the mechanical man, was demonstrated.

At the closing session following the banquet, at which Governor Albert C. Ritchie was among the guests, the Governor advocated better and more intimate relations between the utility and those served, pointing out the need for the education of the public.

President H. T. Connolly presided. The officers elected for the coming year are: President, H. A. Brooks, Potomac Electric Power Company; vice-president, R. E. Towne, Potomac Edison Company; treasurer, Frank E. Mitchell, Eastern Shore Gas & Electric Company; secretary, David Kennear, United Railways & Electric Company. L. G. Smith, Consolidated Gas, Electric Light & Power Company, is chairman of the electric group. Nearly three hundred members and guests registered for the business sessions and many more attended the banquet.

New England Division Elects Officers

CHARLES H. HODSKINSON of the Boston Edison Company was elected president of the New England Division of the N.E.L.A. at the annual meeting in Boston last week, to take office July 1. Other officers chosen were: Vice-presidents, H. E. Duren, Greenfield, Mass., and W. C. Bell, New England Power Association, Boston; treasurer, Frank L. Ball, Charles H. Tenney & Company, Boston. The next convention will be at the Hotel Griswold, New London, Conn., Sept. 9-12.

Effects of Indeterminate Franchise Principles in Oklahoma

IN his report to the 11th annual convention of the Oklahoma Utilities Association held at Oklahoma City, March 12-14, Edward F. McKay, Manager of the Association, gave the results which have followed the adoption of the indeterminate franchise principle in Oklahoma in 1925.

Mr. McKay reports that "Nearly 100 cities and towns of the State have secured electric service, and approximately the same number gas service, which had no such service prior to the meeting of the 1925 Legislature, and the passage of the revocable permit bill. Many more cities and towns previously having only part-time electric service have secured 24-hour service under operation of this law. Electric transmission line mileage in Oklahoma has increased more than 150 per cent with this law in operation and gas pipeline mileage exceeding 4-inch in size has increased more than 1500 miles. Forty million dollars of new capital has been attracted to Oklahoma, new financing being facilitated by the fact that no longer does expiration of their right to operate in certain towns before maturity of the securities offered confront companies seeking to raise funds for expansion.

"Ability to take service to the small towns and villages makes it possible to serve the farmer and the rural industry. High transmission line voltage cannot be stepped down for individual customers. Hundreds of rural industries are springing up in all sections of the State where power lines are hooking up the villages and hamlets, while service to the farmer, rapidly becoming general, is the only real 'farm relief' yet accomplished by any means, and is transforming farm life and stabilizing the distribution of population throughout the State.

"As to the effect on rates: Rate reductions for electricity have been so numerous that their exact number is uncertain, but they have affected advan-

The sublime and the ridiculous are often so nearly related that it is difficult to class them separately. One step above the sublime makes the ridiculous and one step above the ridiculous makes the sublime again.—Thomas Paine.

tageously practically the entire electricity consuming public of the State. There has been no advance of any electric rate charged by a private company since this law became effective. There have been numerous gas rate reductions as well, and estimates of the financial saving to the public through rate reductions, electric and gas, disregarding increased consumption through decreased rates, indicate a total saving of substantially more than four million dollars. Practically seven-eighths of the amount is on the electric side of the account.

"Investigation and analysis of results must lead inevitably to the conclusion that every claim made for this measure by its proponents in 1925 has been more than justified by results that have followed its adoption."

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912

Of N. E. L. A. Bulletin, published monthly, at New York, N. Y., for April 1, 1929.

State of New York,
County of New York.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Wilgar Coleman, who, having been duly sworn according to law, deposes and says that he is the Editor of the N. E. L. A. Bulletin, and that the following is to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 411, Postal Laws and Regulations printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are: Publisher, National Electric Light Association, 420 Lexington Avenue, New York City; Editor, Wilgar Coleman, 420 Lexington Avenue, New York City; Managing Editor, none; Business Manager, none.

2. That the owners are: National Electric Light Association, 420 Lexington Avenue, New York City, Mutual Organization, not incorporated. Membership approximately 20,000. P. S. Arkwright, President, Atlanta, Ga.; P. S. Young, Treasurer, Newark, N. J.; Paul S. Clapp, Managing Director, National Electric Light Association, 420 Lexington Avenue, New York City.

3. That the known bondholders, mortgagees and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages or other securities are: None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders, and security holders, as they appear upon the books of the company, but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustee, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

Wilgar Coleman,
Editor.

Sworn to and subscribed before me this 5th day of April, 1929.

(Seal) Jessie S. Riker.
Notary Public, N. Y. County.
(My commission expires March 30, 1931.)

INFORMATION

The National Electric Light Association from time to time prints in pamphlet form informative, interesting articles and addresses by industrial leaders of the country, with the purpose of making them readily available to the membership of the Association.

It is felt that your public relations program will be aided through a judicious distribution of these pamphlets to the business and intellectual leaders of your city, either by direct mailing or by keeping a supply convenient for passing out to such visitors as may appear interested in reading them.

Three groups of six pamphlets each are especially recommended for this purpose, and they may be ordered in any quantity desired.

Group No. 1 consists of—

Fallacies with Regard to the Utilities (9 pages), by Howard T. Sands.
Financing the Utilities (12 pages), by Martin J. Insull.
Holding the Management Companies (52 pages), by Halford Erickson.
State Regulations of Public Utilities (30 pages), by William J. Hagenah.
Interconnection (7 pages), by George N. Tidd.
Public Utility Information Bureaus (20 pages), by H. M. Lytle.

The prices for Groups No. 1 are—

Single sets—35c.
100 or more sets—$32.50.
1000 or more sets—$30.00.

Group No. 2 consists of—

Labor's Part in Electrical Development (11 pages), by Hugh Frayne.
Shall Government Enter Business? (17 pages), by W. H. Onken.
Some Economic and Public Aspects of the Electric Industry as Viewed by a Layman (14 pages), by Melvin A. Traylor.
The Producer's Part in the Development of Power (15 pages), by J. F. Owens.
Progress, Prosperity and Horsepower (9 pages), by Lewis E. Pierson.
From Bottom Up or Top Down? (11 pages), by Merle Thorpe.

The prices for Group No. 2 are—

Single sets—15c.
100 or more sets—$12.50.
1000 or more sets—$10.00.

Group No. 3 consists of—

Electricity and the Farmer (13 pages), by Clifford V. Gregory.
Today's Science and Tomorrow's Engineering (14 pages), by L. A. Hawkins.
Driving Drudgery from the American Home (9 pages), by Mrs. John D. Sherman.
The Electrical Industry's Part in National Preparedness (13 pages), by Hon. Dwight F. Davis.
Electric Power and the Working Man (9 pages), by William Green.
That the Public May Know Us as We Know Ourselves to Be (9 pages), by J. F. Owens.

The prices for Group No. 3 are—

Single sets—18c.
100 or more sets—$15.00.
1000 or more sets—$12.50.

Sample sets will be mailed free upon request of executives of member companies.

Pamphlets may also be purchased separately at regular prices quoted in the price list of N.E.L.A. publications. This list will be mailed upon application.

NATIONAL ELECTRIC LIGHT ASSOCIATION
420 Lexington Avenue, New York

WOMEN'S COMMITTEE

Miss Sophia Malicki, *Chairman* Miss Isabel Davie, *Secretary*

News Letter

By Mrs. Thelma Van Ness

The March 22 meeting of the Women's Committee, Canadian Electrical Association, was held at the Queen's Hotel, Montreal, with an attendance of 170. Women employees of the Southern Canada Power Company at Richmond and St. Hyacinthe came to Montreal for the meeting. A pantomime was given showing how electricity speeds up the process of preparing for the day's work.

* * *

Mrs. Mabel Wilson, Chairman North Central Division Women's Committee, reports that all groups of the Women's Committee of her Division have been holding meetings regularly. All have had either a Department Head or an Executive present at these meetings. Playlets have formed a part of the entertainment and attendance has been induced by prizes in some of the groups.

* * *

Announcement is made of the formation in January of a Women's Committee in the Hawaiian Electric Company of Honolulu—incidentally America's first territorial Women's Committee. The Chairman, Miss Miriam Jackson, reports that the entire woman personnel of her Company is actively interested in the work of this Committee. An unusual feature of the Honolulu program consists of a "review question and answer contest" to be held in June, covering meetings of the previous six months. A cash prize will be awarded by the Company to the member submitting the best one-thousand-word essay.

* * *

No subject undertaken by the Pacific Coast Women's Committee has met with more widespread approval and response than First Aid. This is the first year the Pacific Coast has had representation on the Safety Subcommittee of the Women's Committee. Considerable credit is due to the consistent and persistent efforts of Miss Marge Myrick, of the San Diego Consolidated Gas and Electric Company, who has successfully promoted and maintained a high degree of interest in the subject throughout member companies of the Pacific Coast Electrical Association.

* * *

The honor of having the original Girls' First Aid Team on the Pacific Coast goes to the Los Angeles Gas and Electric Corporation girls who made their team debut at the Pacific Coast Gas Association Convention last fall. Several other teams are now hard at work, spending from four to eight hours per week perfecting First Aid technique. Women's Committees which include a First Aid Team among their activities are those in the Southern California Edison Company, Los Angeles Gas and Electric Corporation, San Diego Consolidated Gas and Electric Company, San Joaquin Light and Power Corporation, Salinas Division of the Pacific Gas and Electric Corporation and the Hawaiian Electric Company.

* * *

"Cinderella's House" is the name of a playlet in pantomime presented by the Women's Committee at the recent convention of the Kansas Section of the Middle West Division. Miss Betty Ewing of the Kansas Power and Light Company, Topeka, is the Chairman of this Division and Miss Elsie McMann of the Kansas Gas and Electric Company at Wichita directs the work of the Women's Committee in Kansas. The entire cast of this pantomime was made up of girls from these two companies. At this same meeting the Wichita Women's Committee, Kansas Gas and Electric Company, presented a First Aid demonstration entitled, "The Tragic Interlude."

* * *

Miss Cullie Clark won the public speaking contest held by the Women's Committee of the Nashville (Tennessee) Railway and Light Company. Others in the contest were Miss Dorothy Farmer, Miss Carmein Womack, Miss Jo Allyn Garner, Miss Elizabeth Wrye, Miss Mary Washburn and Miss Lottie Hamblen. All spoke on the subject "How a Woman Employee Can Help Her Company Merit the Confidence of Its Customers." *Rail-Light News* reports the contest as follows:

"Miss Clark's talk was plainly and forcefully presented, with charm and simplicity of manner as factors having weight with the judges, who were Dean Adabelle Stapleton of Vanderbilt; Jack Norman, Attorney, and Dr. W. D. Weatherford of the Southern Y. M. C. A. College.

"Not only Miss Clark's talk, but each of the seven, pointed out innumerable opportunities that women employees have for playing vital parts in our company's service to the public. The gratifying part is that the Women's Committee is seizing upon these opportunities and employing them in their every-day service to the public. The judges had a trying time choosing the winner. * * * Miss Clark will now represent the company in the State contest. * * *"

* * *

Among the Women's Committee members in the Southeastern Division who have been very active in public speaking work are several from Tennessee: Miss Selma Cohn of Memphis; Miss Susi Murphree, Miss Catherine Holloway and Miss Dorothea Lutzler of Nashville, and Miss Sylvia Richmond, Mrs. Mary M. Bushnell and Mrs. Dixie Sawyer of Chattanooga.

* * *

The New England Division comprising the States of Maine, New Hampshire, Vermont, Massachusetts, Connecticut and Rhode Island, under the chairmanship of Miss Alice M. Baker of the Hartford Electric Light Company at Hartford, reports steady progress. In the State of New Hampshire, Miss Grace A. Phillips, Chairman, reports the organization of a new committee at the New Hampshire Gas and Electric Co., Portsmouth. Nineteen lighting schools were held in a period of two months in as many different cities in New Hampshire and Vermont at which there was a total attendance of 1316 which included several women's clubs. The program included illustrated lectures showing the proper lighting and wiring for the home and also classes in lamp shade making.

* * *

From a Southwestern Division report we learn that new committees have been organized in Sand Springs, Okla.; Olney, Tex., and Bartlesville, Okla. At Searcy, Ark., and Algiers, La., committees are in the course of formation.

* * *

The Mississippi Power Company Women's Committee gave several parties in December, one each at Gulfport, Biloxi, Hattiesburg, Columbia, Meridian and Columbus. They were called Christmas parties and the general public was invited to attend. Range demonstrations were features of the programs.

* * *

The Little Rock Women's Committee furnished a float for the parade on the opening day of the Arkansas State Fair and then used it at the Rice Carnival where it won a prize. The float represented an electric iron and members of the Women's Committee appeared on it.

* * *

The New Orleans Public Service Company Women's Committee cooperated with the Housewives' League in a three-day demonstration. Members of the Women's Committee took charge of the booth. The Housewives' League now holds its monthly meetings in the Public Service Company auditorium. Miss Julie Pailet, Chairman of the Southwestern Division, is affiliated with this company.

* * *

From the *Oklahoma Meter* of the Oklahoma Gas and Electric Company, we learn that the Women's Committee at Enid, Okla., presented "Wanted—A Stenographer" at a Kiwanis Club Luncheon recently.

* * *

The girls of the Louisville Gas and Electric Company, Kentucky, have edited their company magazine, the *Synchronizer* for the month of March.

The cover is bright green and contains many clever little silhouettes of girls in a wide variety of poses. The magazine contains an article by Fanny S. McDonald, Chairman of this group.

* * *

At Hammond, Ind., the Women's Committee of the Northern Indiana Public Service Company is holding a series of meetings at which the girls give talks on the functions of the various departments in which they are employed.

* * *

At Baker, Ore., the Women's Committee held an Open House in the Company sales room, Eastern Oregon Light and Power Company, and served coffee and sandwiches to about one hundred people. At Payette, Idaho, the Women's Committee assisted the rural salesmen of the Idaho Power Company at their farm demonstration by serving refreshments. At Albany, Ore., the Women's Committee of the Mountain States Power Company took part in the program of the Kiwanis and Rotary Clubs. The Puget Sound Power and Light Company Women's Committee boasts an active basket ball team which is a member of the City League.

* * *

Miss Mary K. Walsh, Chairman of the Women's Committee, The Washington Water Power Company, recently gave a talk on the subject "Holding Company" before the Public Speaking Class of Washington State College.

* * *

Mrs. Gertrude McDevitt, Chairman of the Women's Committee, Idaho Power Company and Home Economist for the company, has made several talks to Women's Clubs in Idaho.

* * *

The Toledo Edison Company Women's Committee reports that two women won prizes selling shares in a Customer Ownership Campaign. This group has pledged $1,250 for the new Y. W. C. A. dormitory and is raising the money by bridge parties, etc.

* * *

Miss Ruth Menoher, Director of Home Service Department, and other girls of the Iowa-Nebraska Light and Power Company, have acted as hostesses at the opening of offices in Humphrey, College View, Humboldt and Havelock. Waffle demonstrations were given at Havelock, College View and Lincoln. The girls of the Lincoln office of the company took an active part in helping the sales department put over the Edison Mazda Lamp Campaign. This group of girls is called the Live Wire Club. It was divided into teams of ten persons. Each team had a captain and a name and as an incentive in the contest, the losing teams had to entertain the winning teams at a party. One of the teams was second in the all-employee contest and was awarded a prize. This club edits a monthly bulletin entitled *Live Wire Newsette*. The Club President, Mrs. Helen Weider, is a member of the Nebraska Women's Committee and is contributing editor to the State Bulletin, *W'ats Watt in Nebraska.*

* * *

The Women's Committee of the Missouri Gas and Electric Service Company at Lexington is cooperating with the Business and Professional Women's Club and the Women's Club of the city. Nearly all the members of the Women's Committee are also members of these two clubs. The girls of the Emporia Division, Kansas Electric Power Company, are also members of the Business and Professional Women's Club. At Newton, Kan., the girls of the Idaka Club of the Kansas Gas and Electric Company are members of the Business Women's Club and two of the girls are officers.

* * *

The first executive meeting of the Women's Committee leaders in the Pacific Coast section was held at Fresno, Cal., March 21 and 22. Practically all Committee Chairmen and Members-at-Large in the State attended. Mrs. Ruth E. Creveling, Chairman, reports that the round table discussions were most interesting and profitable.

* * *

At a recent meeting of the Oklahoma Gas and Electric Company Women's Committee at Muskogee, a very interesting talk on the use of electricity on the farm was given by Mrs. Vera Carding, county home demonstration agent.

* * *

A new department has been opened at the Oklahoma City office of the Oklahoma Gas and Electric Company—the Scientific Health Department — with Greta Offut in charge. There was a recent meeting of O. G. & E. girls for the purpose of organizing a class on "Keeping Physically Fit." This is in connection with the use of the Health Stimulator.

* * *

Safety work is receiving much attention by the Women's Committee of the Illinois Northern Utilities Company. The Freeport, Ill., Women's Committee presented the playlet "Never Say Die" to the student body of the High School.

Permanent Home Making Center in New York

THE New York State Federation of Women's Clubs has recently opened a permanent Home Making Center in the Grand Central Palace, New York City.

This is the first time, it is stated, that a large institution has been set up as a definite place for the all-around study of home and home problems, where a continuous program of information and instruction is carried on. According to the announcement of the Home Making Center:

"Clergymen, doctors, psychiatrists, college professors, home economics experts in teaching, and specialists in business have offered their service to help make our dream come true. We shall have moving pictures, lectures, music, drama and poetry, fashion shows, and illustrated talks on child care and training, and, in short, a thousand subjects of interest.

"Every morning some school is coming in to see it, every afternoon a large women's club will meet here and at another hour the general public will be given the same type of program. The evenings are given over to business women and to men and their home interests and problems. It is the beginning of a new era in the consideration of Home as an entity."

Women's Committee at the Atlantic City Convention

A MEETING of the Women's Committee will be held in Atlantic City on Monday, June 3, at three o'clock in the Garden Lounge of the Dennis Hotel.

Subjects relating to all phases of Women's Committee work will be discussed by members from various sections of the country, and we hope the largest number of committee members will attend this meeting and bring to it their experiences and suggestions.

This year's convention of the National Electric Light Association is one of especial interest to women because of the observance of the Light's Golden Jubilee and the many thoughts it will give for carrying out special lighting programs in the several communities.

MAGAZINE ARTICLES

BELOW IS A LIST of articles which appeared in various magazines recently that are especially interesting to Women's Committee members:

Modern Priscilla—April
- The Lighting Problem and How to Solve It—Eloise Davison.
- The Housewife Looks at Laundry Equipment—Margaret H. Hartnett.

Good Housekeeping—April
- Are You Wire Bound—George W. Alder.

Sunset Magazine—April
- Has Your Home Adequate Refrigeration—Ernest Olmstead.

People's Home Journal—April
- Dishwashing—Elizabeth C. Condit.

Ladies' Home Journal—April
- Choosing an Electric Washing Machine—Elizabeth S. Ferguson.

Delineator—April
- What You Need to Know About Fuses and Circuits.

Better Homes and Gardens—April
- Modern Laundries Banish "Wash Day Blues"—Dorothy Knight.

Course in Electrical Household Equipment at Purdue University

By William Stokes
Manager Indiana Public Utilities Association

IN cooperation with the School of Home Economics of Purdue University, Lafayette, Ind., the electric and gas companies of the Hoosier State the last week in March acted as sponsors for a Short Course in gas and electrical household equipment at the University. Almost one hundred women employed in the gas and electric business from Indiana, Wisconsin, Michigan, Illinois and Ohio attended the course.

The course was planned primarily for women engaged in the gas and electric branches of the public utility industry in order to increase the knowledge of these women as to non-technical as well as technical information on the subjects of home economics, household equipment, and the general fundamentals of the utility business. Dean Mary L. Matthews of the School of Home Economics of the University was in active charge of the course. Manufacturers of many kinds of gas and electric operated household machinery and appliances sent liberal displays of their products to the University for the work of the Short Course.

Beginning with an address of welcome by Dean Matthews on Monday, March 25, the women attending the course were kept busy throughout the week with lectures, demonstrations and laboratory work. Many of the leaders in home economics of the country were present. In addition to Dean Matthews the following persons and their subjects appeared on the program:

"Aims of the Conference"—Miss Lois Anderson, Chairman of Indiana Division of National Electric Light Association, Indianapolis; "The Romance of the Public Utility Industry"—Morse DellPlain, Vice-President of the Northern Indiana Public Service Company, Hammond, Ind.; "The Future of Your Job in the Gas Industry"—Mrs. Anne J. Peterson, Home Service Department, Peoples Gas, Light & Coke Company, Chicago; "Gas and Its Application to Household Appliances"—E. J. Good, Sales Manager, Northern Indiana Public Service Company, Lafayette, Ind.; "Gas for House Heating"—Prof. R. B. Leckie, Gas Research Department, Engineering Experiment Station, Purdue University; "Some Points in Making a Good Demonstration"—Miss Mary I. Barber, Home Economics Department, Kellogg Company, Battle Creek, Mich.; "Cultivating Skill in Telling the Story of Gas and Electrical Equipment"—T. R. Johnston, Bureau of Publicity, Purdue University; "The Home-Maker's Use of Time"—Hildegarde Kneeland, Bureau of Home Economics, U. S. Department of Agriculture; "Electrical Units and Measurements and Their Application to Household Equipment." Prof. A. N. Topping, School of Electrical Engineering, Purdue University; "Why Save Labor"—Dr. Grace S. Zorbaugh, Professor Household Administration and Economics Science, Iowa State College.

"Gas Water Heaters" — Waldo W. Schram, Northern Indiana Public Service Company, Hammond; "Electric Water Heaters"—Prof. D. L. Curtner, Electrical Engineering Department, Purdue University; "Reliable Sources of Information on Home Equipment"—Dean Mary L. Matthews; "Mechanics of Gas and Electric Household Refrigerators"—Prof. H. J. Macintire, Department of Mechanical Engineering, University of Illinois; "Factors in the Management of Household Refrigerators"—Miss Ruth Jordan, Home Economics Department, Agricultural Experiment Station; "Fundamentals of Home Lighting"—Mrs. Frances S. Rosenburg, Home Lighting Engineer, Commonwealth Edison Company, Chicago; "Decorative Lighting in the Home"—Miss Helen G. McKinley, Home Lighting Specialist, Edison Lamp Works; "How Electricity Can Serve the Farm Homemaker"—Prof. E. W. Lehmann, Agricultural Engineering Department, University of Illinois; "The Farm Home and Electricity"—Mrs. R. M. Brown, Goshen, Ind., and "How Do We Decide What Labor Saving Equipment We Need in the Home"—Eloise Davison, Home Economics Advisor, National Electric Light Association.

In arranging the program and carrying out the work of the week Dean Matthews had the assistance of Miss Miriam Rapp of the staff of the Agricultural Experiment Station of the University. Other members of Dean Matthews' staff also assisted in demonstrations and laboratory work.

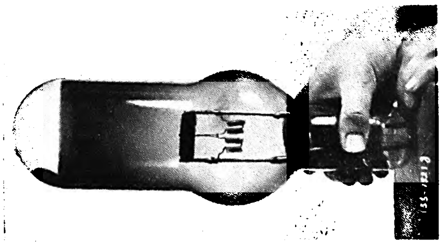
SPECIAL COMMITTEES

*Removing Blackening from Bulbs of High Wattage Lamps

THE ordinary sizes of lamps generally fail at the end of their rated average life by reason of filament rupture. With high wattage, high current lamps, such as are used in motion picture studio and aviation field lighting, the filament is relatively so thick and the bulb is relatively so small, that the end of the useful life of such lamps is not due to filament failure, but is generally caused by bulb blackening. This bulb blackening, due to the deposit of tungsten evaporated from the filament, not only causes a marked decrease in illumination, but also causes the darkened bulb to absorb a much greater amount of radiant energy from the hot filament with the result that, in many cases, the bulb devitrifies, softens and fails.

The Mazda lamp manufacturers recently have perfected a novel method of getting rid of this blackening by placing a small quantity of rough tungsten crystals in the bulb. This scheme has been considered for several years, but all the various scouring substances formerly tried, such as sand, gave off moisture or other vapors which affected the lamp deleteriously. The new construction utilizes crystals made by a new process, recently developed. When the bulb becomes appreciably blackened, the lamp is removed from the socket and rotated or shaken slightly. This causes the tungsten crystals to scour off the blackening from the inside of the bulb.

The illustration shows a blackened lamp from which part of the blackening has been scoured off. The small quantity of tungsten crystals in the bulb can also be seen.



High Wattage Lamp from Which Part of the Bulb Blackening Has Been Removed by Rotating the Tungsten Crystals in the Bulb

This development has made it possible considerably to increase the rated efficiency of high wattage lamps, as their life is now largely limited by filament failure. Lamps formerly designed for an efficiency of 26 lumens per watt will now operate at 30 and possibly as high as 32 L. P. W. and, of course, with much better lumen maintenance.

Convention Delegates Invited to S.E.D. Headquarters

KENNETH A. McINTYRE, managing director of The Society For Electrical Development, extends a cordial invitation to all members of the N.E.L.A. to visit S.E.D. headquarters at 420 Lexington Avenue, New York, while they are en route to or from Atlantic City during the June convention.

---

*Contributed by Lamp Committee, Frank W. Smith, Chairman.

WHAT OCCURRED LAST MONTH

Agriculture and Electricity

An announcement by the Empire State Gas and Electric Association says that 5800 farms in New York State were added to rural electric service lines during 1928, bringing the present total to 47,800, or more than 25 per cent of all farms in the state.

* * *

Adopting the plan already put in effect by the New England Power Association and the Public Service Company of New Hampshire, the Twin State Gas and Electric Company of Dover, N. H., has put in effect the five-year monthly payment arrangement for extension of electric light and power lines into the rural districts of New Hampshire.

* * *

The annual report of President Martin of the Alabama Power Company says that 51 of the 67 counties of Alabama now have rural electrification lines. The construction of 133 new rural lines during 1928 marked the greatest progress made by the company in this direction in any one year.

* * *

Announcement is made by the American Farm Bureau Federation that Mrs. Charles W. Sewell, a farm woman from Indiana, for the last several years in charge of the Home and Community Department of the Federation, is available for public addresses on the subject, "The Development of Farm Home Life," before industrial or business groups, conventions, etc.

* * *

Earnings of Utilities

Gross earnings of public utility enterprises in February, exclusive of telephone and telegraph companies, as reported to the Department of Commerce by ninety-five companies or systems operating gas, electric light, heat, power, traction and water services, were $194,000,000, as compared with $203,000,000 in January, and $187,383,731 in February, 1928. Net earnings were $86,000,000 as compared with $74,296,576 in February, 1928.

* * *

Consolidations, Etc.

Announcement has been made of the formation of the International Hydro-electric System, as a subsidiary of the International Paper and Power Company, to take over 82 per cent of the outstanding common stock of the New England Power Association and the entire common and second preferred stocks of Canada Hydro-Electric Corporation, Ltd. The new company is formed as a Massachusetts voluntary association.

* * *

The Southern Ohio Electric Company of Athens has been given leave by the Ohio Public Utilities Commission to file an amended petition asking authority to purchase the United Ohio Utilities Company of Columbus and the Chillicothe Electric Railway, Light and Power Company.

* * *

The Commonwealth Utilities Corporation of St. Louis has purchased a controlling interest in the Arizona Power Company.

* * *

The Arkansas Power and Light Company has bought the Arkansas Public Service Company properties, the deal including light, water and ice plants in six cities in Arkansas.

* * *

An announcement made by the Fall River, Mass., Electric Light Company says that the New England Power Association and the Eastern Utilities Associates have acquired control of the Fall River Company.

* * *

An announcement of April 24 says that the United Power, Gas and Water Corporation has been formed as a $200,000,000 holding company to acquire not less than 79 per cent of the outstanding Class B common stock of the Federal Water Service Corporation, and all of the Class B common stock of the People's Light and Power Corporation. Subsidiaries of the systems involved operate in twenty-one states. George L. Ohrstrom is to be president of the new company.

* * *

Federal Power Commission

The Federal Power Commission announced that eight applications for licenses under the Water Power Act had been filed with it from March 1 to March 24, making a total of 973 received to that date. Among the applications is one of the city of Tacoma, which has applied for a preliminary permit to develop power in the South Fork of Skokomish River, fifteen miles northwest of Shelton, Washington. About 39,100 horsepower would be developed for use in the municipal system of Tacoma. Other applications are from James B. Girand, who asks for licenses for projects on the Salt River in Gila County, Arizona.

* * *

An opinion by Major L. W. Call, Chief Counsel of the Federal Power Commission, on the Commission's jurisdiction over rates and services of public service corporations, recently submitted to the Commission, has been approved by it and thereby becomes a ruling of the Commission. This opinion states that the Commission's jurisdiction over rates and services extends as far as they constitute interstate or foreign commerce and also extends to the securities of licensees, subsidiary corporations and to persons, associations and corporations purchasing power from a licensee for distribution or use in public service.

* * *

Federal Trade Commission's Investigation

On March 22, the Federal Trade Commission listened to testimony of Walter L. Frost, former president of the Pacific Coast Electrical Association, who told of activities of the association and its financial relationship with the N. E. L. A.

* * *

On March 28, at the Federal Trade Commission's hearing, N. W. Brockett, secretary of the former Washington Committee on Public Utility Information, gave testimony concerning activities of that organization, including publicity in opposition to certain proposed legislation bearing on utilities.

* * *

The Federal Trade Commission, on April 16, sent to the Senate its Thirteenth Interim Report on the public utilities inquiry. The report says that examiners have begun work on the books of a holding company in Chicago and are continuing investigation of others. It is announced that, with the completion of the publicity phase of the investigation, the financial activities of the utilities will be investigated.

* * *

On April 16, at a hearing before the Commission, a number of exhibits relating to publicity activities of electric companies in southern and western states were introduced. No witnesses were heard. On April 17, State Senator Herbert C. Jones of California testified concerning activities of California electric companies in connection with the proposed State Water Power Act.

* * *

On April 23, the Federal Trade Commission announced that hearings on publicity activities would be continued on April 25 and on May 1, and gave a list of witnesses from Pacific Coast organizations who had been asked to appear. Witnesses for April 25 were H. B. Sawyer of Boston, treasurer of the Sierra Pacific Power Company, and William T. Crawford, secretary of the same company.

* * *

The Federal Trade Commission, at a hearing on April 30, heard testimony concerning the purchase of a half-interest in the *Boston-Herald* and *Boston Traveller* by the International Paper Company, a subsidiary of the International Paper & Power Company, Mr. A. R. Graustein, president of the International Paper & Power Company, and Mr. Robert L. O'Brien, former president of the Boston Publishing Company, publisher of the papers, being the witnesses. Mr. Graustein gave a full account of the financial relationship of the International Paper Company with thirteen papers in which it has an interest, explaining that the company's motive in such relationship was to furnish an outlet for newsprint, and declaring that his company had nothing to do with editorial policies.

* * *

Foreign

The Chief Concessions Committee of the Soviet Union has recently announced a list of openings for concessions covering central power stations. These involve ten projects ranging from 20,000 to 200,000 kilowatt capacity. Some are for steam plants and others for hydro-electric development.

* * *

A report from London to the Department of Commerce says that reorganization of the generation and transmission of electricity throughout Great Britain is proceeding actively under the direction of the Central Electricity Board. It is probable that the Board will be in a position to supply electricity on a small scale in both central Scotland and southeast England (which are two of the five regional schemes) before the middle of 1929.

* * *

Hydro-Electric

At the convention of the American Society of Mechanical Engineers, held in Knoxville, Tenn., Professor J. A. Switzer of the University of Tennessee said that the recently-completed survey of the Tennessee River Basin by army engineers shows 141 separate power sites.

* * *

The Joint Water Power Committee of the Tennessee Senate and House has rendered a report to the Governor and to the Legislature on the hydro-electric situation in Tennessee. The report urges hydro-electric development of the Tennessee River Basin by private enterprise, opposes construction of the Cove Creek Dam by the federal government and also opposes imposition of a tax of one mill per kilowatt-hour on hydro-electric current.

* * *

The Government of the Province of Manitoba has decided to grant to the British Dominion Power Company the right to develop hydro-electric power at White Mud Falls, the 600,000-horsepower site on the Nelson River. The proposal calls for reservation of a large block of power for the Provincial Hydro Commission at cost. It is estimated that $20,000,000 will be invested.

* * *

A recent report to the Department of Commerce says that France is the third nation in the world, being surpassed only by the United States and Canada, in the amount of hydro-electric power generated annually. The report states that through government action France has complete coordination of development and interconnection of hydro-electric plants, whether constructed, in process of construction, or projected.

* * *

The Joint Legislative Committee on Water Conservation and Development of California has made public its report after a study of the situation over two years. The report recommends expenditure by the state of $109,000,000 for dams, power plants, flood control and irrigation.

* * *

On April 23, it was announced that the Union Electric Light and Power Company, a subsidiary of the North American Company, is planning to build a hydro-electric power plant on the Osage River, at Bagnell, Mo., at a cost in excess of $30,000,000. The power plant is to have an initial capacity of 120,000 kilowatts, with provision for additional generating units up to a total of 160,000.

* * *

Municipal Plants

Voters of Angelica, N. Y., at an election in March, rejected a proposal to sell the municipally-owned electric plant. An election at Sidney, Neb., resulted in favor of the sale of the municipal electric plant there. Chippewa Falls, Wis., has voted down a proposal to buy the privately-owned electric distribution system in that community. The towns of Claremont, Mooresville and Mocksville, N. C., have voted to sell their municipal electric distribution systems.

* * *

Investigation of the financial condition of the municipal light department of Concord, Mass., made under the direction of Director Theodore N. Waddell of the State Division of Accounts, disclosed that some 650 residents of that town owe more than $53,000 for lighting service. The bills run from one dollar to $2,185, according to the report, which also states that in some instances meters had not been read in years despite the fact that current was continually being used.

* * *

The Tennessee Legislature has passed a bill enabling the City of Jackson to spend $1,000,000 for municipal electric and gas plants.

* * *

Niagara

The Public Committee on Power of New York State has sent an open letter to Senator Wagner condemning the treaty between the United States and Canada for diversion of additional water from Niagara Falls, principally on the alleged ground that the provisions of the treaty are favorable to a private company and not to the public.

* * *

Production of Electricity

The Department of Commerce reports that the output of electric current in the United States in 1927 was 74,654,531,374 kw-hr., against 40,291,536,435 kw-hr. in 1922, an increase of 85.3 per cent. During the period from 1922 to 1926 there was a sharp decrease in the number of individual electric plants, the department reports.

* * *

The Geological Survey reports that production of electricity by public utility plants in February was 7,444,000,000, an increase of 8 per cent over February, 1928. (The increase per day in February, 1929, over February, 1928, was nearly 13 per cent, February, 1928, having 29 days.)

* * *

The United States Geological Survey reports total production of electric current by public utility plants in New England during 1928 to be 5,939,035,000 kw-hr., an increase of 8.6 per cent over 1927. Of this, 2,371,981,000 were produced by water power.

* * *

The Department of Commerce announces that the total output of electric current in New York State in 1927 was 9,917,685,550 kw-hr., an increase of 82.6 per cent over production in 1922.

* * *

The Dominion Bureau of Statistics, in a report on electric power output of central electric stations in Canada for the year 1927, says that hydro-electric stations generated 98.6 per cent of the total production of 14,549,099,000 kw-hr. The output of the central stations was slightly less than 50 per cent of the total capacity of installed equipment if operated 24 hours per day.

* * *

Rates

The Tidewater Power Company has filed with the North Carolina Corporation Commission voluntary reductions in electric power rates, effective April 1.

* * *

About 30,000 domestic and commercial consumers of electricity in northern West Virginia will have their rates lowered under a new schedule filed with the Public Service Commission by the Monongahela-West Penn Public Service Company.

* * *

The Syracuse, New York, Lighting Company and the city officials of Syracuse have reached an agreement for a substantial reduction in rates for residential service.

* * *

The municipal systems of Holyoke and Chicopee, Mass., have announced reduced rates, the initial lighting rate in each case being 5 cents.

* * *

Reduced rates for Corning, Hornell, and adjacent New York communities, offered by the New York Central Electric Corporation, have been approved by the Public Service Commission.

* * *

The Illinois Power and Light Corporation has announced reduced rates for retail power, effective April 1, and has filed the schedule with the Illinois Commerce Commission.

* * *

The Knoxville, Tenn, Power and Light Company announces new rates which will save its customers about $50,000 annually.

* * *

The municipal plant of Wolfeboro,

N. H., announces reduced rates beginning May 1. The initial rate for lighting will be 13 cents.

* * *

The Houston, Tex., Lighting and Power Company announces a new schedule of rates, which will mean a saving of about 10 per cent for residential consumers.

* * *

The Appalachian Electric Power Company has announced a voluntary reduction in power rates to affect what is known as the Bluefield district in Virginia. This will mean a saving of about $30,000 annually to consumers. This same company announces lower rates for the towns and rural communities of the Roanoke-Lynchburg division, which will mean a saving of about $74,000 to customers.

* * *

The Wisconsin Public Service Corporation is to put into effect a new rate schedule which will benefit small users of electricity in the Green Bay, Oconto, and Oshkosh districts to the extent of about $42,000 annually.

* * *

The rate reductions for agricultural power, agreed upon last year as a result of negotiations between the San Joaquin, Cal., Light and Power Corporation and the California Farm Bureau Federation, whereby farmers of San Joaquin Valley will save about $300,000 annually, went into effect April 1.

* * *

The Southern Canada Power Company of Quebec Province announces lower residential rates to go into effect on May 1. The new rate will be $1.50 per month, plus 3 cents per kilowatt-hour, and customers will be permitted to use one meter for all household uses, including lighting, cooking, refrigeration, oil burners, radios, etc.

* * *

The Union Light, Heat & Power Co. of Fargo, N. D., has filed with the State Railroad Board a schedule calling for substantial reductions in the wholesale power and light rate and the wholesale industrial power rate.

* * *

City officials of Shreveport, La., and officials of the Southwestern Gas & Electric Co., after negotiations, have reached an agreement on rates for electric light and power which will mean a saving of about $139,000 per annum.

* * *

The Laporte, Ind., Gas & Electric Co. has announced a new schedule of reduced rates, effective May 1, which has been approved by the Indiana Public Service Commission.

* * *

Regulation

A bill introduced in the Minnesota House calls for regulation of water power in the state. Regulatory power would be vested in the present Railroad and Warehouse Commission. The Committee on Public Domain of the Minnesota Senate has approved the proposal for a committee to investigate the situation in northern Minnesota for the purpose of determining a state policy on water power development.

* * *

A bill has been introduced in the Wisconsin Legislature to create the office of Public Utility Director, who would be appointed by the Governor and would serve the cities and customers of public utilities, either alone or with other agents or attorneys, in matters pertaining to rates, security issues or service. The salary and expenses of the Director would be paid from the appropriation for the Railroad Commission and he would have access to all records of the Commission.

* * *

The New Hampshire Legislature is considering a bill giving authority to the Public Service Commission to charge utility companies with the expense of investigations undertaken by the Commission as a result of petitions from the utilities.

* * *

A resolution has been introduced in the Michigan House calling for a legislative investigation into the Michigan Public Utilities Commission.

* * *

A resolution has been introduced in the Wisconsin Legislature providing for investigation of the Railroad and Tax Commissions, together with the entire subject of regulation and taxation of public utilities, the inquiry to be conducted by a special joint committee of the Legislature.

* * *

The Judicial Committee of the Missouri House has held a hearing on the bill prepared by the City Counselor of St. Louis to establish 7 per cent as the maximum rate of return for public utilities.

* * *

Dispatches from Jefferson City say that the general terminable permit bill, originally applying to all utilities except telephone companies, has been practically killed in the Missouri House by amendments which have been attached to it.

* * *

A bill introduced in the Oklahoma House provides for employment by the State Equalization Board of a qualified tax specialist to assist the proper officers in discovery of property belonging to Public Service Corporations that has not been listed and assessed as required by existing laws. The Legislature has passed and sent to the Governor the bill authorizing municipalities to own and maintain property outside of corporate limits and to issue bonds for the purchase of such property.

* * *

The New York Legislature shortly before adjournment passed the Thayer-Dunmore Bill, creating a Commission of nine members to make a survey of utility regulation in the state and to report recommendations to the next legislature.

* * *

A bill considered by the Pennsylvania Legislature, which would have required approval by the Public Service Commission of new rates before they could become effective, has been indefinitely postponed.

* * *

The Oklahoma Legislature has passed a bill authorizing municipalities to own and maintain property outside of corporate limits and to issue bonds for the same. This bill was intended primarily to enable municipalities to acquire and maintain airports outside of the city limits.

* * *

The Nebraska Senate has passed a bill that all public utility franchises awarded by cities of 5,000 to 25,000 population, also villages and cities of the second class, be for no longer than twenty-five years and that maximum rates be stated in the franchises, and that a 60 per cent vote of electors in cities of the second class, and in villages, be required for the sale of municipal plants. The Nebraska House has decided to give consideration only to such utility bills as have passed the Senate.

* * *

On April 8, the Committee on Power and Light of the Massachusetts Legislature voted for a favorable report on the bill approved by the Massachusetts Department of Public Utilities, which would rescind the present requirement of Massachusetts law that municipalities before entering the public utility business must acquire the privately-owned property serving the communities in question. According to the bill which the Committee recommends, the question of determining whether private plants shall be taken over is left in the hands of the Department of Public Utilities. The Department may say that any city or town, after the appropriate votes have been taken, may enter the electric business; the Department may determine whether the private plant shall be taken, or may even decide that even a part of an existing plant shall be purchased. The bill now goes to the Ways and Means Committee.

* * *

The New York Public Service Commission has announced that it has postponed further hearings in the matter of submetering until the early fall.

* * *

The Wisconsin Assembly has passed the bill to include public utilities in the income tax, on the same basis as other corporations. The measure now goes to the Wisconsin Senate.

* * *

New bills introduced in the Wisconsin Legislature include one limiting rates to be charged for electric current to tenants by landlords to the rates charged by utility companies for the same service; one providing for the creation of electric light and power districts to be owned and operated by groups of cities, towns, villages, or counties; one permitting municipalities to compete with existing utilities; and one permitting municipalities to install their own street-lighting without applying to the Railroad Commission.

* * *

A bill passed by the Maine Legislature, providing for export of surplus power if the proposal is ratified by the voters in September, and calling for an excise tax of 4 per cent on the selling price of the power, also provides that one half of the receipts of this tax for ten years will be devoted to the construction of rural electric service facilities, the maximum so devoted to be not more than $250,000 per annum.

* * *

A bill has been introduced in the Michigan Legislature providing for the incorporation by any two or more cities, villages or townships, or any combination or parts of the same, of a metropolitan district or districts comprising territory within their limits for the purpose of acquiring, owning and operating, either within or without their limits, parks or public utilities.

* * *

The Rushton bill, which provides for regulation of gas and electric utilities and requires them to secure from the Public Service Commission a certificate of convenience and necessity in certain cases, passed the Michigan House and Senate, but was afterwards reconsidered and amended to exclude municipal corporations from the provisions of the bill.

* * *

Bills introduced in the Minnesota Legislature prohibit raising the levels of any waters in Minnesota which are a part of international boundary waters. One object of the bills is to prevent a proposed hydro-electric development by private interests which would be based upon the use of waters along the Canadian boundary.

* * *

The special Intermin Water Power Committee of the Wisconsin Legislature has gone on record as favoring a constitutional amendment to authorize the state to take over water power sites at the end of thirty years and engage in the business of generating and distributing electric current therefrom.

* * *

St. Lawrence

The proposal made by Governor Roosevelt of New York for a Board of Trustees to work out a plan for developing water power resources on the St. Lawrence was shelved by the New York Legislature on March 26, when the Senate refused to take the bill from the committee considering it. This means no action on it for this session.

* * *

On April 10, Secretary of War Good, in an address before the Bankers' Club of Chicago, declared that according to estimates of the Army Engineers a St. Lawrence waterway suitable for ocean-going traffic can be provided for $125,000,000 to $150,000,000, after crediting the improvement with the share of costs chargeable to power. He asserted that economists calculate that 23,000,000 tons of freight would use this seaway annually.

* * *

On April 17, two resolutions bearing on the St. Lawrence project were introduced in the House of Representatives at Washington. One would put the United States government on record as being ready to proceed with the waterway as soon as Canada signifies its approval; the other provides that the report of the International Joint Commission, which, in 1922, completed and submitted a study of the project, be accepted by Congress, and further provides that President Hoover be authorized to negotiate with Canada for appointment of an International Board of Engineers to report within one year on detailed plans for construction and control of a waterway.

Virginia Rural Electrification Conference

LEADING authorities on rural electrification will take part in a conference to be held in the Agricultural Engineering Department of the Virginia Polytechnic Institute, Blacksburg, June 12, 13 and 14, according to announcement made by Professor Chas. E. Seitz, head of the V. P. I. Agricultural Department. This conference or "rural electrification short course," was arranged by Professor Seitz with the Virginia Committee on Relation of Electricity to Agriculture and The Public Utilities Association of Virginia cooperating.

This is said to be the first short course of its kind in the Southeastern States, and Professor Seitz already has assurances that there will be a large attendance from the electric utilities in Virginia, and, he hopes, adjoining States will be represented.

This short course at V. P. I. follows closely upon the conference on rural electrification called by Governor Byrd, and which resulted in the creation of the Virginia Committee on Relation of Electricity to Agriculture, whose members were drawn from the leaders of electric power companies and farm organizations in the Old Dominion.

Returns in Industrial Electric Heat Contest

THE number of submittals received in the NEMA-NELA Slogan Contest indicates a general interest in the subject of industrial electric heat on the part of many industries, according to an announcement from the National Electrical Manufacturers Association.

This contest, which closes May 30, is sponsored by the manufacturers and the National Electric Light Association to obtain a slogan descriptive of electric heat in industry. Seven prizes, totaling $500, will be awarded.

Further details of the contest were published in the March, 1929, issue of the N. E. L. A. BULLETIN, or may be obtained by writing to NEMA, 420 Lexington Avenue, New York City.

Elks Lodge Extends Invitation to Convention Delegates

THE Association is in receipt of the following communication, which has been acknowledged with appreciation:

"Atlantic City Lodge No. 276, B. P. O. Elks, extends to the Officers and members, of the National Electric Light Association, the courtesies of their Home, during their Convention, realizing they seek a certain recreation, in connection with the business they have to do with, and we would greatly appreciate it if you will make this known to them.

"Instructions will be given to our doorman to admit any of your members who shows the proper credentials of your body."

ATLANTIC CITY LODGE No. 276
B. P. O. Elks,
GEO. B. STODDARD, *Secretary.*

New Additions to List of Exhibitors

SINCE the list of exhibitors at the 1929 Convention and Exhibition was published in the April issue of the BULLETIN, the following changes have been made:

ADDITIONAL EXHIBITORS SINCE LAST ISSUE OF N. E. L. A. BULLETIN

American Ironing Machine Company	Chicago, Ill.
F. A. Bartlett Tree Expert Company	Stamford, Conn.
The Bristol Company	Waterbury, Conn.
Chicago Concrete Post Company	Chicago, Ill.
Condit Electrical Mfg. Corp.	Boston, Mass.
Curtis Lighting, Inc.	Chicago, Ill.
Dayton Pump & Machinery Corp.	Dayton, Ohio
Dexter Rubber Corp.	New York, N. Y.
Duplexalite Division of The Miller Company	Meriden, Conn.
Kellems Products, Inc.	New York, N. Y.
Liberty Gauge & Instrument Co.	Cleveland, Ohio
Master Electric Co.	Dayton, Ohio
Reading Sheet Metal Products Co.	Reading, Pa.
Silvray Company, Inc.	New York, N. Y.
Syracuse Washing Machine Co.	Syracuse, N. Y.
Trumbull Electric Mfg. Co.	Plainville, Conn.
Vacuumizer Mfg. Corp.	Rochester, N. Y.
Wilson Rubber Company	Canton, Ohio

EXHIBITORS WHO HAVE WITHDRAWN FROM EXHIBITION SINCE LAST ISSUE OF N. E. L. A. BULLETIN

Walter Bates Steel Corp.	Gary, Ind.
Central Flatiron Mfg. Co.	Johnson City, N.Y.
Hoe Corporation	Poughkeepsie, N.Y.
W. J. Loth Stove Co.	Rochester, N. Y.
Rainbow Appliance Corp.	New York, N. Y.
Seth Thomas Clock Co.	Philadelphia, Pa.
Wright Appliance Co., Inc.	Waynesboro, Va.

Picked up from

ELECTRICAL NEWS ITEMS

Issued weekly by Department of Public Information, National Electric Light Association, 420 Lexington Avenue, New York City. All or part may be used without further notice and with or without credit being given.

Electricity in the Slaughter House

TO the average American the thought of the slaughter house of a great meat packing company is more than distasteful, and is one of the sights of the meat industry which he has no desire to see. He has visions of the passing of long lines of cattle and the monotonous swinging of a gory pole-axe by hulking brutes who do not seem quite human.

Now comes a large meat packing company in Europe which, according to Floyd Parsons, has substituted electricity for the slaughter of animals. According to veterinary surgeons the death of cattle by electrocution is instantaneous and painless. An electrode is attached to the neck and another to the spine. After intensive investigations, approval of the method has been given by the government and by the Society for the Prevention of Cruelty to Animals.

Electric Welding

THE average citizen when he hears of electric welding thinks of it only as a new process whereby the terrible noise of construction work which is constantly going on, particularly in the larger cities, will be eliminated. What he does not know is that this method of welding has been an important contributing factor in the construction of the monster electric generator of modern times.

Until comparatively recent days the makers of large generators had to cast the metal in molds, with many consequent chances for imperfections. Now the machines can be assembled in pieces and welded together by electricity, assuring a job that is one complete piece.

This method has been investigated by the National Electric Light Association. In a recent report prepared by a committee on the subject one of the manufacturing companies is quoted as follows:

"There are several reasons for the recent tremendous increase in the use of structural steel and welding as a substitute for the use of castings. The cost of constructing patterns and the expense of storing them, the loss occasioned by defects in the castings, and the likelihood of failure in service as a result of internal strains, blowholes and the like, are some of the disadvantages of the old method of construction. They have long been appreciated by the industry and have been tolerated only because of the fear that some other form of structure would give rise to other troubles of even more serious nature.

"With the development of flame cutting of steel plate and with the increased knowledge of the art of welding, however, the designers have become convinced that steel plate will not only eliminate casting defects but will also produce better mechanical structures. In fact, factory tests have demonstrated that the new method of construction eliminates the disadvantages of castings, and produces a structure superior in strength and reliability to the cast structure."

Osciographoscope Bares Human Hearts

AN electrical engineer, Edward H. Hansen, of Los Angeles, Cal., reports that he has perfected an invention by which a motion picture camera can take photographs of a heart pulsating within a living person, according to *Popular Science Monthly*. He calls his machine an osciographoscope and says it will bring about a new system of diagnosis for heart ailments.

The stethoscope records only the sound of the heart in action. The X-ray allows it to be seen, but it does not give any permanent record for study. The new device, says the inventor, will record the slightest pulsation or change in the heart, so that the picture, thrown on the screen, can be examined and studied by several physicians.

"Considered as a piece of machinery," *Popular Science* continues, "the human heart is about the most efficient part of the body. It works continuously for half a century and more; sometimes for a hundred years; without stopping to be overhauled for repairs. It is composed of muscles which are extremely tough. They expand and contract with rhythmic regularity at an average rate of seventy pulsations a minute. The average life of an American is now about fifty-five years. In that period his heart will have pulsated two billion, one hundred and forty-four million, two hundred and thirty thousand times!

"It is only 300 years since William Harvey published his discovery of the circulation of the blood, in 1628. In those three centuries we have learned about the mechanism of the heart. We know that its operation is that of a pump. Each expansion draws into the left ventricle, one of the four chambers of the heart, about four tablespoonfuls of blood which has completed its seven-minute circuit of the body and has been supplied with fresh oxygen by the lungs. The blood passes through the four chambers, being forced out into the arteries through the tricuspid valve at the top of the right auricle.

"And that is about all we really KNOW about the heart. There is still much to learn about why and how infections and nervous diseases affect its muscles and its valves, throw it out of rhythm, and tend to shorten its usefulness."

Inefficiency of Government Ownership

IN an article in the *Nation's Business*, Herbert A. Casson, editor of *Efficiency Magazine*, London, shows very clearly that government ownership of utilities does not always work any too well in these days of speed, efficiency and economy. The following are some of the interesting facts set forth by Mr. Casson:

"In Great Britain the telephone is a high speed device that has been slowed down by 17 years of government ownership.

"It suits people who are not in a hurry. But it suits no one else. A London editor said recently, 'If you are in a hurry, don't telephone—walk.'

"New York City alone, has now as many telephones as the whole of England.

"The telephone traffic in London is only 10,400,000 calls a week. This is regarded in England as a surprisingly large figure; but it is two million less than the calls that are made in one day over the telephone lines of the New York Telephone Company alone.

"The United States has one telephone to every seven persons, while Britain has only one to every twenty-seven persons.

"As for telephone rates, they are slightly higher than American rates, and they are paid for a defective, 17 per cent service.

"When I ordered my house telephone I obtained it only after 136 days, whereas, the average time in New York City is, I believe, four and one-half days.

"The telephone department has no sales manager. It has no advertising manager. So far as I know, it employs no canvassers.

"If we look across the Atlantic we see a commercial company managing both telephones and telegraphs and giving the vast area of the United States a service which is incomparably more efficient than the service supplied by governments, either in Great Britain or in any other European country.

"Here we have a first class indication of what happens when the government attempts tc conduct a business enterprise—poor service, high rates, dissatisfied customers, and the entire nation deprived of a modern necessity—real telephone service."

THE REVIEWING STAND

New Developments in Electrical Measuring Devices

Serial Report, Meter Committee, Commercial National Section, N. E. L. A. Publication No. 289-47, 32 pp., 81 illustrations. Price, 50 cents; to members, 35 cents.

A RECENT survey by the Meter Committee is the basis for this descriptive report on improvements in measuring devices. To those interested in the accuracy of energy measurements, a subject that has received attention consistent with its important place in the industry, this report brings a complete review of recent developments, such as improvements in overload accuracy, temperature compensation, voltage variation and other electrical characteristics.

As pointed out in the committee's statement, this report reveals a tendency on the part of manufacturers toward standardization of terminal chambers and connections, as to size and position as authorized in a previous report of the Meter Committee, Publication No. 278-16.

The report is profusely illustrated, showing the latest types of watt-hour, volt-amperehour, load totalizing and frequency meters as well as demand registers, instrument transformers, portable standards, other graphic instruments and miscellaneous devices.—E. S. B.

Specifications

Serial report, Prime Movers Committee, Engineering National Section, N. E. L. A. Publication No. 289-49, 24 pp., 6 forms, 3 tables. Price, 40 cents; to members, 25 cents.

AS with previous reports on Specifications, the specification writer will find this report helpful in producing specifications which will clearly describe the equipment wanted and the performance expected of it under given conditions. The report includes a general outline and standard form for specifications for air preheaters, closed heaters and deaerating equipment. Material on certain related subjects also is included. This consists of a form for analysis of proposals, an index of generally accepted standards and lists of reports of investigations, all of which will be of particular interest to the specification writer or purchaser.—E. S. B.

Standards for Use in Design and Operation of Mechanical Power Plant Equipment

Serial Report, Prime Movers Committee, Engineering National Section, N. E. L. A. Publication No. 289-50, 20 pp. Price, 30 cents; to members, 20 cents.

FOR the immediate benefit of engineers interested in the design or operation of the mechanical equipment of power plants, a numerical list and alphabetical index of Standards have been compiled and published in serial report form. In making this listing available, the Prime Movers Committee has selected standards from those promulgated by several of the national bodies whose standardization work is most generally recognized and which seem to best cover the equipment and material in question. The functions of these various bodies is briefly described. For the convenience of those interested, a list is included of government publications, presenting the results of scientific and technical investigations and research made by the various Government Bureaus. Lists of Bulletins published by College Engineering Experiment Stations and American Welding Society Publications, relating to Mechanical Equipment of power plants, also are included.—E. S. B.

Storage, Handling, Treatment, Inspection and Testing of Insulating Oils

Serial report, Electrical Apparatus Committee, Engineering National Section, N. E. L. A. Publication, No. 289-48, 48 pp., 27 illustrations, 4 tables. Price, 75 cents: to members, 50 cents.

THE trend in practice for the storage and treatment of insulating oils is definitely shown in this serial report which has been particularly designed to serve as a convenient guide for engineers studying this subject. Based on the methods employed by fifty-seven representative operating companies the report shows the prevailing practice on various points and also outlines minority usage.

Actual figures are given showing the consensus of operating companies. The report is made extremely practical as a guide to the busy engineer by its method of summarizing in subcaptions the prevailing practice in regard to each subject discussed in the report.

A summary of prevailing practice throughout the United States is presented in addition to tables, data, appendices and actual layout of outstanding Oil Conditioning Plants.—E. S. B.

Coal and Ash Handling

Serial Report, Prime Movers Committee, Engineering National Section, N. E. L. A. Publication No. 289-43, 24 pp., 23 illustrations, 5 tables. Price, 40 cents; to members, 25 cents.

THE successful adoption by two companies of the molten slag method of removing pulverized fuel ash from the furnace is one of the most notable developments in the handling of coal and ash during the past year. This and other recent developments in methods and equipment used in coal and ash handling are described and illustrated in this report.

For stoker-fired boilers one member company gives complete maintenance costs for various types of ash hoppers and gates. Two statements are offered showing new coal handling equipment. Two member companies offer short statements on the commercial disposal of ash. A complete test is reported on a new coal distributor spout, and a statement is made regarding its operation.

The use of the drag scraper system for storing coal is steadily growing, the report shows. Statements from five manufacturers are given, covering, among other items, a motor-operated ash gate and a new vestibule-type ash hopper.—E. S. B.

Resuscitation by the Prone Pressure Method

A chart, Accident Prevention Committee, Engineering National Section, N. E. L. A. Publication No. 289-41. Three illustrations. Price: 1-9 copies 10 cents each; 10-99, 8 cents each; 100-499, 6 cents each; 500-999, 4 cents each; 1000 and more, 3 cents each. (Reduced prices for quantities apply only to one order, to one shipment, to one address, and are not cumulative.)

THIS illustrated chart briefly describes the procedure for resuscitation from electric shock, gas poisoning and drowning. It has been published as a supplement to the pamphlet, "First Aid and Resuscitation in Gas Poisoning, Electric Shock and Drowning" (NELA Pub. No. 278-57, now being revised) published jointly by the American Gas Association and the National Electric Light Association.

Printed in two colors, 12½ by 18 inches, on substantial paper, this chart is designed to arouse interest in the saving of lives by the Prone Pressure Method. By securing wide circulation within their territories for these charts, utility companies will make an important contribution to the public welfare. with attendant benefit to their own standing in the community.

A space has been left at the bottom of the chart for a one line imprint of the name of the distributing company. This imprinting may be done by the purchasing company, or, if desired, will be done by the N.E.L.A. at actual cost.—E. S. B.

Chains of Lightning. By Jonathan Brooks.

Bobbs-Merrill Co., Indianapolis, Ind.

CHAINS of Lightning is a public utility story by a man formerly connected with public utilities and in a capacity which gave him splendid opportunity from a commanding point of vantage to get a true perspective of the industry. He has been writing short stories for magazines for many years under the name of Jonathan Brooks. His real name is John Mellett and for some time he was director of the Indiana Committee on Public Utility Information. He resigned two years ago to devote all of his time to writing novels. This is his third novel and his first dealing with the public utility industry.

The author has absorbed, as no one can but do in the industry, its dominating spirit, service—service at any cost, service at any personal sacrifice. If it needs your body to stop a gap, that is what is expected of you and that is what the lineman freely offers. He may not know that a little infant is

(*Continued on page* 320)

ELECTRICANA

What Is Electricity?

"IT is very irritating to be asked so frequently 'What is electricity?'" writes the always entertaining "Meteor" in *Electrical Times,* London. "There is not the least possible excuse for the layman to be so ignorant of this simple matter, he has but to look it up in his dictionary. Here are the definitions in five popular dictionaries, Webster and the Oxford dictionary being first and second in the list:

(i) A power in nature, a manifestation of energy, exhibiting itself when in disturbed equilibrium or in activity by a circuit movement, the fact of direction in which involves polarity, or opposition of properties in opposite directions. . . . (There are 70 or 80 words more which are equally clear.)

(ii) Peculiar condition of the molecules of a body or of the surrounding ether developed by friction, chemical action, heat or magnetism.

(iii) The property of attracting and repelling light.

(iv) That power in bodies which attracts and repels substances.

(v) The name of the cause of certain phenomena of attraction and repulsion.

"Here are five perfectly clear and lucid definitions of electricity, and "Meteor" hopes that nobody will bother him with this childish question any more."

* * *

If there is still anybody too obtuse to understand, here are two more equally lucid definitions which might help, one from an American edition of Webster, the other from Funk & Wagnalls.

(vi) A dynamic material agency which, when in motion exhibits magnetic, chemical and thermal effects, and when at rest is accompanied by an interplay of forces between associated localities in which it is present.

(vii) The agency or force in nature, to which are due numerous phenomena, such as those observed when certain substances are rubbed or heated (attraction or repulsion) those in connection with moving magnets (as in production of electric light) and metallic circuits (as in telegraphy) those connected with various chemical actions (as in electrolysis), etc. These phenomena were formerly ascribed to the action of certain hypothetical media, or "fluids" but are now regarded as arising from strains or displacements in the luminiferous ether.

KITCHEN ENGINEERING

We called her "The Kitchen Mechanic"—
The cook that we hired of yore.
She baked tasty noodles, made succulent strudels
And toiled by the hot oven's door.
She fried and she roasted, she boiled and she toasted,
She did all her chores with a will.
Our Kitchen Mechanic was huge and Germanic
But had no mechanical skill!

But now in this age that's electric,
The kitchen in most of our homes
Is motored and wired, and she who is hired
Must know about currents and ohms.
With humble egg-beaters connected to meters,
With engines that ceaselessly throb
And gadgets galvanic, a Kitchen Mechanic
Instead of a cook gets the job!

—*Arthur L. Lippmann, in Judge.*

THAT INDOOR TAN CRAZE

Mary had a little lamp
With ultra vi'let ray:
She used it for a tan that she
Could get no other way.

She fell asleep one day beside
This artificial sun—
And now wherever Mary goes
They know she's too well done.

—H. I. Phillips.

HELPFUL HINTS DEPARTMENT

Phillips, who is the official wag of the New York *Sun,* also gives this information in his helpful column, The Sun Dial:

"The electric vibrator is now all the rage in physical culture cults, and this department is informed of a scofflaw who pours equal parts of gin, orange juice and bitters down his throat and then puts the vibrator belt around his tummy."

A NEW VERSION

"What's the trouble, son?" solicitously asked the electric lineman of his three-year-old boy.

"Daddy," answered the child, "I picked up a little bug, and one end wasn't insulated."—*Ex.*

Geographic Division Presidents

Canadian—P. S. GREGORY, Shawinigan Water & Power Co., Montreal, Canada

Eastern—F. R. PHILLIPS, Duquesne Light Co., Pittsburgh, Pa.

East Central—C. S. MACCALLA, Pennsylvania-Ohio Power & Light Co., Youngstown, Ohio

Great Lakes—J. E. JOHNSON, Illinois Power & Light Corp., Chicago, Ill.

Middle West—RALPH T. SMALLEY, Kansas Electric Power Co., Lawrence, Kan.

New England—IRVIN W. DAY, The Connecticut Light & Power Co., Waterbury, Conn.

North Central—L. M. PHARIS, Minnesota Power & Light Co., Duluth, Minn.

Northwest—R. M. BOYKIN, Puget Sound Power & Light Co., Seattle, Wash.

Pacific Coast—PAUL M. DOWNING, Pacific Gas & Electric Co., San Francisco, Cal.

Rocky Mountain—CLARE N. STANNARD, Public Service Co. of Colorado, Denver, Colo.

Southeastern—C. A. COLLIER, Georgia Power Co., Atlanta, Ga.

Southwestern—J. G. HOLTZCLAW, Gulf States Utilities Co., Beaumont, Tex.

PUBLIC POLICY COMMITTEE

Chairman, R. H. BALLARD, Southern California Edison Co., Los Angeles, Cal.

Vice-Chairman, W. W. FREEMAN, Columbia Gas & Electric Corp., New York, N. Y.

P. S. ARKWRIGHT, Georgia Power Co., Atlanta, Ga.

HENRY G. BRADLEE, Stone & Webster, Inc., Boston, Mass.

N. F. BRADY, The New York Edison Co., New York, N. Y.

B. C. COBB, Allied Power & Light Corp., New York, N. Y.

FRANK L. DAME, The North America Co., New York, N. Y.

J. E. DAVIDSON, Nebraska Power Co., Omaha, Neb.

HENRY L. DOHERTY, Henry L. Doherty & Co., New York, N. Y.

ALEX DOW, The Detroit Edison Co., Detroit, Mich.

CHARLES L. EDGAR, The Edison Electric Illuminating Co., Boston, Mass.

HALFORD ERICKSON, Byllesby Engineering & Management Corp., Chicago, Ill.

P. G. GOSSLER, Columbia Gas & Electric Corp., New York, N. Y.

A. R. GRAUSTEIN, International Paper Co., New York, N. Y.

FRANKLIN T. GRIFFITH, Portland Electric Power Co., Portland, Ore.

C. E. GROESBECK, Electric Bond & Share Co., New York, N. Y.

EDWIN GRUHL, The North American Co., New York, N. Y.

A. F. HOCKENBEAMER, Pacific Gas & Electric Co., San Francisco, Cal.

MARTIN J. INSULL, Middle West Utilities Co., Chicago, Ill.

SAMUEL INSULL, Commonwealth Edison Co., Chicago, Ill.

W. A. JONES, Henry L. Doherty & Co., New York, N. Y.

JOHN W. LIEB, The New York Edison Co., New York, N. Y.

THOMAS W. MARTIN, Alabama Power Co., Birmingham, Ala.

THOMAS N. MCCARTER, Public Service Electric & Gas Co., Newark, N. J.

JOHN B. MILLER, Southern California Edison Co., Los Angeles, Cal.

SIDNEY Z. MITCHELL, Electric Bond & Share Co., New York, N. Y.

THOMAS E. MURRAY, Thomas E. Murray, Inc., New York, N. Y.

J. J. O'BRIEN, H. M. Byllesby & Co., Chicago, Ill.

J. F. OWENS, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

R. F. PACK, Northern States Power Co., Minneapolis, Minn.

A. W. ROBERTSON, Westinghouse Electric & Manufacturing Co., New York, N. Y.

MARSHALL E. SAMPSELL, Central Illinois Public Service Co., Chicago, Ill.

H. T. SANDS, Electric Bond & Share Co., New York, N. Y.

PAUL A. SCHOELLKOPF, The Niagara Falls Power Co., Niagara Falls, N. Y.

M. S. SLOAN, The New York Edison Co., New York, N. Y.

FRANK W. SMITH, The United Electric Light & Power Co., New York, N. Y.

R. P. STEVENS, Allied Power & Light Corp., New York, N. Y.

FRANK M. TAIT, The Dayton Power & Light Co., Dayton, Ohio.

A. W. THOMPSON, West Chestnut Avenue, Chestnut Hill, Philadelphia, Pa.

GEORGE N. TIDD, American Gas & Electric Co., New York, N. Y.

HERBERT A. WAGNER, Consolidated Gas, Electric Light & Power Co., Baltimore, Md.

OWEN D. YOUNG, General Electric Co., New York, N. Y.

Public Relations National Section Representatives

JOHN F. GILCHRIST, Commonwealth Edison Co., Chicago, Ill.

T. A. KENNEY, Allied Power & Light Corp., New York, N. Y.

GUY W. TALBOT, Pacific Power & Light Co., Portland, Ore.

GEOGRAPHIC DIVISIONS STATE ASSOCIATIONS

CANADIAN DIVISION

(*Entire Dominion of Canada*)

Canadian Electrical Association

President, P. S. GREGORY, The Shawinigan Water & Power Co., Montreal, Can.; *Secretary,* H. M. LYSTER, Room 712, Power Bldg., Montreal, Can.

(*This Division Has No State* [*Provincial*] *Section*)

*EASTERN DIVISION

(*New Jersey, New York, Pennsylvania*)

President, F. R. PHILLIPS, Duquesne Light Co., Pittsburgh, Pa.; *Managing Director,* A. B. MILLAR, Telegraph Bldg., Harrisburg, Pa.

Empire State Gas and Electric Association

President, CHARLES S. RUFFNER, Mohawk-Hudson Power Corp., Albany, N. Y.; *Secretary,* CHARLES H. B. CHAPIN, 5618 Grand Central Terminal Bldg., New York, N. Y.

New Jersey Electric Association

President, C. H. HOWELL, Atlantic City Electric Co., Atlantic City, N. J.; *Secretary,* S. F. DELANY, Atlantic City Electric Co., Atlantic City, N. J.

Pennsylvania Electric Association

President, F. R. PHILLIPS, Duquesne Light Co., Pittsburgh, Pa.; *Managing Director,* A. B. MILLAR, Telegraph Bldg., Harrisburg, Pa.

EAST CENTRAL DIVISION

(*Kentucky, Ohio, West Virginia*)

President, C. S. MACCALLA, Pennsylvania-Ohio Power & Light Co., Youngstown, Ohio; *Secretary-Treasurer,* D. L. GASKILL, 603½ Broadway, Greenville, Ohio.

Kentucky Association of Public Utilities

President, SAMUEL RIDDLE, Louisville Railway Co., Louisville, Ky.; *Secretary,* E. F. KELLEY, Louisville Railway Co., Louisville, Ky.

Public Utilities Association of West Virginia

President, A. C. SPURR, Wheeling Traction Co., Wheeling, W. Va.; *Secretary,* A. BLISS MCCRUM, Box 1483, Charleston, W. Va.

GREAT LAKES DIVISION

(*Illinois, Indiana, Michigan, Wisconsin*)

President, J. E. JOHNSON, Illinois Power & Light Corp., Chicago, Ill.; *Secretary,* TOM C. POLK, 910 Marquette Bldg., Chicago, Ill.

Illinois State Electric Association

President, JULIUS L. HECHT, Public Service Co. of Northern Illinois, Chicago, Ill.; *Secretary-Treasurer,* GEORGE W. SCHWANER, 205 Illinois Mine Workers Bldg., Springfield, Ill.

Indiana Electric Light Association

President, NORMAN A. PERRY, Indianapolis Power & Light Co., Indianapolis, Ind.; *Secretary-Treasurer,* WILLIAM STOKES, 1548 Consolidated Bldg., Indianapolis, Ind.

Michigan Electric Light Association Section

President, HOWARD PETT, Consumers Power Co., Jackson, Mich.; *Secretary-Treasurer,* HERBERT SYLVESTER, The Detroit Edison Co., Ann Arbor, Mich.

Wisconsin Utilities Association

President, C. R. PHENICIE, Wisconsin Public Service Corp., Green Bay, Wis.; *Executive Secretary,* JOHN N. CADBY, Room 203, University Bldg., 432 Broadway, Milwaukee, Wis.

*MIDDLE ATLANTIC DIVISION

(*To Consist of Delaware, District of Columbia, Maryland, Virginia*)

Maryland Utilities Association

President, H. T. CONNOLLY, Washington, Baltimore & Annapolis Electric Railroad Company, Baltimore, Md.; *Secretary,* D. E. KINNEAR, United Railways & Electric Company, Baltimore, Md.

Public Utilities Association of Virginia

President, A. W. HIGGINS, Virginia Public Service Co., Charlottesville, Va.; *Secretary,* A. B. TUNIS, 301 East Grace Street, Richmond, Va.

MIDDLE WEST DIVISION

(Iowa, Kansas, Missouri, Nebraska)

President, RALPH T. SMALLEY, Kansas Electric Power Co., Lawrence, Kan.; *Managing Director*, THORNE BROWNE, 1527 Sharp Bldg., Lincoln, Neb.

Iowa Section

President, C. S. MACY, Iowa Power & Light Co., Adel, Iowa; *Secretary-Treasurer*, H. E. WEEKS, Tri-City Railway & Light Co., Davenport, Iowa.

Kansas Section

President, FRANK M. STONE, Kansas Utilities Co., Fort Scott, Kan.; *Secretary*, H. LEE JONES, 820 Kansas Avenue, Topeka, Kan.

Missouri Association of Public Utilities

President, A. E. REYNOLDS, Springfield Gas & Electric Co., Springfield, Mo.; *Secretary-Treasurer*, F. D. BEARDSLEE, 315 North Twelfth Street, St. Louis, Mo.

Nebraska Section

President, C. W. AMIDON, Central Power Co., Grand Island, Neb.; *Managing Director*, THORNE BROWNE, 1527 Sharp Bldg., Lincoln, Neb.

NEW ENGLAND DIVISION

(Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont)

President, IRVIN W. DAY, The Connecticut Light & Power Co., Waterbury, Conn.; *Secretary*, Miss O. A. BURSIEL, Room 1113 Statler Bldg., 20 Providence Street, Boston, Mass.

(This Division Has No State Sections)

NORTH CENTRAL DIVISION

(Minnesota, North Dakota, South Dakota)

North Central Electric Association

President, L. M. PHARIS, Minnesota Power & Light Co., Duluth, Minn.; *Secretary*, JOHN W. LAPHAM, 803-804 Plymouth Bldg., Minneapolis, Minn.

(This Division Has No State Sections)

NORTHWEST DIVISION

(Alaska, Idaho, Montana, Oregon, Utah, Washington)

Northwest Electric Light and Power Association

President, R. M. BOYKIN, Pudget Sound Power & Light Co., Seattle, Wash.; *Secretary*, BERKELEY SNOW, Room 1206, Spaulding Bldg., Portland, Ore.

(This Division Has No State Sections)

PACIFIC COAST DIVISION

(Arizona, California, Hawaii, Nevada, Philippine Islands)

Pacific Coast Electrical Association

President, PAUL M. DOWNING, Pacific Gas & Electric Co., San Francisco, Cal.; *Secretary*, SAMUEL H. TAYLOR, Suite 729-730, 447 Sutter Street, San Francisco, Cal.

Arizona Utilities Association

President, M. A. POOLER, Tucson Gas, Electric Light & Power Co., Tucson, Ariz.; *Secretary*, L. C. McCULLOUGH, 134 South Central Avenue, Phoenix, Ariz.

ROCKY MOUNTAIN DIVISION

(Colorado, New Mexico, Wyoming)

President, CLARE N. STANNARD, Public Service Co. of Colorado, Denver, Colo.; *Secretary*, O. A. WELLER, Public Service Co. of Colorado, Denver, Colo.

The Colorado Utilities Association

President, V. L. BOARD, Public Service Co. of Colo., Denver, Colo.; *Secretary*, O. A. WELLER, Public Service Co. of Colo., Denver, Colo.

New Mexico Utilities Association

President, W. W. NIELSEN, New Mexico Power Co., Santa Fe, N. M.; *Secretary-Treasurer*, BERNARD L. WILES, Albuquerque Gas & Electric Co., Albuquerque, N. M.

Wyoming Utilities Association

President, W. D. JOHNSTONE, Mountain States Power Co., Casper, Wyo.; *Secretary*, F. A. PROBST, Mountain States Telephone & Telegraph Co., Casper, Wyo.

SOUTHEASTERN DIVISION

(Alabama, Cuba, Florida, Georgia, North Carolina, South Carolina, Tennessee, Porto Rico)

President, C. A. COLLIER, Georgia Power Co., Atlanta, Ga.; *Secretary*, C. M. KILIAN, 207-8 Bona Allen Bldg., Atlanta, Ga.

SOUTHWESTERN DIVISION

(Arkansas, Louisiana, Mississippi, Oklahoma, Texas)

President, J. G. HOLTZCLAW, Gulf States Utilities Co., Beaumont, Tex.; *Secretary*, S. J. BALLINGER, San Antonio Public Service Co., San Antonio, Tex.

Arkansas Utilities Association

President, W. E. BANN, Southwestern Gas & Electric Co., Texarkana, Tex.; *Secretary*, R. I. BROWN, Arkansas Central Power Co., Little Rock, Ark.

Mississippi Electric League

President, A. H. JONES, Jones-Johnson Co., McComb, Miss.; *Secretary*, A. R. RIDDICK, A. G. Riddick, Inc., Jackson, Miss.

Oklahoma Utilities Association

President, L. W. SCHERER, United Telephone Corp., Watonga, Okla.; *Secretary*, EDWARD F. McKAY, 1020 Petroleum Bldg., Oklahoma City, Okla.

Southwestern Public Service Association

President, W. H. BURKE, Stone & Webster, Inc., Houston, Tex.; *Secretary*, E. N. WILLIS, 403 Slaughter Bldg., Dallas, Tex.

***Note: This Division is in Process of Formation.**

SECTIONS, BUREAUS AND COMMITTEES

Chairmen's names only listed here

SPECIAL NATIONAL COMMITTEES

Advertising Committee—FRANK LEROY BLANCHARD, Henry L. Doherty & Co., New York, N. Y.

Charles A. Coffin Prize Committee—P. S. ARKWRIGHT, Georgia Power Co., Atlanta, Ga.

Codes and Standards Committee—IRVIN W. DAY, The Connecticut Light & Power Co., Waterbury, Conn.

Constitution and By-Laws Committee—R. F. PACK, Northern States Power Co., Minneapolis, Minn.

Electrification of Steam Railroads Committee—BRITTON I. BUDD, Public Service Co. of Northern Illinois, Chicago, Ill.

Exhibition Committee—E. W. GOLDSCHMIDT, Wagner Electric Corp., New York, N. Y.

Finance Committee—SIDNEY Z. MITCHELL, Electric Bond & Share Co., New York, N. Y.

Lamp Committee—FRANK W. SMITH, The United Electric Light & Power Co., New York, N. Y.

Prize Awards Committee—W. H. ONKEN, JR., *Electrical World*, New York, N. Y.

Public Policy Committee—R. H. BALLARD, Southern California Edison Co., Los Angeles, Cal.

Rate Research Committee—L. R. NASH, Stone & Webster, Inc., Boston, Mass.

Water Power Development Committee—PAUL A. SCHOELLKOPF, The Niagara Falls Power Co., Niagara Falls, N. Y.

Wiring Policy Committee—J. E. DAVIDSON, Nebraska Power Co., Omaha, Neb.

GENERAL NATIONAL COMMITTEES

***Civic Development Committee**—JOHN B. REYNOLDS, Middle West Utilities Co., Chicago, Ill.

***Educational Committee**—FRED R. JENKINS, Commonwealth Edison Co., Chicago, Ill.

***Insurance Committee**—W. H. SAWYER, Allied Power & Light Co., New York, N. Y.

***Membership Committee**—HOWARD K. MOHR, The Philadelphia Electric Co., Philadelphia, Pa.

***Rural Electric Service Committee**—CHARLES F. STUART, Northern States Power Co., Minneapolis, Minn.

ACCOUNTING NATIONAL SECTION

***Section's Executive Committee**—J. F. FORD, The Philadelphia Electric Co., Philadelphia, Pa.

Budget Committee—B. S. RODEY, JR., The United Electric Light & Power Co., New York, N. Y.

***Classification of Accounts Committee**—H. C. HASBROUCK, H. C. Hopson & Co., New York, N. Y.

Corporate Finance Committee—O. E. McCORMICK, Middle West Utilities Co., Chicago, Ill.

***Customers' Records Committee** — DOUGLAS BROWN, New York & Queens Electric Light & Power Co., Long Island City, N. Y.

***Fixed Capital Committee**—J. A. ROCKWOOD, Portland Electric Power Co., Portland, Ore.

***General Records Committee**—K. B. CRUMB, American Gas & Electric Co., New York, N. Y.

***Purchasing and Storeroom Committee**—W. G. YOUNG, New York & Queens Electric Light & Power Co., Long Island City, N. Y.

***Statistics Committee**—HARRY A. SNOW, The Detroit Edison Co., Detroit, Mich.

COMMERCIAL NATIONAL SECTION

***Section's Executive Committee**—MARSHALL E. SAMPSELL, Central Illinois Public Service Co., Chicago, Ill.

***Commercial and Industrial Power and Heating Bureau**—V. M. F. TALLMAN, Charles H. Tenney & Co., Boston, Mass.

Commercial Cooking Committee—O. WILHELMY, The Union Gas & Electric Co., Cincinnati, Ohio.

Electric Truck Committee—GUY W. THOMAS, Public Service Co. of Colorado, Denver, Colo.

General Power Committee—H. C. THUERK, Erie Lighting Co., Erie, Pa.

Industrial Heating Committee—J. L. FADEN, The Edison Electric Illuminating Co., Boston, Mass.

***Lighting Bureau**—T. O. KENNEDY, The Ohio Public Service Co., Cleveland, Ohio.

Commercial and Industrial Lighting Committee—J. DANIELS, The Edison Electric Illuminating Co., Boston, Mass.

Electrical Advertising Committee—C. J. EATON, Middle West Utilities Co., Chicago, Ill.

Home Lighting Committee—W. T. BLACKWELL, Public Service Electric & Gas Co., Newark, N. J.

Street Lighting Committee—R. J. MALCOMSON, Public Service Co. of Northern Illinois, Chicago, Ill.

***Merchandising Bureau**—FRANK D. PEMBLETON, Public Service Electric & Gas Co., Newark, N. J.

Domestic Electric Range Committee—F. A. COUPAL, Buffalo, Niagara & Eastern Power Corp., Buffalo, N. Y.

Merchandise Sales Committee—C. L. HAROLD, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

Refrigeration Committee—C. L. DUNN, The Ohio Public Service Co., Cleveland, Ohio.

Water Heating Committee—NORMAN T. WILCOX, Stone & Webster, Inc., Boston, Mass.

***Customer Relations Committee**—H. T. EAST, Public Service Co. of Northern Illinois, Chicago, Ill.

Promotional Rates Committee—E. W. LLOYD, Commonwealth Edison Co., Chicago, Ill.

***Wiring Sales Committee**—A. P. GOOD, Commonwealth Edison Co., Chicago, Ill.

ENGINEERING NATIONAL SECTION

***Section's Executive Committee**—E. C. STONE, Duquesne Light Co., Pittsburgh, Pa.

***Accident Prevention Committee**—C. R. BEARDSLEY, Brooklyn Edison Co., Inc., Brooklyn, N. Y.

***Electrical Apparatus Committee**—J. A. JOHNSON, The Niagara Falls Power Co., Niagara Falls, N. Y.

Engineering Administration Committee—H. P. LIVERSIDGE, The Philadelphia Electric Co., Philadelphia, Pa.

***Hydraulic Power Committee**—BYRON E. WHITE, Utica Gas & Electric Co., Utica, N. Y.

***Inductive Coordination Committee**—H. L. WILLS, Georgia Power Co., Atlanta, Ga.

***Meter Committee**—E. E. HILL, The New York Edison Co., New York, N. Y.

***Overhead Systems Committee**—HAROLD COLE, The Detroit Edison Co., Detroit, Mich.

***Power System Engineering Committee**—L. W. W. MORROW, *Electrical World*, New York, N. Y.

***Prime Movers Committee**—E. B. RICKETTS, The New York Edison Co., New York, N. Y.

Special Engineering Research Committee—C. F. HIRSHFELD, The Detroit Edison Co, Detroit, Mich.

***Underground Systems Committee**—J. W. SYLVESTER, The Philadelphia Electric Co., Philadelphia, Pa.

Public Relations National Section

***Section's Executive Committee**—J. F. Owens, Oklahoma Gas & Electric Co., Oklahoma City, Okla.

***Cooperation with Educational Institutions**—Carl D. Jackson, 36 West 44th Street, New York, N. Y.

***Customer Ownership**—W. H. Hodge, Byllesby Engineering & Management Corp., Chicago, Ill.

***Industrial Relations Committee**—Homer E. Niesz, Commonwealth Edison Co., Chicago, Ill.

***Information Bureau Organizations Committee**—T. A. Kenney, Allied Power & Light Corp., New York, N. Y.

Manufacturers' Advertising Committee—T. J. McManis, General Electric Co., Schenectady, N. Y.

***Public Speaking Committee**—W. S. Vivian, Middle West Utilities Co., Chicago, Ill.

***Relations with Financial Institutions Committee**—A. W. Robertson, Westinghouse Electric & Manufacturing Co., New York, N. Y.

***Women's Committee**—Miss Sophia Malicki, Middle West Utilities Co., Chicago, Ill.

***Provision is made for a representative from each Geographic Division.**

CONVENTIONS AND MEETINGS

Meeting of the Section, Bureaus and Committees of the National Electric Light Association are shown in roman type; those of other associations in italics

1929

May

7–9 ***American Institute of Electrical Engineers, Regional Meeting, Dallas, Texas.***

7–10 East Central Geographic Division, Brown Hotel, Louisville, Ky.

8–10 Southeastern Geographic Division, Asheville, N. C.

13–15 ***American Society of Mechanical Engineers, Rochester, N. Y.***

13–16 ***National Fire Protection Association, Memphis, Tenn.***

13–16 ***National Fire Protection Association, Memphis, Tenn.***

13–24 Industrial Heating School, Case School of Applied Science, Cleveland, Ohio.

16–17 Commercial Section, Eastern Geographic Division, Benjamin Franklin Hotel, Philadelphia, Pa.

16–18 Missouri Association of Public Utilities, Sadalia, Mo.

20–25 ***National Electrical Manufacturers Association, The Homestead, Hot Springs, Va.***

27–31 ***National Electrical Wholesalers Association, The Homestead, Hot Springs, Va.***

27–31 ***General Federation of Women's Clubs, Swampscott, Mass.***

31 Commercial Section, Great Lakes Geographic Division, Indianapolis, Ind.

June

3 Women's Committee, 2.30 p. m., Garden Lounge, Dennis Hotel, Atlantic City, N. J.

3 Accident Prevention Committee, 9.30 a. m., Traymore Hotel, Atlantic City, N. J.

3 National Executive Committee, luncheon-meeting, 1 p. m., Ballroom, Ritz-Carlton Hotel, Atlantic City, N. J.

3 Rural Electric Service Committee, 2.30 p. m., Traymore Hotel, Atlantic City, N. J.

3 Rate Research Committee, Traymore Hotel, Atlantic City, N. J.

3 Accounting National Section, Executive Committee, 3 p. m., Westminster Hall, Chelsea Hotel, Atlantic City, N. J.

3 Commercial National Section, Executive Committee, 3 p. m., Room No. 2, Ritz-Carlton Hotel, Atlantic City, N. J.

3 Engineering National Section, Executive Committee, 3 p. m., Room No. 1, Ritz-Carlton Hotel, Atlantic City, N. J.

3 Public Relations National Section, Executive Committee, 3 p. m., Ballroom, Ritz-Carlton Hotel, Atlantic City, N. J.

3–7 Annual Convention and Exhibition, NATIONAL ELECTRIC LIGHT ASSOCIATION, Municipal Auditorium, Atlantic City, N. J.

4 ***Board of Directors, Society for Electrical Development, Traymore Hotel, Atlantic City, N. J.***

5 Class "D" Members (Manufacturers), 12.30 p. m., Municipal Auditorium, Atlantic City, N. J.

5 State Public Utility Information Directors, 1 p. m., Club Room, Hotel Traymore, Atlantic City, N. J.

6 Public Policy Committee, luncheon-meeting, 1 p. m., Ballroom, Ritz-Carlton Hotel, Atlantic City, N. J.

10–15 ***Westinghouse Agent-Jobber's Association, The Homestead, Hot Springs, Va.***

14 ***Board of Directors, Society for Electrical Development, New York, N. Y.***

16–18 North Central Geographic Division, Breezy Point Summer Resort, Pequot, Minn.

18–21 ***Society of Automotive Engineers, New York, N. Y.***

19–21 Canadian Geographic Division, Algonquin Hotel, St. Andrews-by-the-Sea, N. B.

19–22 Pacific Coast Geographic Division, Del Monte, Cal.

20–21 Accounting Section, Wisconsin Utilities Association, Sheboygan, Wis.

24–28 ***American Society for Testing Material, Atlantic City, N. J.***

24–28 ***American Institute of Electrical Engineers, Swampscott, Mass.***

26–29 Northwest Geographic Division, Seattle, Wash.

July

1–4 ***American Society of Mechanical Engineers, Salt Lake City, Utah***

1–5 ***American Home Economics Association Convention and Exhibition, Statler Hotel, Boston, Mass.***

18–19 Electric Section, Wisconsin Utilities Association, Hotel Wausau, Wausau, Wis.

August

27–30 ***National Association of Railroad and Utilities Commissioners, Glacier National Park Hotel, Glacier National Park, Mont.***

September

4–6 Pennsylvania Electric Association, Bedford Springs Hotel, Bedford Springs, Pa.

9–11 Rocky Mountain Geographic Division Hotel Colorado, Glenwood Springs, Colo.

9–12 New England Geographic Division, Hotel Griswold, New London, Conn.

9–13 ***American Society for Steel Treating, Cleveland, Ohio.***

9–14—***Association of Edison Illuminating Companies, Quebec, Canada.***

19–20 Empire State Gas and Electric Association, Saranac Inn, Saranac Lake, N. Y.

23–30 ***American Electric Railway Association Convention and Exhibit, Municipal Auditorium, Atlantic City, N. J.***

30 ***National Safety Council, Stevens Hotel, Chicago, Ill.***

October

1–4 ***American Electric Railway Association Convention and Exhibit, Atlantic City Auditorium, Atlantic City, N. J.***

1–4 ***National Safety Council, Stevens Hotel, Chicago, Ill.***

7–10 ***Third National Fuels Meeting, American Society of Mechanical Engineers, Bellevue-Stratford Hotel, Philadelphia, Pa.***

14–18 ***American Gas Association, Atlantic City, N. J.***

NEW MEMBERS

Employees of Electric Light and Power Companies (Class B)

Alabama, River Falls, River Falls Power Company
  Chas. L. Thesing
Arizona, Tucson, The Tucson Gas Electric Light & Power Co.
  A. E. Morrison
California, Fresno, San Joaquin Light & Power Corp.
  F. C. Foy

Chains of Lightning

(*Continued from page* 315)

depending on the invisible juice to keep life fluttering, he may not know that a vital industry is depending on its unceasing flow. Maybe nothing depends on it for the moment. All may be in bed asleep and comfortable. But it is not his business to stop and find out. His job is to keep the unseen atoms pulsating.

Thomas O'Neill, grizzled veteran, is the guardian of the service in a mountain city. One can see the light of battle in the old man's eye as he heads his crew at midnight in mid-winter through a blizzard across mountains to find two parted wires. O'Neill is one of those "To-hell-with-them" Irish, whose prototypes of any race we encounter in every trouble shooting line gang, loyal to their job and to their company, expressing it possibly too forcibly sometimes by a crack on the jaw of its detractor.

Facing everything that O'Neill and his trouble shooters have faced in the way of material danger and facing in addition the problem of keeping the vast network of companies functioning and fed with the sinews of capital, Jase Wheeler rises a mighty figure. Damned, villified, suspected, Jase, too, keeps the juice flowing. At the head of the vast organization it is his job to keep the investment funds pouring into the industry, to keep the intricate mechanism operating and expanding, to keep the costs of service trending downward in order to invade new fields. Jase has found that his best weapon is to ignore the villifiers who nibble at his toes, the grafters, the evangelists wearing tinsel halos and breathing and spreading hate and envy and rancor.

A charming love story forming a vital part pervades the novel.

The lesson to the public utility man is "Don't let them get your goat." Maybe you will go down to your grave followed by snarls of invective.

But keep the juice flowing.—J. C.

THE PRESIDENT'S PAGE

Hail and Farewell

AS President of the National Electric Light Association, I have run my course. I have tried to keep the faith.

Without reference to where the credit belongs, the Association is in better condition at the end of the year. Naturally, it progresses, it improves each succeeding year. But, it seems to me, there is more spirit of cooperation among the membership, more willingness for each to give of his best for the benefit of all, a greater determination to render more general, more economical and more useful service.

The office of the President of the National Association is one of distinction and honor. I have had great pride in holding it. I will cherish the memory of it.

All over the United States I have had the privilege of meeting and mingling with the people engaged in this industry. My admiration for them is unbounded. They are men and women of outstanding character, integrity and high ideals, persistently seeking to do an increasingly better and more serviceable job.

They have been kind, considerate and generous to me. As recompense, I relinquish the Presidency of their Association to a better man. I bid you farewell and thank you from the bottom of my heart for your partiality and kindness.

P S Arkwright

President.

N·E·L·A· BULLETIN

Entered as Second Class Matter Jan. 28, 1914, at the Post Office, New York, N. Y., under the Act of March 3, 1879.

Published monthly at 420 Lexington Ave., New York, N. Y., by the

NATIONAL ELECTRIC LIGHT ASSOCIATION

A Voluntary Organization of Companies Engaged In, and Individuals Affiliated With, or Interested In, the Electric Light and Power Industry: "Organized to Advance the Art and Science of the Production, Distribution and Use of Electrical Energy for Light, Heat and Power for Public Service."
